INDEX.

NOTE.—The figures in parentheses have reference to pages in Supplements.

A

Aberavon Bridge, 676
Aberdeen Water Supply, 298, 315
Accumulator-Propelled Vehicles, 564
Action against Council and Contractors, 387
Advertising, Up-to-date, 26
Air Space above Streets, 27
American Public Health Association: Progress Report, 56
Analytical Methods, Sewage Works Operation and, 3, 4
An Attractive Appointment, 400

Annual Reports:—
Camberwell, 442
Frome, 206, 365
Guildford, 387
North Riding, 665
Nuneaton, 546, 575
St. Austell, 437
Skegness, 667, 679
Somerset, 19
Staffordshire, 701
Upper Renfrewshire, 771

Appointments, The War and, 429
Arch Calculation, Some Modern Methods of, 205
Architect, Law as to the Remuneration of the, 428
Architects, Registration of, 55
A Red Christmas, 1
Army Sanitation, Local Authorities and, 526
Articled Pupils, Surveyors and, 345, 347
Asphalt in Sanitary Work, 633

Assistants' and Students' Section:—
Applied Mathematics, 358, 383
Bridge Construction, 764
Building Construction, 236, 570
Cement Testing, 68
Destructors, Forced Draught, 466
Fireproof Construction, 301
Foundations, 270
Geodesy, 36
Girder Design, 438, 466, 491
Hydraulics, 15, 203, 330, 601
Hydrostatics, 764
Levelling, 627, 650
Masonry Arch, 415
Projectiles, 330, 358
Reservoir Dam, 703
Road Making, 547
Roof Truss, 68, 98, 677
Sewage Sprinklers, 383, 547
Sewer Survey, 704, 730
Specific Gravity and Bushel-weight Tests for Portland Cement, 204
Statics, 518
Strength of Materials, 300
Structures, 492
Testing Materials, 270, 650, 677
Vector, 601
Water Towers, 730
Wells, 236

Association of Consulting Engineers:—
Annual General Meeting, 732

Association of Somerset Surveyors:—
Annual Meeting at Bristol, 199
Atherstone Council's Stone Contract, 603
Auckland, N.Z., Main Drainage, 436
Australia's Capital City, 499
Automatic Sprinklers, Fire Tests with, 505
Ayrshire, Ferro-Concrete Bridge Building in, 467

B

Back-to-Back Houses, 640
Ballymena Rural District Council and their Engineer, 417
Baltic Timber Trade, 100
Baltimore Activated Sludge Experiments, 693
Barking and Crossness Outfalls, 271
Bathing Pavilion, Cape Town, 506
Bathing Pavilions, 402
Battersea Street Accident, 316
Bermondsey, Refuse Disposal in, 410
Berwick Sanitary Inspector and the Typewriter, 717
Billeting and the Expenditure of Local Authorities, 301
Billeting Troops in Towns and Villages, 199
Bituminous Material in Road Construction, Use of, 412
Bituminous Materials for Road Construction, 348
Bituminous Road Construction, 326
Bituminised Earth Paving, 655
Bleach, Print, and Dye Works Waste Liquors, Treatment of, 497
Bolivia, Bridge Construction in, 92
Borough Surveyor's "Unclean" Offices, 297
Bradford Replanning Competition, 628
Brewery Wastes, Purification of, 293
Bridge Work in 1914, 114
Bristol Tramways Purchase, 520
British Columbia, Highways in, 587
British Standard Rolled Sections, 57
Building By-Laws and a Court of Appeal, 255, 260
Building Regulation in Shanghai, 596
Buildings, Height of, 411
Buildings, New, 687
Burst Water Mains, 81

C

Calculations on Concrete, 286
Camping Ground, Selecting a, 87
Camp Kitchens, 87
Canada, Street Cleansing in, 431
Capetown Bathing Pavilion, 506
Care of Roadside Grips, 305
Cast Iron or Steel Pipes, 257
Chemical Fire Extinguishers, Portable, 26
China Clay Works, Quarry and Coal Washing Wastes, 346
Chiswick, Fire Protection at, 596
Chiswick Traffic Census, 7
City of London Engineership, 189
Civic Art, Municipal Practice of, 440
Civic Design, Liverpool Chair of, 501
Civic Surveys, Proposed, 428
Clay Foundations, Supporting Power of, 62
Clay, Lateral Pressure and Resistance of, 62
Cole, Presentation to Mr. Thomas, 255, 268
Compulsory Purchase of Land, 25
Concrete and Weather, 347
Concrete, Calculations on, 286
Concrete, Failures in, 663
Concrete in Modern Sanitation, 55, 58

Concrete Institute:—
Annual General Meeting, 626
Concrete, Mixing of, 366
Concrete Roads *v.* Concrete Foundations, 90
Concrete, Temperature Changes in Mass, 683
Concrete Tubes, Manufacture of, 237
Constantinople's Firemen, 213
Construction of Sewers, 315, 319
Contractors, Protection of, 616
Convertible Roller Tractor, 673
Co-operation in Town Planning Schemes 753, 780
Co-ordination of Military and Civil Sanitary Services, 799
Cornwall, Isolation Hospital Accommodation in, 461

Correspondence:—
Baltic Timber Trade, The, 109
Bitumen, 672
Charging for Water Supply, 8
Chiswick Traffic Census, 7
Direction Posts, 440
Earthworks, 67
Electrically-driven Dust Vans, 295
Electrolysis of Pipes, 441
Elephants for Road Making, 416
Flies and Excreta, 540
Householders and Fires due to Air Raids, 738
Insects and Disease, 493
Kit Rack for Red Cross Hospitals, 207

Madras City Waterworks, Design of, 572
Manufacture of Concrete Tubes, 237
Massachusetts State Department of Health, 207
Municipal Practice of Civic Art, 440
Notts County Surveyorship, 651
Prevention of Corrosion, 599
Professional Men and the War, 44, 100
Purification of Dairy Wastes, 7
Recent Circumstances Affecting Roads, 295, 357, 382
Recruiting for the Forces, 440
Road Terms, 441
Safeguards against Enteric, 237
Sewage Treatment by Aëration, 8
Superannuation, 295
Surveyors' Salaries, 67
Wind Pressure, 416
Corrosion of Iron and Steel, 532, 536, 566, 599

Cottages for Rural Districts, 354
Coventry's Growth, 66
Councillors and Road Maintenance, 405
Council School Spray Baths, 307
County Councils and Hospitals, 211
County Councils Association and Heavy Traffic, 616
Cremation, Progress of, 377
Crystal Palace Engineering Society, 543
Cudworth Councillors and Conference Expenses, 741
Cumberland Roads and Bridges, 227

D

Damage to Roads: Expert Committee Appointed, 394
Decayed Workers, Dublin Corporation and, 588
Definitions of Road Terms, 406
Departmental Competition at Walsall, 54
Deptford Slipper Baths Scheme, 434
Destructor Clinker Pavements, 57
Direction Posts, 352, 440
Disposal of Domestic and Trade Refuse, 410
Disposal of Liquid Wastes, 478
Domestic Electricity, 533
Drain Clearing Rods, Locking Joint for, 95
Drawing Boards, Care of, 655
Drifting Sand Filter, 612
Dry Closets: Royal Commission's Recommendations, 504
Dry Closets, 664, 669
Dublin Corporation and Decayed Workers, 588
Dublin Housing, 531

modation for persons of the working class, and that in districts in respect of which we are asked to sanction loans for the provision of such accommodation under Part III. of the Act of 1890 the provision of the dwellings is generally proposed as a course precedent to and not subsequent to the closure of insanitary houses." That part of the report concerned with the building of houses by local authorities will be dealt with in a separate article next week.

* * *

War and the Pollution of Water Supplies.

An entirely new condition has arisen in this country as the result of the present war, and it is one to which we wish to call the serious attention of all water engineers and others interested in safeguarding our water supplies. At the present time in all parts of the country large camps are being established for the accommodation in various places of hundreds of thousands of men and possibly for the future accommodation of millions. In some cases the men still live under canvas, but the policy of constructing permanent buildings of corrugated iron has been adopted, so that it is quite evident that settlements of a permanent character will be established. In travelling through the country by road in almost any direction one comes across these Government establishments in the most unexpected places. Further, we find hospitals for the sick and wounded which have been hurriedly constructed, or hotels and other buildings which have been adapted for the purpose. It is clear in the first place that where there is a permanent settlement with a population reckoned by tens of thousands a large water supply is a necessary preliminary, and that a daily flow of sewage of considerable volume must be produced. This sewage must be dealt with hurriedly, and it is inevitable that at a very early stage drainage and sewage disposal must become necessary. The difficulty of hastily providing such arrangements for a camp of, say, 30,000 soldiers must be very great, and we are at once faced with the absolute certainty of the pollution of rivers and of sources of water supply suddenly at all sorts of unexpected places.

It is unnecessary to go into the matter in great detail, as each engineer has probably an object lesson in his own district. Such possibilities of contamination cannot be avoided. One cannot expect that in war-time, under conditions entirely new, when all kinds of unusual difficulties as to the carriage of material, the employment of labour and the supervision of work have to be faced, the sewage of camps and temporary hospitals will be treated immediately upon the best and most approved principles. The time available is insufficient to make such treatment possible at the outset. Pollution of supplies cannot be prevented, but on the other hand, happily, it is possible by the intelligent application of modern methods to treat water in such a manner that, however serious the pollution may be, such pollution may be entirely removed, so that it may be rendered safe for the consumer. If, therefore, any sickness or trouble results from the new conditions brought about by the war, as referred to above, the water authorities will be entirely to blame. The War Office has grasped the importance of sterilising the water supplied to the troops, as did the Japanese in their great war with Russia, when for the first time in history the proportion of the sick to the wounded was reversed. We hear of the steps taken by the Government thus to purify the water supplied to the soldiers, but we also hear of something better made by the contractors to build retreats of the Army, and that although many of the men are enduring great discomfort and hardship owing to the wet weather and to the difficulties inseparable from the sudden call to arms. If it is thus possible suddenly and unfailingly to produce large supplies of pure water to the troops, it should be plain that there can be no possible excuse for any water authority supplying polluted water to its consumers.

We see that the chances of pollution are greatly increased, and it follows that there ought to be an increased vigilance on the part of the water authorities. It is essential that constant examinations should be made, and that steps should be taken in order that such treatment as may be found to be necessary may be ready for immediate application. It is only by such vigilance that we can hope to escape from serious danger. It should be remembered that as time goes on the chances of enteric patients entering the hospitals must increase; we may also have wounded soldiers of other nations, who may well be carriers of disease. We hear of typhoid and cholera at the Front, and we must be prepared as the year advances to hear of more, and to be ready to deal with cases occurring at home. Many of the camps and hospitals exist in rural districts where water is derived from surface wells, and here the case is one to which the local authority must look with the greatest care. Let it not be imagined that earth treatment is an unfailing remedy. Where the excretion of thousands of men is daily dumped on to the ground in a mass in any form there will be acute danger of the rain water washing pollution into the sources of supply. The greatest care should therefore be exercised in the cartage of this material and in its disposal. Such matters are liable to be overlooked till trouble occurs. The present danger is therefore acute.

* * *

Rationé Tenuræ Roads.

Having regard to the resolution recently passed by the Annual Conference of Rural District Councils (referred to at p. 567 *ante*), as to the necessity for legislation dealing with the question of *ratione tenuræ* roads, it may be of interest to consider briefly the principles of the liability for the repair of such roads, and the powers of highway authorities with regard to them. In the first place, the nature of the liability is a matter of some uncertainty. Some authorities have held that it is a species of prescription or immemorial usage, others that it may be regarded as a condition annexed to the grant of lands, whether by a subject or by the Crown. But this point is somewhat academic. A more practical question is how can the liability be proved to exist in a particular case. No hard-and-fast rule can be laid down applicable to all cases, but there is authority for saying that if an occupier of land and his predecessors have for a great length of time actually repaired a highway, this, in the absence of explanation, will be almost conclusive. At all events, it will give rise to a strong presumption. But there may be circumstances which will rebut the presumption, such as proof that the repairs were done under a mistaken notion of liability, or that the repairs were ex gratia, and were done on the occupier's land. It would appear, too, that if it can be shown that the liability originated within the time of legal memory (that is to say, after the first year of the reign of Richard I.), this is fatal, because it negatives the theory of immemorial usage on which the presumption rests. This is illustrated by a case in which a road had been repaired by the occupiers of certain land as far back as being within living memory, but this road was on the top of a hill, consisting of earth excavated from the top and down which it had been made, and was clearly of a grant of the land by Charles I. Therefore the presumption of liability was rebutted (*Rex v. Hudd*, 4 B. & A. 73). As to the person

Sewage Works Operation and Analytical Methods.

Patriotism or ?

Sewage Works Operation and Analytical Methods.

Appointed in 1913 to deal with the question of analytical methods employed in connection with sewage works operation, a committee of the Sanitary Engineering section of the American Public Health Association have recently presented a progress report, which we reproduce herewith with a cordial invitation to our readers either to discuss the suggested outline of tests in our columns or to communicate their views to the chairman of the committee, Mr. W. L. Stevenson, whose address is 412 City Hall, Philadelphia. The personnel of the committee is as follows:—Mr. C. B. Hoover, chemist-in-charge of the sewage treatment works of Columbus, Ohio; Mr. H. C. McRae, division engineer in charge of the sewage treatment works of Baltimore; Mr. Langdon Pearse, division engineer in charge of the sewage disposal investigations being conducted at Chicago; Professor George C. Whipple, consulting engineer of New York, and Professor of Sanitary Engineering at Harvard University; Mr. W. L. Stevenson, assistant engineer in charge of the sewage disposal investigations being conducted and the works now in operation at Philadelphia. The committee is not taking up the methods to be used in making the tests but rather as engineers are aiming to standardise what shall be done, leaving to the committees of the laboratory section of the American Public Health Association the technique of the tests.

PART I.—SEWAGE WORKS OPERATION.

The introduction of sewer systems into modern cities whereby the wastes of domestic life and industry are discharged into watercourses has brought about the need for the treatment of sewage in order to accomplish two purposes:

(*a*) To promote the comfort and convenience of the people by maintaining watercourses in a decently clean condition that is, free from nuisance to sight or smell, so as to be fit for civic development, industry and recreation.

(*b*) To aid in protecting the public health when necessary by maintaining watercourses as fit sources of water supply after adequate purification, or for the cultivation of shell-fish.

The initiative for installation of sewage treatment works usually is either

(*a*) The recognition by a community of the fact that nuisances in watercourses retard municipal developments, deprive the citizens of their use of the streams, and offend common decency.

(*b*) An order from a properly empowered body for the installation as a sanitary measure for the protection of the users of the watercourses.

The design and extent of the works and the degree of treatment required should be such as to promote economy of funds in order to give the greatest benefit to the largest number of people at the least cost.

Based upon these premises, the operation of a sewage treatment works may be judged by the following standards:

(*a*) Prevention of nuisance either at the works or in the body of water receiving the effluent.

(*b*) Protection to the public health—*e.g.*, in reducing the pollution in a watercourse to relieve the load on a water purification plant.

In the following discussion it is assumed that, under the guidance of competent sanitary engineers, the specific problem has been studied, resulting in the design and construction of efficient sewage treatment works, and upon the completion the owner is confronted with the problem of its operation and maintenance.

One of the first and most important matters to be considered in the operation of a sewage treatment works is the heterogeneous nature of sewage. Its composition varies widely in different towns, influenced by the ways of living and amount and kind of industrial wastes. Some works receive a sewage so fresh that original fæcal matter, paper and fats are practically unchanged, while in others the solids have disintegrated and partly dissolved.

The hourly character and composition of the sewage may also vary from day to day, being uniform in one place and different in another. During storms the sewage collected by a combined system of sewers is increased in volume and its composition changed to a very marked degree.

Many of the forces of Nature are utilised in sewage treatment in an involved and complex manner. Gravitation is utilised in sedimentation and in the hydraulics of the flowing liquids; chemical reactions occur in the use of precipitants, in disinfection, and in the changing combinations of sewage materials; and biological forces are active in the digestion of sludge and in the oxidation of the dissolved organic matter.

In successful operation all of these factors must be controlled. It is therefore self-evident that sewage treatment works, particularly of any size, cannot be made automatic, but require constant observation and supervision by trained, skilled operators in order to accomplish the purpose for which the plant was installed and the funds invested.

The degree of technical skill required depends upon the following factors, but not necessarily in the order given:

(*a*) The magnitude and design of the works.

(*b*) The processes used.

(*c*) The composition of the sewage treated.

(*d*) The receiving body of water.

It does not always follow because a sewage treatment works receives a large volume of sewage that the responsibility is in proportion to the magnitude, because the processes used may be simple and the dilution of the effluent large. Some small works, for particular purposes (*e.g.*, fat recovery) may require very expert supervision.

The use of biological works for oxidation or the use of disinfection always requires more attention than simple sedimentation. Emscher tanks which include sedimentation and sludge digestion in a single device require a higher degree of skill to operate than plain sedimentation tanks. The presence of considerable volumes of trade wastes in sewage usually introduces difficulties not encountered with ordinary domestic sewage.

Constant attendance upon a sewage plant for a private estate or small institution is unnecessary. Such plants should be simply designed, so that an employee with other duties is required to give but a small part of his time to the care of the plant. But in such cases successful results are not always obtained unless the designing engineer or some competent person is called in at regular times to inspect and advise concerning the technical details of operation. Such inspections are particularly important during the early life of the plant to train the attendant to observe and interpret the conditions which require attention.

For the larger institutional plants and works for small towns more skilled attendants are required, and the need for competent supervision is more urgent.

In municipal sewage treatment works of any magnitude the constant services of a scientifically trained man in charge is practically essential to success. The larger volumes of sewage treated afford greater potentialities for the creation of nuisance from bad odours if the works are not constantly kept in the best condition. The effect upon the receiving body of water is also greater, and a deterioration in the quality of the final effluent may allow the development of conditions such as nuisance in the watercourse, or danger to water supplies, which it is the very function of the works to prevent. And, finally, it is economical to pay a liberal salary to the right kind of man to keep the annual charges for operation and maintenance at a minimum figure by business-like management.

The keeping of careful, thorough and neat records of operation is essential to efficient operation. State authorities charged with supervision over the condition of the watercourses should require a uniform record. Such records, from the operating point of view, show the effect of changing methods of operation, and enable the selection of the most efficient and economical procedure. Complaints of citizens can frequently be answered and explained away by

[illegible] and often skilled [illegible] have previously [illegible]

A[illegible] example of the [illegible] of [illegible] [illegible] applied to [illegible] [illegible] A [illegible] [illegible] works required to provide the [illegible] of [illegible] in a chemical laboratory [illegible] of water supply. [illegible] [illegible] [illegible]

should, however, be considered in connection with either the results of the tests designated X or relative stability, for the presence in the sample of sufficient decomposable matter might exhaust in a short time the dissolved oxygen found by the analysis.

Relative Stability: Methylene Blue.—This test has a definite value in connection with the dissolved oxygen and nitrate tests in explaining the records of past operation, but its greatest value is as a control for small works. Obviously, many small works cannot be kept under the continual observation of a trained chemist or engineer, and in such cases the relative stability test can be readily made by an attendant incapable of the more elaborate procedures. Under these conditions relative stability is of primary importance, and its daily use is strongly recommended in preference to occasional tests of other kinds.

Caution should be used in regard to the relative stability of tank effluents, sterile effluents or effluents containing certain industrial wastes.

Tests of Sludge.—(*a*) Specific gravity, (*b*) percentage moisture, (*c*) percentage of the dry residue that is volatile, (*d*) reaction—alkalinity or acidity.

These tests made on sludge, especially from two-story tanks and separate sludge-digestion tanks, are of great value in operation, as they interpret the biological digestion of the organic matter. The reaction test is particularly important as an aid in detecting the cause and pointing out the remedy for poor sludge production. It has been found that tanks producing bad sludge can be made to produce good sludge by adjusting the reaction from acid to alkaline.

In sludge obtained from fine screening it is advisable to determine the weight per unit volume and percentage moisture.

Bacteria: Presumptive Tests for B. Coli.—For sewage treatment works intended solely to prevent nuisance in watercourses, tests for bacteria are superfluous.

They are, however, of the utmost importance in cases where the works are intended to protect sources of water supplies or shellfish layings.

It is unnecessary to carry on the confirmatory tests

TESTS FOR DETERMINING THE COMPOSITION OF CRUDE SEWAGE FOR COMPARISON.

Occasional composite samples to be analysed for nitrogen as organic and as free ammonia, at same time samples to be examined for avidity for oxygen test called X in report.

* In small plants not provided with a laboratory relative stability may take first place.

The formation of gas or the red colonies having appearance of *B. coli* on Litmus Lactose Agar at 37 deg. are both in successful use for this purpose.

When used, the test should primarily be made on the receiving body of water, and secondarily on the effluents from disinfection processes.

TESTS OF CRUDE SEWAGE FOR COMPARISON.

For the purpose of record and comparison also it is advisable to make at intervals tests upon composite samples of the crude sewage received at the works. These tests should indicate the character, condition and strength of the sewage.

It is recommended that at least the following determinations be made

(1) Test for suspended matter, called Y above.
(2) Test for avidity for oxygen, called X above.
(3) Nitrogen as organic.
(4) Nitrogen as free ammonia.
(5) Chlorine.

Special cases may require other tests to show the characteristics of the sewage.

Particular attention is called to the notes on Test X dissolved oxygen and bacteria in connection with the receiving body of water. Tests, when applied to sewage and effluents are of value as tools for operating control, but as a measure of sufficiency of treatment they do not always supply adequate information. This is on account of the difficulty of establishing precise standards for effluents discharged into different kind of receiving bodies of water and therefore the final criterion of sufficiency of treatment usually rest in the effects produced upon the receiving body of water considered in the light of expediency and local needs. Investigations of the effects of effluents on bodies of water are therefore urgently recommended.

For the different purposes of operating control, determination of efficiency and determining sufficiency of treatment, the tests commented upon above are grouped in a diagrammatic table submitted herewith.

CONCLUSION.

The committee wish to express their thanks and appreciation to Mr. F. E. Daniels for valuable services rendered in the preparation of this report.

One of the functions of this committee is co-operation with the laboratory section. It is therefore recommended that the proper committee of that section take up for consideration the improvement of the test for suspended matter in sewage called Y in this report, and that during the coming year analysts direct their attention to the simplification and standardisation of the test for avidity for oxygen, called X in this report.

OXFORD CITY ENGINEER'S DEPARTMENT.

The question of the reorganisation of the engineering department of the Oxford Corporation and the construction and maintenance of the roads has been before two meetings of the General Purposes Committee within the last few days. As a result of their deliberations, a report presented by the Staffs Committee was the *Oxford Chronicle* states adopted. The proposed, in the first place, that the whole control of the engineering department, including the construction and maintenance of the roads, should be placed in the hands of one person, to be called the city engineer. It was further proposed that, having regard to the onerous character of the work in contemplation, the interests of the city would best be met by the appointment of a new city engineer, but in order that the corporation might profit by Mr. White's long experience and valuable advice, and also as a mark of appreciation of the great service he has rendered to the city during the last forty-four years, that he should be appointed consulting engineer at a salary of £500.

The committee also recommended that the street cleansing and watering and removal of house refuse be transferred from the sanitary department to the department of the city engineer, and that the salary of the newly appointed city engineer be fixed at £600 per annum, rising to £800. The report, which was discussed at considerable length, was considered at a special meeting of the city council.

The amendment by which the report was defeated at the council meeting virtually proposed that no change should be made in the highways management, but that the Road Board should be consulted with the view to adopting improvements in road making and maintenance. It was also understood though this was not embodied in the amendment—that a new road foreman should be appointed.

By-laws.—Mr. Roden Dixon, borough surveyor of Stratford-upon-Avon, would be glad to hear from surveyors of towns where by-laws with respect to new streets, drainage, buildings, &c., have been approved by the Local Government Board during the past few years.

CORRESPONDENCE.

PURIFICATION OF DAIRY WASTES.

To the Editor of THE SURVEYOR.

SIR,—With respect to your leader "Purification of Dairy Wastes," I have perhaps not made it quite clear that the reduction in volume of wastes from dairies should be effected *before* tank treatment. [illegible] to dilute the tank liquor with a proportion of the clean waters before filtration.

As regards precipitation, a large proportion of the polluting substances occurring in dairy wastes are in solution, and certain precipitants throw down an appreciable portion of the soluble solids, thereby effecting a material reduction in the strength of the liquid to be filtered, and *then* is the time to dilute, if necessary.

It must be borne in mind that the total annual volume of waste turned out from a dairy is not large; further, that many dairies do not work all the year round, so that the cost of precipitants is not heavy, as would be the case in dealing with sewage. Thus, a dairy turning out daily some 6,000 gallons of waste will produce, at the very outside, some 2,000,000 gallons yearly, and a dose of about 16 grains of precipitant per gallon is equivalent to 1 ton of precipitant.

The provision of a percolating filter 12 ft. deep, served by gravitation, might present difficulties in this country, especially as creamery sites are usually selected at or near to important cross roads; but with most creameries there is a great deal of waste heat, which could usefully be employed in pumping the waste liquors. In Ireland and Scotland there is often ample available fall. Difficulty in the matter of storage can be obviated by gravitating or pumping direct to quiescent tanks provided with draw-off [illegible]

[illegible] 2,000 parts per 100,000 of dissolved oxygen in five days requires as long a duration of contact with the filtering material as can be obtained, and by the use of precipitants a finer grade of filtering medium can be employed, and hence enhanced duration of [illegible]

I trust some useful discussions may result from the article.—Yours, &c.,

G. BERTRAM KERSHAW, M.A.M.Inst.C.E., M.Inst.W.E.

9 Victoria-street,
Westminster, S.W.
December 28, 1914.

CHISWICK TRAFFIC CENSUS.

To the Editor of THE SURVEYOR.

SIR,—I see you are interested in the report of the traffic census of the Great Western Road in your issue of November 6th, and I would esteem it a great favour if you would let me know, either by letter or by publication in THE SURVEYOR, what is the width of the street or highway on which this traffic census was taken, as I believe many other road engineers would also like to have this question answered.

In our traffic census we are reducing the traffic to foot-tons, and I would like to reduce the traffic on your Great Western Road to the same unit. Our assumed average weights are practically the same as you used in the Chiswick census.—Yours, &c.,

F. H. JOYNER,
Road Commissioner.

Road Department,
Los Angeles,
California.
December 7, 1914.

[We have submitted the above to Mr. Edward Willis, the engineer and surveyor to the Chiswick Urban District Council, by whom the traffic census referred to by our correspondent was prepared, and have been favoured with the subjoined reply.—ED.]

SIR,—I have to thank you for your communication of the 22nd instant enclosing a letter from the Chief Road Commissioner of Los Angeles, which I herewith return.

It is rather interesting and complimentary to know that your periodical has such a wide circulation, and

is also found so useful at the other extremity of the globe.

I have much pleasure in giving you the following information: Width of carriageway where census was taken, 40 ft. 11 in.; maximum width, 49 ft. 2 in.; minimum width, 30 ft. 10 in.; tramway width (largely excluded from the other traffic), 16 ft.—Yours, &c.,

E. Willis.
Town Hall, Engineer.
Chiswick.
December 23, 1914.

SEWAGE TREATMENT BY AERATION.

To the Editor of The Surveyor.

Sir,—With regard to the above, how is this process going to be affected by the passage of storm water and sewage through the tanks up to, say, three times the average dry-weather flow? Dr. Fowler has rightly said that the conditioning factor (or words to that effect) is cost. I have recently had a letter from an eminent New York engineer, in which he says: "The borough of Brooklyn has been carrying on experiments for several months under Geo. P. Hammond, and, I believe, have found in general that to produce a good effluent this—*i.e.*, aeration—has to be kept up about two hours (agreeing with Fowler), and that this would cost as much in practice as probably to throw it out of the race with other methods. Perhaps some more efficient method will be found some time, cheapening the process."—Yours, &c.,

G. Bertram Kershaw, m.am.soc.c.e., &c.
9 Victoria-street,
Westminster, S.W.
December 28, 1914.

CHARGING FOR WATER SUPPLY.

To the Editor of The Surveyor.

Sir,—Under "Things One Would Like to Know," in your issue of December 25th, the contributor of those most readable notes asks if it is not "rather a bogey to assume that, if water were supplied by meter, an insufficient quantity for sanitary purposes would be used." It is a bogey, and it could easily be disposed of by supplying free a minimum quantity sufficient for sanitary needs, and charging, per meter, for all used beyond that quantity. The illogical absurdity of basing the charge upon rateable value is shown by the assessments imposed in the City of London, where costly office properties use far less water than is used in a small middle-class villa with a bath and a garden.—Yours, &c.,

A Victim.

December 26, 1914.

A Glossary of Road Terms (By H. Percy Boulnois, m.inst.c.e., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

Motor-cycle Allowances.—The question of an allowance for a motor cycle for the surveyor to the Pewsey (Wilts) Rural District Council was discussed at a recent meeting. The surveyor wrote thanking the council for their consideration of his application, but pointed out that he could not provide and run a motor cycle upon £25. Mr. Jeans expressed the opinion that it was absolutely necessary for the surveyor, if he was to exercise an effective supervision of the roads in the outlying parts of the district, to have a motor bicycle. The money, he said, would be well spent. He would move that the surveyor be allowed £35 a year, so that he might provide himself with a motor bicycle, and pay all expenses attaching thereto. Mr. May supported. He was sure, he said, it would be to the advantage of the council. They had 125 miles of road in the district, and it was obvious that the surveyor could not give adequate supervision to that area if he had to get about the district on an ordinary bicycle. They were paying their surveyor a miserable salary; any ordinary clerk could get £90 a year, and by adding £30 a year for a motor bicycle they would then only be paying £120 a year. Eventually the amended proposition to vote £35 was agreed to.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why is it that in nearly all cases municipal surveyors receive very inadequate remuneration for the services they render their country? Is it because there is no scale by which members of councils can decide what would be a reasonable remuneration to pay their surveyor, having regard to the size of the town or community? How would a suggestion that a salary of £20 per annum for every 1,000 inhabitants work out? And would this suggested scale fairly meet all cases? Will some of the readers of The Surveyor discuss this question?

* * * *

Is not the value of the estate of the late Mr. A. J. Valentine, a civil engineer, a melancholy example of how little grist comes to the millers of this profession? It appears from the daily Press that this gentleman wrote his will in red ink on the back of a cigarette card, and that the total amount of his estate was only £89. How many civil engineers are there who could compete with the deceased gentleman in the small compass of their wills, the lurid colour of the writing, and the amount of the legacy?

* * * *

Is not the Institution of Water Engineers to be congratulated on their generosity in presenting fifty guineas to the Prince of Wales' Fund, twenty guineas to the funds of the Red Cross Society, and thirty guineas to the Belgian Relief Fund? Is it not a pity that the lack of funds or other reasons prevent other institutions and societies from following this excellent example?

* * * *

How many sewage works managers have been troubled with dairy wastes in this country? Is it not notorious that where there is an excess of such wastes in the sewage there is considerable difficulty in obtaining even a "passable" effluent? Will not Mr. Kershaw's series of articles on the purification of dairy and other wastes, which commenced in last week's issue of The Surveyor, prove of considerable assistance both to engineers and to managers in dealing with the problems that present themselves?

* * * *

Is it not rather plucky of the Scarborough Town Council, and an indication of the British character, that, notwithstanding the recent wanton bombardment of the town by the Germans and the damage then caused, they are proposing to erect some bungalows and a shelter in the South Cliff Gardens at a cost of £1,260? Is this not quite the right spirit, whatever reverses we may suffer?

* * * *

Apropos of this spirit, how many people have read in the *Times* of the 26th ult. an account of the splendid sermon preached by the Rev. W. McCarthy, of St. Peter's, Great Yarmouth, with reference to the recent coast raids, in which he says, *inter alia*, "No patriot will hesitate to admit that the destruction of the towns on the East Coast would be a small price to pay for the safety of England and the Empire"? And is not the following also very true: "We have said much in the past about the heroism of those who have been killed in the trenches, but if it has been anything more than talk we shall now nerve ourselves to face possible loss of life, and to have our own names inscribed on the roll of honour"? Would it not be well if all parsons were imbued with this fine spirit at the present juncture?

* * * *

Is it a fact that at a recent meeting of the Merton Urban District Council it was reported that Mr. P. M. May, the accountant, who had been admitted a member of the Officers' Training Corps, had withdrawn from it in consequence of an informal expression of opinion by certain members of a committee? And is it true that as a sequel the council considered the matter, and came to the decision *not* to permit heads of departments to join any branch of H.M. Forces "in view of the importance of local government work"? Would not one have thought that the strengthening of our fighting forces, on which the very life of the nation depends, was also of some importance? How would a German bomb, dropped on the council offices one day, affect these councillors' views?

The Provision of a Municipal Water Service.*

By LEWIS MITCHELL, M.I.M.C.E., M.I.C.E., Waterworks Engineer, Bolton.

(Conclusion.)

The calamity due to bursting of [illegible] recently [illegible] being [illegible] by the failure of the Dale Dyke reservoir, belonging to the Sheffield Corporation, by which over 800 lives were lost, and the engineers were indicted for damages exceeding £500,000. [illegible] America, where [illegible] been more frequent, and the failure of reservoir banks [illegible] the Williamsburg, the Johnstown dam and the Austin dam show to what disastrous consequences a neglect of proper precautions as to the foundations and puddle trenches or provision as to floods may lead. And yet so little is the possibility of disaster by the bursting of a reservoir appreciated that in the Model Water Bill, which is framed for the case of a local authority being the undertakers, no section is provided dealing with damage which may be caused thereby, although it is usual to include in Acts authorising the construction of waterworks a special clause for the protection of millowners and landowners making the undertakers responsible for damage caused by the bursting of the reservoirs or aqueducts. There are, however, very notable exceptions, such as the Liverpool Corporation Waterworks Act, 1880, authorising the Vyrnwy scheme, in which no bursting clause occurs, and in the Bury Corporation Waterworks Act, 1888, the [illegible] on account of the proviso at the end thereof—viz., "provided that no obligation or liability shall attach to the corporation in respect of an injury occasioned by [illegible] corporation or any defect in the works."

From the reservoir or other source of supply the water is conducted by a conduit such as a tunnel or [illegible] under pressure [illegible] by the other. It may be delivered into a service reservoir, and from thence distributed to the town, as in the case of Manchester and Glasgow, or delivered direct to the district of supply without the intervention of a service reservoir, as is usual in comparatively small undertakings, or is conveyed to filters and after purification [illegible] as in the case of Bolton.

There can be little question as to the desirability of filtering water before it is finally delivered to the consumer. While the action of prolonged storage in reservoirs is undoubtedly beneficial, inasmuch as by sedimentation the suspended matters, living and dead, subside, and the risk from pathogenic organisms, which may have been originally present, is greatly diminished, it is in most cases difficult, if not impossible, to ensure that the water has been stored sufficiently long to render it safe. The effect produced by the Lake of Geneva on the waters of the Rhone which pass through it, and of Loch Katrine on the water supplied to Glasgow, and by other large expanses of fresh water, are familiar instances of the purification of waters in a natural way; but in relatively small reservoirs, such as those of the Bolton Corporation, solid matter in a minute state of subdivision may, especially under certain conditions of the reservoir, pass through the outlet valves within a few hours of its entrance, and the clarifying effect of such storage is far from being adequate. If the water drawn from any of our local reservoirs were sent for only a few hours into the town without filtration there would be an immediate outcry. Anyone who has seen samples of unfiltered and filtered water side by side will readily admit the desirability of filtration, if only because of the greatly improved appearance of the filtered water, apart from any question of increased bacterial purity.

There are two kinds of filters—viz., slow sand and pressure or mechanical—and both kinds are to be seen in Bolton. A sand filter consists essentially of a watertight basin or tank containing a layer of fine sand from 2 ft. to 3 ft. thick, supported by a layer of gravel or broken stones in graduated sizes from 6 in. to 12 in. in depth and underdrained, an arrangement being provided for delivering the raw or untreated water above the level of the surface of the sand, and for drawing it off after it has been purified by passing downwards through the filtering medium. Such a filter will efficiently deal with 2,000,000 gallons per [illegible] but it is nevertheless true, that the dirtier a filter is on the surface the greater is the degree of purification which it effects; immediately after being cleaned the chemical and bacterial efficiency is lowest, and if the rate of filtration be regular and continuous, as it [illegible] increase until it becomes altogether inoperative. The explanation is that the action of filtration is almost entirely biological, and the results obtained are not effected by the sand, but by the thin, slimy, gelatinous film or coating composed of finely divided clay or mud (in which is entangled a mass of algæ and bacteria and diatoms), which forms on the surface and around the grains of sand, constituting a cultivation [illegible] mechanically retained under conditions which are not favourable to their existence. A germ is so infinitesimally small that the finest sand could offer no resistance to its passage with the water. The average "life" (or period of working continuously) of each of the sand filters of the Bolton Corporation is only twenty-four days, on account of the large amount of suspended matter which the waters contain; the average working period for similar filters throughout this country is six weeks, and in some instances as long as five months. The best sand filters will remove, on an average, 99 per cent of the bacteria present in the raw water. The cost of filtration by this system depends upon a number of circumstances, such as the extent of the filters and the condition of the water to be dealt with, but in the case of those belonging to the Bolton Corporation it is, including for repaying capital charges in sixty years, and for repairs and maintenance, 0·74d. per 1,000 gallons.

About twenty years ago pressure or mechanical filters were introduced into this country from America, where they were first used in connection with paper mills to remove from water the grosser particles of matter in suspension which, if not removed, would prejudicially affect the texture and appearance of the paper manufactured. They are now, however, extensively in operation for treating municipal supplies. The usual type of pressure filter consists for the most part of a closed steel cylinder about 8 ft. diameter, with top and bottom convex and concave shaped respectively; it is partly filled with sand or quartz, which rests on a perforated plate, underneath which is a collecting chamber. The raw water, on entering at the top, passes down through the sand into the chamber, and thence into the mains. In order to produce artificially the gelatinous film on the surface of the sand, which, as already explained in the case of slow sand filters, is so essential to efficient purification, a small quantity of sulphate of alumina is introduced to the water before it enters the filter, and this, combining with the carbonate of lime already present, or added also, forms a flocculent, inorganic deposit of insoluble alumina hydrate. The filter is cleaned by reversing the flow of water, the sand being at the same time agitated by revolving arms or a turbine propeller and jets of water, and as a rule this operation requires to be done once a day. The rate of filtration ranges from [illegible] to [illegible] gallons per acre daily, or at least fifty times that of a slow sand filter. In point of efficiency the results obtained from pressure filters are practically identical with those from the best sand filters. The initial and working costs are less; no service reservoir is necessary as an adjunct, as in the case of sand filters; they require little space; and being under pressure there is no appreciable loss of head in working them, while they may be placed at any convenient point between the storage reservoir or source of supply and the point of distribution. The cost of filtration by this method in the two installations in Bolton is 0·59d. per 1,000 gallons (which includes for repaying capital charges in thirty years, repairs and maintenance),

*Lecture delivered recently at Bolton.

and the average cost for both systems is 0·6762d. per 1,000 gallons filtered.

DISTRIBUTION.

From the sand filters the water is delivered into covered service tanks, from which light is excluded to prevent the growth of algæ and infusoria, and from thence, and also direct from the pressure filters, it is conveyed by distributing mains to all parts of the town and district of supply, and delivered to the consumers under a practically constant pressure. There is no need to interpose between the tap and the consumer that snare and delusion the domestic patent filter, in the properties of which some persons, innocently perhaps, place implicit confidence. The spongy iron, animal charcoal, porous stone, coke, and various preparations of iron which those filters contain are liable to become breeding grounds for all kinds of bacteria, and receptacles of filth. They are not only quite unnecessary, but mischievous, and it is the duty of a municipal authority to supply water of a quality not merely fit for consumption, but pure and wholesome, without putting consumers to the expense and trouble of household filtration. The Waterworks Clauses Act defines a constant supply as one "constantly laid on at such a pressure as will make the water reach the top storey of the highest houses within the limits" of the special Act, and although the Bolton Corporation is not under obligation to deliver water to any house except by gravitation, not only is the pressure in our mains constant, within certain limits of fluctuation due to irregular draught upon them, but every house in the town has an ample supply provided at a sufficient pressure, which is also adequate for fire-extinguishing purposes. In this respect great improvement has been made within recent years, and many millowners who pay large amounts for fire insurance protection have reason to appreciate the increase of pressure by which considerable saving in premiums for such has thereby been effected.

Owing to the configuration and range of levels in a town or district of supply it is frequently necessary, in order to ensure that the pressure shall not be excessive in the lower parts, nor insufficient in the higher portions, to divide it into sections or zones of level. Thus the difference in level within the limits of the Bolton Corporation's water area (excluding Belmont village, supplied from Daddy Meadows Springs, and Edgworth district, supplied from Crowthorne reservoir) is 500 ft., and the district is divided into two zones, the upper zone being dependent upon the Spring reservoir, and the lower zone upon the Entwistle and Dingle reservoirs. In the higher reaches of a town the inequalities of pressure arising from the heavy demands upon the mains during certain parts of the day are sometimes met by the provision of a high-level tank or tower, which automatically fills up during the night when the pressure is greatest, and pays out during the day when the demand is greatest. An example of this is seen in the tank at Top o' th' Cow, Bolton, and the famous Norton Tower, Liverpool.

The water supplied for strictly domestic purposes is charged for by a rate or rent levied upon the nett annual value or upon the gross annual value, upon the poor rate assessment, upon the rack rent, or upon the full rent. What is to be included within the description "domestic purposes" and what by "trade purposes" is sometimes difficult to determine, as witness the recent cases of the *Metropolitan Water Board* v. *Avery* and *Others* v. *Metropolitan Water Board*. In the latter action, which came before the High Court on October 14th and 16th last, Mr. Justice Sargeant held that the true test is not the character of the user, but the character of the premises; and that it matters not whether the whole of the water consumed is for purposes "domestic" within the Avery decision, if any part of the premises is used for the purpose of any trade or business. The Waterworks Clauses Act, 1863 (sec. 12), provides that domestic supply "shall not include a supply of water for cattle, or for horses, or for washing carriages, where such horses or carriages are kept for sale or hire, or by a common carrier, or a supply for trade, manufacture or business, or for watering gardens, or for fountains, or for any ornamental purpose"; but a definition of what is held to be included in a "domestic supply" is to be found in the Special Act of every waterworks authority, and by any user of water that is not strictly "domestic" as defined by such Act, the authority may make any demand they choose.

While water authorities are under legal obligation to supply water for domestic purposes, they are not bound to supply water for other purposes, such as for trade and for manufacturing, and such supplies are given under an agreement, a charge being made for each 1,000 gallons so given and measured by meter.

It is frequently urged that water supplies should be given not only for trade, but for domestic and all purposes, by measurement, so as to avoid inequality of treatment and as a check upon waste and misuse. It must be admitted there is a great amount of water wasted in every town due to badly designed appliances, defective workmanship, the employment of inferior material, resulting in leaking pipes, which, being out of sight, are out of mind, and by carelessness, as shown by leaving taps open, a mere dribble from which continued for a year represents in money value the water rent of an artisan cottage; but there are numerous objections to this proposal, the chief of which is that it would tend to restrict the legitimate and necessary use of water and discourage habits of cleanliness, and any arrangement which would discourage the application of water to useful purposes is an obstacle to social progress, and must therefore not be tolerated. A further serious objection to the introduction of the house meter system is the amount of capital involved, which, in a town like Bolton, would not be less than £100,000, and in addition there would also be the cost of inspection and repairs of such meters, or a total expenditure which would not fall short of an average annual water rate.

In these remarks I have tried, from an engineering point of view, to accomplish the task given me by showing what is involved in the provision of a municipal water service. Perhaps they will help us to realise more clearly than hitherto to what extent we are dependent upon the domestic tap. We turn it and the water flows; it is such a common operation that we expect it as a matter of course. And yet what engineering difficulties have had to be surmounted, what miles of culverts and pipes laid, or moorland and fell searched, of the huge reservoirs designed to receive the precious liquid, in order that we may so easily obtain an abundant supply of water in our houses. It is all so simple to the superficial observer, yet withal wonderful and grand.

SOME RECENT PUBLICATIONS.*

HAZELL'S ANNUAL, 1915. Price 3s. 6d. nett. London: Hazell, Watson & Viney.

The 1915 edition of "Hazell's Annual" (now in its thirtieth year of issue) makes another remarkable stride forward as the most comprehensive of existing works of reference. To summarise the additional features which have been added to the present issue would in itself make a serious demand upon our space. Some idea, however, of the extraordinary extent and variety of the information compressed into this wonderful book may be conveyed when we state that its index (easily the most efficient index in any annual work of reference) now contains close upon 20,000 entries. In spite of the demand made on its space by the war "Hazell's" remains true to its reputation as a faithful recorder of all the "movements of the time." Features we may note as considerably enlarged are the lists of the personnel of Government departments and of public bodies; the pages devoted to banking, railways, shipping and insurance; the newspapers of the United Kingdom and Colonies; and the sections on engineering and science. Finally, we must give a word of praise to the excellent tables on the Income Tax, which will enable income tax payers to see at a glance what their obligations will be during 1914-15 and 1915-16. It is not too much to say that "Hazell's Annual" has, with its thirtieth issue, entered on an entirely new career of usefulness as an indispensable work of reference.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books

Institution of Water Engineers.

WINTER GENERAL MEETING IN LONDON.—(2.)

[illegible]

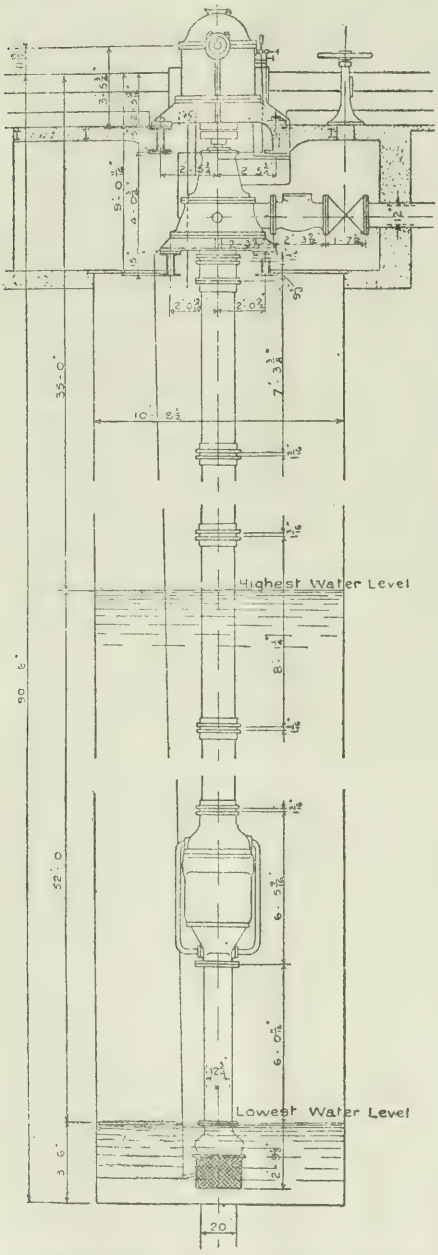
THE WHITTON PUMPING STATION, IPSWICH CORPORATION WATERWORKS.

By CHARLES W. S. OLDHAM,
Borough Water Engineer.

[illegible]

The supply was originally obtained from wells sunk in the chalk at Bramford, giving at the time a supply of 500,000 gallons per day. Between the sanctioning of the undertaking and the completion of the works the population increased from 30,000 to 50,000, and the consumption rose to 1,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 70,000, and the consumption to 2,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 90,000, and the consumption to 3,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 110,000, and the consumption to 4,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 130,000, and the consumption to 5,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 150,000, and the consumption to 6,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 170,000, and the consumption to 7,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 190,000, and the consumption to 8,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 210,000, and the consumption to 9,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 230,000, and the consumption to 10,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 250,000, and the consumption to 11,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 270,000, and the consumption to 12,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 290,000, and the consumption to 13,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 310,000, and the consumption to 14,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 330,000, and the consumption to 15,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 350,000, and the consumption to 16,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 370,000, and the consumption to 17,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 390,000, and the consumption to 18,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 410,000, and the consumption to 19,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 430,000, and the consumption to 20,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 450,000, and the consumption to 21,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 470,000, and the consumption to 22,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 490,000, and the consumption to 23,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 510,000, and the consumption to 24,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 530,000, and the consumption to 25,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 550,000, and the consumption to 26,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 570,000, and the consumption to 27,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 590,000, and the consumption to 28,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 610,000, and the consumption to 29,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 630,000, and the consumption to 30,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 650,000, and the consumption to 31,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 670,000, and the consumption to 32,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 690,000, and the consumption to 33,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 710,000, and the consumption to 34,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 730,000, and the consumption to 35,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 750,000, and the consumption to 36,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 770,000, and the consumption to 37,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 790,000, and the consumption to 38,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 810,000, and the consumption to 39,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 830,000, and the consumption to 40,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 850,000, and the consumption to 41,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 870,000, and the consumption to 42,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 890,000, and the consumption to 43,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 910,000, and the consumption to 44,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 930,000, and the consumption to 45,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 950,000, and the consumption to 46,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 970,000, and the consumption to 47,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 990,000, and the consumption to 48,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,010,000, and the consumption to 49,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,030,000, and the consumption to 50,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,050,000, and the consumption to 51,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,070,000, and the consumption to 52,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,090,000, and the consumption to 53,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,110,000, and the consumption to 54,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,130,000, and the consumption to 55,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,150,000, and the consumption to 56,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,170,000, and the consumption to 57,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,190,000, and the consumption to 58,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,210,000, and the consumption to 59,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,230,000, and the consumption to 60,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,250,000, and the consumption to 61,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,270,000, and the consumption to 62,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,290,000, and the consumption to 63,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,310,000, and the consumption to 64,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,330,000, and the consumption to 65,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,350,000, and the consumption to 66,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,370,000, and the consumption to 67,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,390,000, and the consumption to 68,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,410,000, and the consumption to 69,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,430,000, and the consumption to 70,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,450,000, and the consumption to 71,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,470,000, and the consumption to 72,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,490,000, and the consumption to 73,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,510,000, and the consumption to 74,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,530,000, and the consumption to 75,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,550,000, and the consumption to 76,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,570,000, and the consumption to 77,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,590,000, and the consumption to 78,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,610,000, and the consumption to 79,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,630,000, and the consumption to 80,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,650,000, and the consumption to 81,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,670,000, and the consumption to 82,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,690,000, and the consumption to 83,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,710,000, and the consumption to 84,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,730,000, and the consumption to 85,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,750,000, and the consumption to 86,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,770,000, and the consumption to 87,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,790,000, and the consumption to 88,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,810,000, and the consumption to 89,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,830,000, and the consumption to 90,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,850,000, and the consumption to 91,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,870,000, and the consumption to 92,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,890,000, and the consumption to 93,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,910,000, and the consumption to 94,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,930,000, and the consumption to 95,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,950,000, and the consumption to 96,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,970,000, and the consumption to 97,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 1,990,000, and the consumption to 98,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,010,000, and the consumption to 99,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,030,000, and the consumption to 100,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,050,000, and the consumption to 101,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,070,000, and the consumption to 102,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,090,000, and the consumption to 103,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,110,000, and the consumption to 104,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,130,000, and the consumption to 105,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,150,000, and the consumption to 106,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,170,000, and the consumption to 107,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,190,000, and the consumption to 108,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,210,000, and the consumption to 109,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,230,000, and the consumption to 110,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,250,000, and the consumption to 111,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,270,000, and the consumption to 112,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,290,000, and the consumption to 113,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,310,000, and the consumption to 114,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,330,000, and the consumption to 115,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,350,000, and the consumption to 116,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,370,000, and the consumption to 117,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,390,000, and the consumption to 118,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,410,000, and the consumption to 119,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,430,000, and the consumption to 120,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,450,000, and the consumption to 121,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,470,000, and the consumption to 122,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,490,000, and the consumption to 123,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,510,000, and the consumption to 124,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,530,000, and the consumption to 125,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,550,000, and the consumption to 126,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,570,000, and the consumption to 127,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,590,000, and the consumption to 128,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,610,000, and the consumption to 129,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,630,000, and the consumption to 130,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,650,000, and the consumption to 131,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,670,000, and the consumption to 132,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,690,000, and the consumption to 133,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,710,000, and the consumption to 134,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,730,000, and the consumption to 135,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,750,000, and the consumption to 136,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,770,000, and the consumption to 137,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,790,000, and the consumption to 138,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,810,000, and the consumption to 139,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,830,000, and the consumption to 140,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,850,000, and the consumption to 141,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,870,000, and the consumption to 142,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,890,000, and the consumption to 143,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,910,000, and the consumption to 144,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,930,000, and the consumption to 145,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,950,000, and the consumption to 146,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,970,000, and the consumption to 147,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 2,990,000, and the consumption to 148,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,010,000, and the consumption to 149,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,030,000, and the consumption to 150,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,050,000, and the consumption to 151,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,070,000, and the consumption to 152,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,090,000, and the consumption to 153,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,110,000, and the consumption to 154,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,130,000, and the consumption to 155,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,150,000, and the consumption to 156,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,170,000, and the consumption to 157,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,190,000, and the consumption to 158,000,000 gallons per day. The supply was augmented by the sinking of wells at Bramford, Sproughton, and Rushmere, and by the construction of a reservoir at Rushmere, with a capacity of 1,000,000 gallons. The population increased to 3,210,000, and the consumption to 159,000,000 gallons per day. The supply was augmented

upper part of the shaft from rusting due to being alternately wet and dry. A non-return valve is fixed on the pumping main to prevent shock to the rising main and foot valve when stopping the plant. The lubrication of the gears and top thrust-bearing is an important feature of the design. The oil is contained in an oil well at the bottom of the casing,



Whitton Pumping Station: Section of Well showing Pump.

and is pumped by a screw device upwards through the thrust-bearing, and on to the gear wheels, whence it flows back to the oil well, where it is cooled by water coils before being again pumped up.

The main pump is a high-lift vertical centrifugal three-stage pump, capable of delivering 1,850 gallons per minute against a head of 164 ft., and 1,400 gallons per minute against a head of 216 ft., in both cases at a speed of 350 revolutions per minute of the engine shaft. The fuel consumption guaranteed was 784 lb., with a margin of 5 per cent—that is a maximum of 823 lb. of fuel for each 1,000,000 gallons pumped. Careful running trials showed that, owing to the water in the well not falling as low as anticipated by some 10 ft., the most economical speed at which to run the plant was about 330 revolutions per minute, and at this speed the results proved that 1,000,000 gallons could be pumped against an average head of 203 ft. with a fuel consumption of 655 lb. Further tests proved the pump capable of supplying water at considerably greater heads without speeding up the engine, the results being 1,250 gallons per minute against 226-ft. head, and 1,080 gallons per minute against 236-ft. head. It should be noted that on starting the plant the sluice valve on the delivery main is closed for a few minutes, the head on the pump being then 229 ft.

The plant is run by one man, who is not a fitter, and who has had no previous experience of Diesel engines, the only other employee at the pumping station being a youth engaged as cleaner and for general work in the grounds, &c.

Owing to the fact that the plant was of such a novel type, the corporation required very stringent guarantees from the makers. The engine and pump were guaranteed for two years, and the vertical shaft and gears for four years, this guarantee including a definite undertaking by the contractors to replace the gears should they prove unsatisfactory or defective in any way during the period of guarantee, with some other form of gear, and should experience show the form of gear then installed to be unsatisfactory, the same guarantee was to apply to any alternative gear.

Each week a skilled fitter is sent from another pumping station to overhaul and clean the valves, &c. This man also had had no previous experience with Diesel engines.

The water pumped is measured by means of a 12-in. Leeds Helix meter, with graphic recording apparatus, placed on the pumping main, and very careful periodical measurements of the water pumped compared with check measurements at a reservoir prove this meter to be very accurate and reliable. A water-level indicator with low-water alarm is fitted in the well, and has proved very satisfactory; it is of simple construction, has no floats or pulleys, but consists of a hollow tube suspended in the water with the bottom end sealed, and the depth of submergence of this tube is indicated on a dial through rack and pinion gear.

From the time the plant was put to work in February last up to the middle of October 150,000,000 gallons had been pumped, and the average quantity of fuel used to pump 1,000,000 gallons against a head of 203 ft. has been 645 lb. The average cost of crude oil being £3 13s. per ton delivered into storage tanks at the pumping station, the fuel cost per 1,000 gallons lifted 100 ft. works out at ·125d., or ⅛d. Including paraffin, which is used for a short period at each run, the total fuel cost averages ·136d. per 1,000 gallons lifted 100 ft.

The oil is stored in two second-hand Lancashire boilers, with the flues removed. The engine-house and driver's cottage are lighted by means of a "Willett" petrol air-gas plant.

The following are the costs of the various works carried out:—

Hire and purchase of land	£900
24-in. bore 301-ft. deep, lined 54 ft., together with 14 days' test pumping	649
10-ft. diameter well 90 ft. 6 in. deep cast-iron lined, 100 ft. heading 6 ft. by 4 ft. and test pumping	2,429
3,791 yds. of 18-in. cast-iron pumping main, pipes, and laying, complete with valves, way leave, &c.	5,749
12-in. Helix meter	150
Engine house and foundations, allowing for second set. Roads, fencing, &c.	2,361
Cottage	250
Engine, pump and 10-ton crane	2,530
Oil-cart, boiler for storage, &c.	155
Lighting plant, level indicator, telephone, &c.	110
Making good highways	272
Forming banks, clerk of works, &c. ...	340
Total ...	£15,895

Note.—The cost of the Act of Parliament, which included powers other than for the Water Department, was £1,620, repayable in five years.

The plant has, up to the present, worked exceedingly well, and no trouble has been experienced. The

The Surveyor

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the offices of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

STREET WIDENING: PART OF A HOUSE.—In *Beyfus and Others* v. *Westminster City Council* (Chancery Division, Mr. Justice Sargant, October 19th) the plaintiffs were the owners of a restaurant in Old Compton-street, which was let on lease for seven, fourteen, or twenty one years. The council, acting under the powers conferred by Michael Angelo Taylor's Act, 1817, served on the plaintiffs, and also on the lessee of the premises, a notice to treat in respect of the front portion of the property to the depth of about 4 ft., in order to carry out a scheme for the widening of the street. The plaintiffs objected to the council taking a portion of the premises, because they considered that this would destroy their identity and necessitate structural alterations to the rest of the building. The lessee, on the other hand, was unwilling that the council should take the whole of the premises, but he did not object to refacing if the part was taken. Mr. Justice Sargant granted an injunction restraining the council from proceeding under the notice to treat.

QUERIES AND REPLIES.

In order to avoid confusion queriste are requested to use distinctive words as noms de plume. *The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.*

ALTERATION OF AREA: COMPENSATION TO OFFICER: REDUCTION OF SALARY: PAYMENT OF COMPENSATION DEFERRED.—"Perplexed" writes: I enclose a copy of the submission and award (*Myself* v. *The Corporation of X*) for your consideration. As this is a matter of vital importance to surveyors and others whose districts may be annexed, I think it will interest you. Your opinion as to what the award really means would be appreciated.

From the documents accompanying the query it appears that a Provisional Order was made, and confirmed by an Act of 1911, whereby among other districts the A urban district was added to the borough of X, and the urban district council ceased to exist as from the appointed day. The Provisional Order applied sec. 118 (3) and sec. 120 of the Local Government Act, 1888, to all persons who at the commencement of the order held office as officers of the urban district council, and also provided that every officer who, by virtue of the order or of anything done in pursuance or in consequence thereof, should suffer direct pecuniary loss by abolition of office or by diminution or loss of fees or salary, and for whose compensation no other provision was made by any enactment for the time being in force and applicable to his case, should be entitled to have compensation paid to him by the corporation for that pecuniary loss, and that reduction of salary was a direct pecuniary loss. It was also provided that in determining compensation regard was to be had to the requirements of subsec. (3) of sec. 120 of the Act of 1888, and that the compensation was not to exceed the limit therein mentioned. "Perplexed" was an officer of the urban district council, his term of service having been a few months less than ten years, reckoning to the date of the appointed day. About five months before the appointed day the town clerk of X wrote to him that the corporation would not be able to take over his services on the extension of the city. Correspondence ensued, with the result that on the appointed day the officer entered the service of the corporation, but at a less salary than he had been receiving from the urban district council. Compensation was awarded him of an annual sum equal to the loss of salary, but the corporation deferred payment of such compensation (except as to about one-ninth of the amount) until the officer's employment by them should cease. Disputes arose between the corporation and the officer as to this, and all matters in difference were referred to arbitration. By his award the arbitrator found that the officer was not a transferred officer under the Acts. I presume this means that he did not become an officer of the corporation by virtue of sec. 118 (13) of the Local Government Act, 1888. It would appear therefore that the arbitrator came to the conclusion that the office was abolished by the corporation under sec. 119 (3) of that Act, and that the employment of the officer by the corporation was under a fresh engagement and not under the Act. The arbitrator also found that the corporation were entitled to defer payment of the annual compensation awarded to the officer (except as to the small fraction thereof already mentioned) until the determination of his employment by them. Under sec. 120 (6) of the Act of 1888 the corporation had power to fix the date at which the compensation was to commence, subject to appeal to the Treasury. Presumably the arbitrator was of opinion that the action of the corporation in deferring payment was justified by this section. The case appears to be a hard one for the officer, and contrary to the apparent intention of the Act of 1888, viz., that the compensation should be adequate to the loss.

BRIDGE OVER RAILWAY: ALTERATION.—"D." writes: Within an urban district there is a highway passing over a railway by means of a bridge constructed by the railway company at the time the railway was made. The company pay an annual sum for the maintenance of the road on the bridge. The urban council now wish to construct a footway over the bridge, but to do so will diminish the present height of the parapet wall above the surface of the road by about 6 in., and the width of the carriageway by 4 ft. (1) Can the urban council construct this footway under sec. 147 of the Public Health Act, 1875, without the consent of the railway company? (2) If the footway is constructed, would the council have to raise the parapet wall?

(1) This section gives the council power to agree with the railway company to adopt the bridge as part of the streets or roads repairable by the public, and upon such an agreement being entered into the company's liability to maintain the bridge would cease, and the council could, presumably, construct the footway. (2) Under sec. 50 of the Railway Clauses Consolidation Act, 1845, the fence on each side of the bridge must be of a minimum height of 4 ft., and, I think, if the council adopt the bridge they would be bound to maintain the fences at that height.

CONTRACT WITH DISTRICT COUNCIL: SUBSEQUENT ELECTION OF CONTRACTOR AS COUNCILLOR.—"A. B." writes: A person contracted with a district council for the supply of broken stones for the repair of the highways from his own quarry early last year for twelve months, and his contract was accepted. At a later period he was elected as district councillor for the parish. Can he continue to supply the material, or is he disqualified? The contract includes getting the material, breaking, and carting on to the roadside.

Sec. 46, subsec. (2), of the Local Government Act, 1894, provides that a person shall not be disqualified for being elected or being a member or chairman of a council by reason of being interested in any contract with the council for the supply from land of which he is owner or occupier of stone, gravel or other materials for making or repairing highways or bridges, or in the transport of materials for the repair of roads or bridges in his own immediate neighbourhood. The contractor in question appears to come within this proviso, and can therefore, I think, continue to supply and transport the material without being disqualified. I presume it is usual in contracts of this nature for the quarry owner to get and break the material, and I think these processes can reasonably be considered as incidental to supplying it.

PRIVATE STREET WORKS: INCIDENTAL EXPENSES.—"Frontager" inquires if, under the Public Health Act, 1874, sec. 150, the council are empowered to claim any expenses incurred by them before service of notice on the frontagers in connection with cost of surveys, preparation of plans, estimates, &c. Are they entitled to charge a percentage on the outlay, or should the expenses be treated as the actual expenditure? Would the local authority be entitled to include in the cost of carrying out the work any expenses of the surveyor or clerk in connection with work done by themselves with reference to plans, preliminary notices, and also with respect to preparation of surveys and apportionments?

This is a doubtful point. In *Walthamstow Local Board* v. *Stow* (1891, 2 Ch. 606, 31) Justice Chitty expressed the opinion that incidental expenses such as surveys, plans, superintendence, notices, &c., could be included in the estimate, but the Court of Appeal was doubtful, and left the point undecided. In *Re Hanwell Urban District Council and Sykes* (48 J.P., 486) Mr. Justice Channell held that the council could not charge £5 per cent to cover office and incidental expenses. In proceedings under the Private Street Works Act, 1892, a commission of £5 per cent in respect of surveys, superintendence and notices may be included in the estimate (sec. 9, subsec. (2)).

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, A.M.I.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bridewell Place, E.C. *Envelopes must be marked* Assistants' Section. *Letters, drawings, or communications are invited to submit questions for consideration, and answers to the questions which appear. For the best communication on a subject to be chosen by the Editor a monthly prize of books will be awarded. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The prize for December is awarded to

Mr. P. Hamilton,
Hyde House,
Sadler-street,
Wells.

QUESTIONS.

This week answers are invited to the following questions:

445. Cement Testing. Sketch and describe the apparatus necessary for conducting the briquette, weight and specific gravity tests for Portland cement.

446. Materials. What is Mexican asphalt? Is it a natural product? Are Trinidad Lake asphaltic cements merely a trade term for a brand of petroleum? In the former event part of Mexico does not come under the F. W. Z. standard.

447. Geodesy. Explain what is meant by "Geodesy." What is meant by a "base of verification"?

449. Roof Truss. Sketch a light iron roof truss for a span of 20 ft., and give constructional details of the joints.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

448. Hydraulics. Explain and illustrate by reference to a stream of rectangular section, 12 ft. wide and 3 ft. deep, the terms "hydraulic mean depth" and state in what manner and approximately to what extent the mean velocity of the stream would be affected by widening it to 24 ft., keeping the depth and inclination the same. (A.M.I.C.E.)

The "hydraulic mean depth" is defined as

$$\frac{\text{Cross sectional area of stream}}{\text{wetted perimeter}} = \frac{a}{P}$$

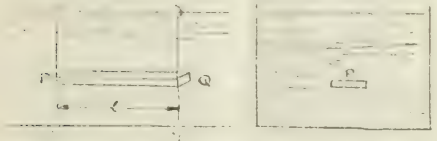
For a rectangular section 12 ft. × 3 ft. area = 3 × 12 = 36 sq. ft.; perimeter = 12 + 3 + 3 = 18 ft.

$$\text{Hydraulic mean depth} = \frac{36}{18} = 2 \text{ ft.}$$

For rectangular section 24 × 3: area = 72 sq. ft., perimeter P = 24 + 3 + 3 = 30.

$$\text{Hydraulic mean depth} = \frac{72}{30} = 2 \cdot 4 \text{ ft.}$$

Consider a small length l of stream, say 10 ft., between sections XX and YY.



Let Z ft. be fall of surface between XX and YY and let i be inclination, i.e. fall per foot length of surface of water, then $i = Z/l$ of inclination is small.

Consider a small filament of liquid PQ, such that velocity is the same at any point in PQ and P and Q are same depth below the surface.

Energy per unit volume at point P = $p + w$ (where p = pressure per unit area and w = weight per unit volume) and pressure at Q = $\left(p + \frac{dp}{ds} l\right)$ since pressure and pressure at P and Q. The pressure at P is the sum of the pressure at P and Q since [illegible] and from these equations [illegible]

If Q and P are [illegible] the latter by $\frac{dp}{ds} l$ the latter by $\frac{dp}{ds} l$ [illegible]

[illegible]

[illegible]

$$\frac{dp}{ds} l$$

hydraulic mean depth, and the type of formula connecting [illegible] for J.

[illegible]

$$J = \sqrt{\quad}$$

[illegible]

$$= \left(\quad\right)$$

[illegible]

$$\sqrt{\quad}$$

[illegible]

$$\frac{1}{1 + \frac{\quad}{\sqrt{\quad}}} \qquad \frac{1 \cdot 1}{1 + \frac{\quad}{\sqrt{\quad}}}$$

Where [illegible] channel.

[illegible] = 2

[illegible] = 5

[illegible] proportional to the square of the velocity. This does not hold in all cases, and logarithmic formulæ are substituted, in which the resistance is assumed to be proportional to some power of v not necessarily 2.

[illegible] where [illegible] determined experimentally for various conditions.

Taking case of [illegible] and using Bazin's Formula in which $c = \cdot 5$.

$$\frac{157 \cdot 5}{1 + \frac{\cdot 5}{\sqrt{\quad}}}$$

Section 12 × 3 =

$$\text{Hydraulic mean depth} = 2 \qquad \frac{157 \cdot 5 \sqrt{2}}{1 + \frac{\cdot 5}{\sqrt{2}}} \sqrt{2} = 161 \sqrt{\quad}$$

Section 24 × 3 =

$$\text{Hydraulic mean depth} = 2 \cdot 4 \qquad \frac{157 \cdot 5 \sqrt{2 \cdot 4}}{1 + \frac{\cdot 5}{\sqrt{2 \cdot 4}}} \sqrt{2} = 181 \sqrt{\quad}$$

Since [illegible] in each case, the [illegible] channel (24 × 3) with the larger value of m, is greater

velocity than that in the channel (12 × 3), the velocities being in the ratio 181 : 364. (W. R. H., *Fulham.*)

The "hydraulic mean depth" is the ratio between the cross section of the water and the length of the wetted perimeter.

In the given stream the H.M.D.

$$(a) \qquad \frac{12 \times 3}{3+12+3} = 2$$

The resistance to the flow varies inversely as the H.M.D.

(*b*) If the stream were 24 ft. wide the H.M.D. would be $\frac{24 \times 3}{3+24+3} = \frac{12}{5} = 2{\cdot}4$

$\therefore$ H.M.D of *a* : H.M.D. of *b* :: 2 : 2·4

:: 1 : 1·2

The velocity varies directly as the resistance to flow, so the velocity will also vary as 1 : 1·2. (S. M. M., *Grimsby.*)

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Hoddesdon U.D.C. (December 14th. Mr. F. H. Tulloch). £900 for the extension of the cemetery.—It was explained that the council considered the purchase necessary in anticipation of future requirements.

Holme Cultram U.D.C. (December 17th. Mr. H. S. Bidwell).—£1,200, supplemental loan, in respect of the Silloth sea wall.—Up to August last year £17,000 had been spent on the work, and of the £1,200 now wanted it transpired that £252 was the amount by which the last loan was overspent. Part of this £252 had been spent in planting trees, making gravel walks and purchasing seats, thus making a pleasure ground on the land side of the wall. One of the councillors contended that this expenditure ought not to have been defrayed out of the loan for the wall. The inspector said this expenditure would appear to be ultra vires, and he asked for full details of it, which the engineer undertook to supply. Information having been given with regard to the shifting of the channel, the inspector said it would appear that what they might originally call a £5,000 wall was going to cost £20,000 before it was finished.

Huddersfield T.C. (December 22nd. Mr. R. C. Maxwell).—This was an inquiry with regard to the sanitary requirements of the town.—The town clerk, Mr. J. H. Field, explained that under a local Act the corporation had power to compel owners, at their own cost, to convert to the water-carriage system. For various reasons they had only made limited use of this power, but they wished to extend it to mills and workshops. The corporation also applied for a Provisional Order authorising them to contribute in their discretion the whole or part of the cost of conversion, and they also asked for borrowing powers. The medical officer of health, Dr. S. G. Moore, said Huddersfield was a somewhat peculiar town, for it was really a small county. For example, there were 235 farmsteads in the borough, and obviously in certain districts there were no sewers, and there would not be any until the density of the population necessitated their provision. The death-rate was practically that of a health resort. It had fallen from 24 per 1,000 in 1871 to 13 at the present day. In the course of the proceedings it was stated that the total cost of the conversion would be £140,988, but the saving in scavenging would be £7,818 a year.

Llandudno U.D.C. (December 29th. Mr. Edgar Dudley).—£1,225 for laying out a golf course of nine holes on the estate on the Deganwy side of the town, which was recently purchased at a cost of £13,000. —The clerk, Mr. Alfred Conolly, stated that the council had entered into a contract with the firm of Messrs. Franks, Harris & Co., Limited, of Guildford, to lay out the links. Mr. C. D. Harris, of this firm, would appoint a foreman to direct the work, and the council would supply the necessary labour. The formation of the greens and bunkers would cost about £750, and drainage, in one place, and the other work would bring the cost of the first nine holes up to £1,225.

Lurgan U.D.C. (December 28th. Mr. P. C. Cowan).—£270 for the carrying out of a scheme for the diversion of flood water in the Queen-street (Ballyblough) district, and a supplemental loan of £1,200 for completing the erection of fifty-four artisans' dwellings in Wellington-street.—It was explained that the lands on the south-east side of the town were higher than the town itself, and the drainage had to pass through the town on its way to Lough Neagh. In times of heavy rain the sewer into which the water discharged was unable to receive the volume of water which emptied into it, with the result that the districts in that part of the town were flooded, and it was to do away with this flooding that the loan of £270 was sought. The other loan was for the completion of the council's housing scheme, for which a loan of £10,000 had already been sanctioned, but had proved inadequate.

Middlesbrough T.C. (December 17th. Mr. P. M. Crosthwaite).—£4,603 for the improvement of Acklam-road.—It was stated that the council propose to construct a new highway 60 ft. wide, through the old Linthorpe Brick Company's yard, and that the new road would cut off a very awkward and dangerous corner.

Worcester T.C. (December 16th. Mr. Edgar Dudley).—£3,400 for an improvement at St. Martin's-gate.—It was explained that a considerable proportion of the proposed loan was required for the purchase of property in connection with the scheme. The inspector referred to the width of the street proposed. It did seem rather inadequate, he said, to spend £3,000 on a street 30 ft. wide. He suggested another 3 ft.

APPLICATIONS FOR LOANS.

Brampton R.D.C.—£3,600 for water supply works.

Ilford U.D.C.—£788 for bowling green and tennis courts, and £170 for a public convenience.

Llandudno U.D.C.—£926 for a new feeder electricity cable.

Macclesfield T.C. £8,689 for the extension of the isolation hospital.

Wigton R.D.C. £6,000 for water supply works.

LOANS SANCTIONED.

Barking U.D.C.—£4,300 for the purchase of land for a playing field.

Bury T.C.—£4,500 for road diversion.

Cockermouth R.D.C.—£800 for sewerage works.

Dewsbury T.C.—£20,422 for the erection of eighty-four workmen's houses.

Ipswich T.C.—£1,900 for adapting a motor boat as a motor sludge boat.

Islington B.C.—£4,975 for electricity extensions.

Newbury T.C.—£1,000 for re-roofing the Corn Exchange.

Stamford T.C.—£4,229 for the erection of houses.

Tamworth T.C.—£1,400 for work in the new recreation ground.

Wirral R.D.C.—£5,928 for sewerage works.

FORTHCOMING INQUIRIES.

JANUARY.

	£
5.—**Burton-upon-Trent.** For work of sewerage and the construction of a rising main (Mr. R. G. Hetherington)	31,700
5.—**York.** For the purposes of the electricity undertaking (Mr. H. R. Hooper) ..	19,150
7.—**Repton.** For sewerage and sewage disposal works (Mr. R. G. Hetherington)	1,700
7.—**Stockport.** For electricity purposes (Mr. H. R. Hooper)	17,000
8.—**Chepping Wycombe.** For sewerage and sewage disposal works (Mr. R. G. Hetherington)	49,010
8.—**Ramsgate.** For the provision of bath, boxing, and public conveniences, and fencing (Mr. F. O. Stanford)	6,783
8.—**Salford.** For the purposes of the electricity undertaking (Mr. H. R. Hooper)	22,910

Plymouth Water Undertaking.—The Corporation of Plymouth intend to promote a Bill for the enlargement of the municipal waterworks, including the provision of additional aqueducts, mains and pipes, and the extension of the area of supply.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear in this issue:—Buildings—Llanelly, Spring-head (Yorks), and town planning—East Preston (Sussex). Works—Bridlington, Failsworth, roads and traffic—Bath, Lancaster, Middlesex, Penge, Southwark, Wilton, sewerage and sewage disposal—Hornsey, Northwich, St. Columb, water supply—Bridlington, Treorky. Particulars of other works projected will be found in the "Local Government Board Inquiries" page.

BUILDINGS.

Llanelly T.C. It has been agreed to seek Parliamentary powers to appoint a joint board representative of the Llanelly Town Council, the Llanelly Rural Council, and the Bury Port Urban Council to erect and control an isolation hospital.

Newark T.C. Support battlements are to be erected adjoining the market hall, at a cost of £32.

Springhead (Yorks) U.D.C. Consideration having been given to this district of a scheme for providing the inhabitants of Saddleworth, Springhead, and Lees with a public park, the Local Government Board have intimated that they will be prepared to sanction a loan for the purpose.

Wolverhampton T.C. It is proposed to provide a roof of steel construction to replace the timber roof at the east portion of the municipal offices in Lichfield-road. The work is estimated to cost £200, and it is also proposed to provide a new steel gate, to cost £210.

HOUSING AND TOWN PLANNING.

Billinge U.D.C. The council are asking for sanction to a scheme for the provision of two working-class houses at Garswood.

Caistor R.D.C. Loans are being applied for for the erection of houses at £309, £301, and £225 respectively.

East Preston (Sussex) R.D.C.—The Local Government Board having approved the council's housing scheme, it is proposed to borrow £1,000 for the erection of cottages at Angmering.

Stourbridge T.C. The usual steps have been taken for promoting a scheme for the erection of artisans' dwellings within the borough area.

Watford U.D.C.—By the housing scheme, which has been approved, it is proposed to build 12 cottage houses in Wallow-lane.

PARKS AND OPEN SPACES.

Coventry T.C.—It has been agreed to spend £3,970 upon improvements at Central Green, including the enclosing of the land and the construction of a path 8 ft. wide, connecting Bailey-road and Willenhall-road. A bandstand is being erected, and is to be constructed at a cost of £500. The council have further decided to erect a pavilion in Spencer Park at an estimated cost of £1,100.

Exeter T.C.—An extension scheme is to be carried out at Northernhay Gardens, at an estimated cost of £205, according to plans prepared by the city surveyor, Mr. T. Moulding.

REFUSE COLLECTION AND DISPOSAL.

Bridlington T.C.—The council have confirmed a proposal of a joint committee to erect a refuse destructor on a site adjoining the electricity works off Quay-road.

Failsworth U.D.C.—A sub-committee has been appointed to visit several towns in order to inspect their dust destructors.

ROADS AND MATERIALS.

Amesbury R.D.C. The surveyor, Mr. J. T. Huxham, reported that he had received from the chief engineer of the Southern Command a report as in respect of the repair of about 7¼ miles of the Devizes road in the council's district in the neighbourhood of Rollestone Camp. The cost would be borne by the War Office. Heavy traffic was to be at once turned on to the road, and constant repairs would be necessary to keep the road in a fit state to bear it. The road by Larkhill had never been repaired by the council, and it would be wise to have it made clear that the council would not accept the liability to repair it after the war. He would want a constant supply of stone, and a large staff of labourers must be available. The council agreed to comply with the requisition of the military authorities.

Barking U.D.C. [illegible] has been asked to prepare a plan for widening Upney-[illegible]

Bath R.D.C. The council have sanctioned an [illegible] Mr. [illegible] to remove certain elm trees and plant an avenue of [illegible]

Colne T.C. [illegible]

Crompton U.D.C. [illegible] of Beal-lane with granite setts, at an estimated cost of £1,500.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, has received a requisition from the military [illegible] lane to Wych Cross at Forest-row, and the council have decided that the surveyor shall present the [illegible] that no extra expense fell upon the council.

Exeter T.C.—The council have approved a report by the city surveyor, Mr. T. Moulding, advising the [illegible] should be carried out departmentally.

Inverness C.C. The council have agreed to take over and maintain the Bays of Harris-road when completed.

Lambeth B.C. The council have adopted the recommendation of the Highways Committee that the [illegible] should be carried out departmentally.

Lancaster T.C.—A scheme has been approved for a 50-ft. road at the north end of the town to connect [illegible]

Maldens and Coombe U.D.C.—The total apportionments of the new roads taken over under the Private Streets Works Act since 1907 amounted to £19,665, or, including six new roads now in progress, at a [illegible]

Middlesex C.C. [illegible] Highways Committee reported recently that special consideration had been given to the question of repaving Seven Sisters-road, which had within the last few days been in such a condition that the police had to divert the traffic. It was to the interest of all concerned that the work should proceed at once. It was stated that the Hornsey Borough Council would [illegible]

Panteg U.D.C.—Upon the Llanfrechfa Upper Council agreeing to bear one-third of the cost, the council have approved a scheme for the construction of a road from Pontymoel to Llantarnam, at an estimated cost of £3,100, contributing a third themselves. The remaining third of the cost has been promised by the Road Board.

Ripon T.C.—An extensive scheme for the construction of roads to a new military camp in the town-[illegible] Regt. and Clothes-[illegible] the purpose.

Rowley Regis U.D.C.—Tenders are being invited for paving works in High-street.

Sheerness U.D.C.—The question of purchasing a stone breaker has been referred to the Works Committee for report.

Springhead (Yorks) U.D.C.—A sub-committee has been appointed to go into the question of improving several dangerous corners, and the county council have intimated that if it was decided to carry out

the work they would recommend it to the Road Board for a grant.

Stirlingshire C.C. Owing to a shortage of labour the road surveyor has been authorised to get certain improvement works in the Kilsyth district carried out by contract.—Schemes of road widening and improvement, and the formation of footpaths have been prepared in order to meet distress in the event of this arising.

Stourbridge T.C.—The corporation have accepted the offer of the county council to contribute £300 towards the cost of a main road improvement at the corner of Coventry-street and High-street.

Wilton R.D.C.—A considerable scheme of road work was reported upon by the surveyor, Mr. R. A. Skelton, recently, and the council agreed to approve it upon the condition that the military authorities would guarantee to repay the cost. The surveyor's statement was that, by request, he had met engineers representing the War Office and the Road Board respecting the damage which had been done to the roads in the district by War Department traffic. There were also present the surveyors of the adjoining districts and the county surveyor. He was informed that the War Department wanted certain roads repaired and improved, and that they would request the council to do the work, and that the War Department would repay the cost. With regard to the district roads, he had that day received from the War Department a requisition for the repair of the Devizes, Bemerton to Berwick, Kingsway, and New Cut, South Newton, and Stoford Bottom roads. The repairs were to be put in hand at once, and in the meantime an estimate was to be made out and sent to the Road Board. He understood that, as soon as the estimate was approved, the council would receive a payment on account. With regard to the carrying out of the work, he would want at least fifty men, and also extra steam rollers.

SEWERAGE AND SEWAGE DISPOSAL.

Devon C.C. It has been agreed to make a contribution of £240 to the St. Thomas Rural District Council towards the cost of repairs to the sewage tanks at Exminster.

Haslemere U.D.C.—It has been decided to carry out an improved scheme of sewage disposal, at an estimated cost of £7,000.

Ipswich T.C. A scheme has been prepared by the Sewerage Committee, and is still under consideration, for raising the sewage at the outfall, for chemically precipitating the suspended solids, and otherwise dealing with it in such a manner as will secure efficient sedimentation. The extraction of the coarser solids by means of screens will be continued, and the committee believe that the suspended matter which is the cause of the trouble in Fen Bight will be so efficiently removed under the new arrangement that the effluent may safely be discharged into the Orwell estuary without the intervention of filter-beds.

Maldens and Coombe U.D.C.—Consideration of the suggestion of Mr. R. H. Jeffes, the surveyor, that an experimental trial of osier-growing on the part of the new sewage disposal area should be made has been deferred.

Northwich R.D.C.—A decision has been reached to proceed with a sewerage scheme at Rudheath.

St. Columb R.D.C.—The Local Government Board have written stating that, after considering the report made by their inspector with reference to the scheme of sewerage for houses in Atlantic-terrace, Trevone, they concurred in the view that a scheme for Atlantic-terrace was an immediate necessity, but they also thought that the whole of the village of Trevone required sewering, and that the question of a comprehensive scheme ought to be considered at the present stage; and, further, that they would not be prepared to approve any scheme providing for an outfall into the sea until float experiments had been made at the proposed point of discharge. They requested the council to reconsider the matter, and inform the board whether they were willing to submit a comprehensive scheme. The council resolved to ask the board whether they were prepared to sanction the original scheme if the float experiments proved satisfactory.

Settle R.D.C. Plans have been referred to the local committees of Settle, Langcliffe, and Giggleswick of a proposed sewerage scheme which is estimated to cost £4,750.

Stirlingshire C.C.—Alternative schemes have been prepared for sewage disposal at Cambuslang, and the matter is still under consideration. The proposed schemes, which have been prepared by Mr. Greig, Stirling, are: (1) A drainage system, with sewage disposal works at Cambusbarron, and the effluent discharged into the burn; (2) a drainage system with the sewage piped to the river Forth, and with settling and sludge tanks there; (3) a drainage system with the sewage piped to the Raploch, if terms can be arranged with the town council for joining the town sewer there.

Uxbridge R.D.C. The surveyor, Mr. J. W. Harrison, has received instructions to prepare a scheme of sewage disposal for Harefield. The estimated cost is £1,000.

WATER, GAS, AND ELECTRICITY.

Evesham R.D.C.—The council have resolved to proceed with the Harvington water supply scheme, the estimated cost of which is £2,500.

Nantwich R.D.C.—Considerable extensions to the water mains have been decided upon, and the work will be carried out in four sections.

Tetbury U.D.C.—A proposal is under consideration for an improved water supply scheme, estimated to cost £3,150.

Ystradgynlais R.D.C. It is proposed to make extensions of the water supply, at an estimated cost of £1,500.

MISCELLANEOUS.

Falmouth T.C.—The plans of the borough surveyor, Mr. J. S. Walton, have been approved for the extension of the cemetery on a site offered by Lord Kimberley.

Poole T.C. The council have adopted the scheme of the medical officer of health for establishing and equipping a municipal laboratory, at an estimated initial cost of from £20 to £30 and an estimated annual cost of £53. The laboratory, it was stated, would make it possible to carry out locally bacteriological examinations which at the present time were made in London at a cost of about £100 per annum, and would, moreover, have the advantage that the results of these examinations would be procurable much earlier than at present.

PERSONAL.

Mr. A. B. McDonald, M.Inst.C.E., city engineer of Glasgow, has been voted a retiring allowance of £500 a year.

Mr. John C. Miller, assistant borough surveyor of Helensburgh, has been appointed borough surveyor of Inverkeithing.

Mr. F. G. Coates, junior assistant in the surveyor's department, Clacton-on-Sea, has been appointed second assistant to the borough surveyor of Guildford.

Mr. J. W. Hill, assistant in the borough surveyor's department, Stoke-on-Trent, has been appointed assistant in the Birmingham rivers and sewage department.

Mr. A. Burton, engineer and surveyor to the county borough of Stoke-on-Trent, has been transferred from the class of associate-member to that of member of the Institution of Civil Engineers.

Mr. Thomas Moulding, city surveyor of Exeter, was on Tuesday last at the town council meeting congratulated by the Mayor (Mr. J. G. Owen) upon his election as a fellow of the Royal Sanitary Institute.

Proposed By-pass Road in Surrey.—The borough surveyor of Kingston-on-Thames, Mr. R. H. Clucas, has prepared an alternative scheme to the Road Board's proposal for a by-pass arterial road from Kingston Vale to Esher, and the proposal has received the approval of a conference of road surveyors of Greater London, and the concurrence of the Highway Committee of Kingston, who have directed a copy of the surveyor's plan to be sent with a covering letter to the Local Government Board. The proposal of Mr. Clucas is that there shall be a new road commencing at the junction of London-road and Cambridge-road North-ton, and passing along the track of the Metropolitan Water Board's mains to the junction of Surbiton-road and Beaufort-road, near the Surbiton Assembly-rooms.

SOMERSET ROADS AND BRIDGES.

COUNTY SURVEYOR'S REPORT.

Mr. Edmund Sharpe, Assoc.M.Inst.C.E., has issued his first annual report as county surveyor of Somerset, a position relinquished last year by Mr. H. P. Cooper, who is now assistant county surveyor of Kent.

The mileage of main roads in the county, to which the report refers, works up at 871·90 miles, and there are 81·69 miles of urban highways. The estimated expenditure for 1914-15 is £102,673, or £107 6s. per mile, as compared with £92,658, or £97 2s. per mile, in the year under review. In the year 1913-14 the estimated expenditure on rural roads was £76,311, and that on urban roads £6,155, or £87 8s. and £129 per mile respectively. This year the figures are: Rural roads, £89,209 12s. 4d. per mile, and £6,751 £259 3d. per mile. These sums however do not exhaust the amounts allowed for establishment charges or those granted for bridges, improvements and main roads.

It has to be noted that in 1914-15 the county has taken over 9·96 miles of urban roads, and the figures for rural roads being £87 2s. 6d. per mile, and that for urban roads £14,467 - £177 3s. per mile.

The report mentions that 90·96 miles of rural roads are maintained directly by the rural district councils' own workmen in eleven (one partially) districts, and that 38·96 miles are [illegible] in seven (one partially) districts.

The estimated expenditure for 1914-15 included in the rural estimates for 1914-15 are as follow: Crumble £1,092, [illegible] £1,076, [illegible] £1,076, [illegible] £1,076

NANTWICH RURAL DISTRICT COUNCIL.

AUDLEM AND DISTRICT: WORKS OF WATER SUPPLY.

CAST-IRON PIPES, HYDRANTS, SLUICE-VALVES, CASTINGS, &c.; EXCAVATING FOR AND LAYING AND JOINTING WATER PIPES, &c.

The above Council is desirous of receiving Tenders (Contract No. 1) for about 2,100 tons of Cast-iron Water Pipes, Branches and other pieces; (Contract No. 2) for Hydrants, Sluice Valves, Fittings, &c.; and (Contract No. 3) for Excavating for and Laying, Fixing and Jointing about 50 miles of Cast-iron Water Mains, with all the necessary Sluice Valves, Hydrants, Fittings, &c., in connection with the above-mentioned works of water supply in the Rural District. Separate Tenders will be required for each Contract, and for the four sections (each approximately 12½ miles) in Contract No. 3, but one Contractor may tender for the whole.

The Council does not bind itself to accept the lowest or any Tender, and reserves the right to sub-divide the Contracts in such manner as may be deemed expedient.

Drawings and Specifications may be seen at the Offices of Mr. C. E. Davenport, ASSOC.M.INST.C.E., 152 Hospital-street, Nantwich, from whom copies of Specifications, Quantities and Forms of Tender may be obtained on the deposit of Two Guineas, which sum will be refunded on receipt of a *bonâ-fide* Tender and the return to the Engineer of all documents received from him.

Sealed Tenders to be sent in to me not later than Four o'clock in the afternoon of Thursday, the 28th January next, endorsed "Tender, Audlem, &c., Waterworks."

(By order)
H. G. ATKINSON,
Clerk to the Council.

Rural District Council Offices,
Nantwich.
December 30, 1914. (2,211)

NANTWICH RURAL DISTRICT COUNCIL.

CAST-IRON PIPES, HYDRANTS, SLUICE-VALVES, CASTINGS, &c.; EXCAVATING FOR AND LAYING AND JOINTING WATER PIPES, &c.

The above Council is desirous of receiving Tenders (Contract No. 1) for Cast-iron Water Pipes, Branches and other pieces; (Contract No. 2) for Hydrants, Sluice Valves, Fittings, &c.; and (Contract No. 3) for Excavating and Laying, Fixing and Jointing Cast-iron Water Mains, with all the necessary Sluice Valves, Hydrants, Fittings, &c., for purposes of water supply in the Township of Ridley, in the above-named Rural District. Separate Tenders will be required for each Contract, but one Contractor may tender for the whole. The Council does not bind itself to accept the lowest or any Tender.

Drawings and Specifications may be seen at the Offices of Mr. C. E. Davenport, ASSOC.M.INST.C.E., 152 Hospital-street, Nantwich, from whom copies of specifications, Quantities and Forms of Tender may be obtained on the deposit of ten shillings, which sum will be refunded on receipt of a *bonâ-fide* Tender, and the return to the Engineer of all documents received from him.

Sealed Tenders to be sent in to me not later than four o'clock in the afternoon of Friday, the 15th January next, endorsed "Tender, Ridley Waterworks."

(By order)
H. G. ATKINSON,
Clerk to the Council.

Rural District Council Offices,
Nantwich.
December 30, 1914. (2,210)

HIRE OF TRACTION ENGINES.

The above Council wish to Hire, immediately, Traction Engines to haul a large quantity of broken limestone from Railway Stations in this District to Store Depots.

R. A. SKELTON,
District Surveyor.

Bemerton, Salisbury.
December 22, 1914. (2,213)

DIARIES AND CALENDARS.

A notable feature of Charles Letts' pocket books and diaries is the accident insurance coupon, first introduced in 1895. The popularity of this feature is extraordinary, nearly 200,000 registrations being effected annually, among those insuring being several members of the Royal Family and many men of note in all professions and trades. The insurance privileges are much enhanced for 1915; they provide a weekly payment in the event of certain forms of sickness, and, in addition, injury or death due to bombs dropped by hostile air-craft are covered, an up-to-date feature which will doubtless be appreciated.

Among the new diaries for 1915 there is one in particular which at this time is sure to meet with a very large demand—we refer to "The Soldiers' Own Diary"—published at 1s., a most excellent publication for soldiers on active service. The information is useful, and contains an abridged list of English-French words and phrases, and the book is thin and compact, so that it may readily be carried in the pocket.

Another notable diary is "The Investors' Diary and Notebook," one of the cheapest 1s. diaries we have seen; it is well got up, and contains much useful information to investors.

The general compilation of Charles Letts' diaries is under the immediate supervision of Mr. Letts, than whom it is safe to say no one has had greater experience. To each and every detail of manufacture the greatest care is given. The papers are really good, and each diary is admirably adapted for the purpose for which it is intended.

Over 15,000 of these diaries for 1915 have, we understand, been ordered by His Majesty's Stationery Office for the use of various Government departments. Sir Ernest Shackleton also entrusted Messrs. Charles Letts with his order for diaries and journals for the Trans-Antarctic Expedition of 1914-15, and in further proof of their worth Messrs. Charles Letts & Co. have just been awarded the Gold Medal and Grand Prix both at the Milan and Genoa Exhibitions.

The London and Lancashire Fire Insurance Company, Limited, issue, as usual, a very handy case, with back-loop, pencil and pockets, containing a day-to-the-page diary for January, 1915. For this may readily be substituted a refill for each succeeding month as it comes round. The company also issue a tastefully painted tear-off calendar for the coming year.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

President—Mr. J. W. CROXFORD.
Vice-president—Mr. R. H. Jeffes.

A meeting of the association will take place at Wimbledon to-morrow (Saturday), the 2nd inst., at 3 p.m.

AGENDA.

(1) Visit the S.C.S. works, sewage works, Durnsford-road, Wimbledon, and see—(*a*) The products obtained by subjecting sewage sludge to destructive distillation, and (*b*) the treatment of sewage by certain products obtained.
(2) Visit cemetery extension.
(3) Open-air bath, Wandle Park.
(4) Tea and hot-pot, Wandle Park House, at 5 p.m.
(5) Meeting of the association and friends at Wandle Park House at 6 p.m.
  (*a*) Minutes of meeting held on December 5th to be read and confirmed.
  (*b*) To consider matters arising thereout (if any).
  (*c*) Correspondence.
  (*d*) Papers by Mr. C. H. Cooper, entitled (1) "Method of Storing Water for Open-air Bath in the Gravel Beds"; (2) "Road Direction Signs."
  (*e*) Questions by members (if any).
  (*f*) General business.

J. G. CAREY,
Hon. Sec. and Treasurer.

CONCRETE INSTITUTE.

[illegible]

H. KEMPTON DYER,
Secretary.

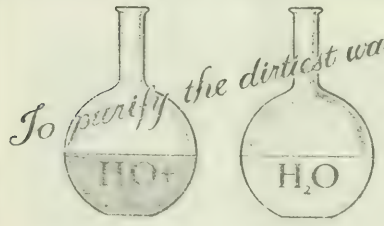
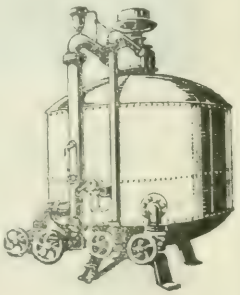
A Universally-Adopted System of Water Purification.



SOME time ago we received an order for 32 of our Patent Mechanical Filters from the Sheffield Corporation for the Loxley Valley Scheme. They proved so satisfactory that a contract was placed for a further 24 for Derwent Water Works. To date, the total capacity of our Filters exceeds 150 million gallons per day. Our

PATENT MECHANICAL FILTER

will purify the most contaminated water, and free it from all matter in suspension, discoloration, bacteria, and acidity. Our filter is of the simplest construction and needs but a few minutes' attention daily. This advantage, together with the small quantity of wash water required, reduces maintenance charges to a minimum.



Our wide experience of

plans in connection with

Mather & Platt, Ltd.

MANCHESTER and LONDON.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. JANUARY 8, 1915. No. 1,199.

Minutes of Proceedings.

Housing in 1913-14—(II.).

In continuation of the remarks which appeared in our last issue concerning the report of the Local Government Board on Housing and Town Planning in 1913-14, we now desire to direct attention to the extraordinary progress made during the year in the provision of dwellings by local authorities under Part III. of the Act of 1890. In this, as in every other branch of housing work, something like a boom seems to have occurred since the passing of the Housing, Town Planning, &c., Act, 1909, and the activities of local authorities in regard to building have received an impetus, the ultimate effect of which cannot at present be foretold. Thus, we find that during the year 1913-14 the number of local authorities who obtained sanctions to loans, the number of local authorities who obtained sanction for the first time, and the amounts sanctioned, all exceeded by something like 100 per cent. the numbers and amounts in any previous year since the passing of the Act of 1890. In view of the fear to which utterance is given from time to time in certain quarters that any considerable activity on the part of local authorities in the direction of house building will bring private enterprise to a standstill, considerable interest attaches to that part of the report in which this important question is analysed and discussed. Private enterprise has always been the main source of the provision of houses for the working classes, and in these columns the opinion has frequently been expressed that the local authority should only step in where there has been conspicuous failure on the part of private enterprise to meet the demand in any locality. Figures are not available to show the precise proportion of the new houses suitable for occupation by the working classes built in any one year by private enterprise and by local authorities respectively, but it may safely be asserted that of more than 5,500,000 houses shown in the report of the Commissioners of Inland Revenue for 1913 as exempt from inhabited house duty, not more than about 18,000 have been erected by local authorities. In regard to the incidental advantages of municipal building, the report mentions the raising of the standard of building by the private builder, and the practical knowledge gained by the local authority of the difficulties to be surmounted in complying with their own building by-laws. The latter advantage is apparently not secured by certain authorities, however, who take the easier course of themselves disregarding the by-laws which they enforce upon their competitors. Such disregard of by-laws is, of course, entirely illegal and utterly indefensible.

It must not be imagined, however, that the remarkable progress that has been made means that the gigantic problem of housing reform is within measurable distance of being solved. On the contrary, the reports of medical officers of health, and of the medical inspectors of the Local Government Board, continue to show that in many districts the provision of houses is insufficient or is not proceeding at a sufficiently rapid rate, and that the lack of good houses is hindering the local authorities in the matter of dealing with those which are unsatisfactory. There are many obstacles in the way of progress, and although it is mainly in the agricultural areas that real difficulty arises, the want of activity on the part of local authorities is by no means confined to these areas. The same reluctance to undertake building is to be found in some urban areas where houses are wanted and could be erected to let at rents which the working man would be able and willing to pay without any prospect of a charge on the rates such as there is in the agricultural areas, where the agricultural labourer has been accustomed to pay a rent insufficient to recoup the outlay on the cheapest form of cottage which can be erected even with the facilities afforded under the Housing, Town Planning, &c., Act, 1909. Nor is this reluctance always to be accounted for by the fear that decaying industries or seasons of slack trade may render the houses unnecessary or superfluous. The fact seems to be that in certain districts there is still a strong sentiment in opposition to the municipal provision of houses. Other difficulties arise by reason of the fact that in agricultural areas the persons for whom accommodation is directly needed have not been accustomed to pay an economic rent, while yet further obstacles of a special kind have to be overcome in certain districts, as, for example, the rapid rise and development of some new industry.

We cannot conclude this note without some reference to the hindrance to the provision of cottages which exists in many rural districts in consequence of unnecessarily severe and inelastic by-laws. This is a matter which has received considerable attention from the board, and in many districts revisions have already been made. Further, a number of councils of both urban and rural districts have submitted proposals for revising their by-laws so as to bring them up to modern standards, and the board take the opportunity, where cases of obsolete or defective by-laws are brought under their notice, to urge upon the authorities the need for making new by-laws more in accordance with present-day requirements.

* * *

Compulsory Purchase of Land.

There are few greater authorities on the acquisition of land by public and quasi public bodies than Mr. Andrew Young, and very special interest therefore attaches to the paper on the report of the Land Inquiry Committee which he read at the December meeting of the Surveyors' Institution. In the present state of the law, a special Act of Parliament, or its equivalent, is generally necessary before power to acquire land by compulsory purchase can be obtained. In certain cases, however,

local authorities are empowered by some general statute to acquire land for specified purposes by the mere passing of a resolution. The earliest statute of this kind was the Metropolitan Paving Act, 1817, commonly known as Michael Angelo Taylor's Act, and although the particular procedure under this Act is complicated and unsatisfactory, the principle underlying it is both useful and capable of extension and adaptation to modern requirements. Mr. Young expresses the opinion that it would be perfectly safe for responsible public authorities, including statutory companies, to be vested with general powers, exercisable by resolution only, compulsorily to acquire property required for the proper discharge of statutory duties.

Dealing next with the basis of compensation, Mr. Young pointed out that it is now well established that this should be the value to the owner of the land taken plus any loss he may sustain by its severance from his other lands, or by any injurious affection of such other lands. In some recent statutes, however, and in particular in those dealing with the clearance of insanitary areas, this basis has been modified. Thus in the Housing of the Working Classes Act, 1890, it is provided that if the rental arising from the property is enhanced by user for illegal purposes, or by overcrowding, the enhanced rental obtained by such conditions must be disregarded and a proper rental assumed, having regard to a fair and proper use of the premises, and this adopted for the purpose of calculating the compensation to be paid. Finally, Mr. Young dealt with the tribunal for assessing compensation, which is at present usually a jury of non-experts, although the claimant has the option of having the value determined by an arbitrator. In this respect the Land Inquiry Committee propose a drastic change namely, that in all cases where land is acquired under compulsory powers the final determination of the purchase price, the assessment of the compensation for severance and disturbance due to the claimant, and the apportionment of the compensation as between several claimants, should be determined by a body of Judicial Land Commissioners. Mr. Young agrees that the Land Inquiry Committee have established their case that the time has arrived when there should be an alteration in the normal tribunal for determining price where property is taken compulsorily. In his opinion, however, the scheme suggested by the Land Inquiry Committee is not a practical one, and the best tribunal would be one upon which surveyors would predominate; but, failing this, the general adoption of a single arbitrator, who should have complete powers enabling him to disallow witnesses whom he considers to have been unnecessarily called, as well as any costs he considers to have been caused or incurred unnecessarily.

Portable Chemical Fire Extinguishers.

The British Fire Prevention Committee, after an extensive [illegible] undertaken in July 1913, to meet the then increasing danger of badly made liquid chemical fire extinguishers the defects in which had resulted in fatalities by creating a standard pressure test for these appliances, namely, a pressure test at 350lb. and later in the year a provisional constructional specification was issued. This provisional specification met with the approval of the principal authorities concerned, and has served as a basis for the specifications since issued by several Government Departments and other public offices. Various slight improvements regarding the comprehensive provisional specification have been suggested from time to time, and further experiments have been carried out. The result is that the committee is now able to issue its completed specification, which has come into force as from January 1st, and covers all the general points as to size, strength, precautions against bursting, directions for use, and facilities for testing, of importance in such appliances.

In order to indicate that the committee's requirements are by no means so severe as to handicap the legitimate endeavours of the trade concerned in the production of chemical fire extinguishers, it should be mentioned that various makers are supplying appliances both to public tender and otherwise at a reasonable figure while complying with the requirements indicated in the committee's specification, and the public purchasing such hand fire appliances are thus advised in future to assure themselves that the British Fire Prevention Committee's specification is being complied with in respect to gear ordered. Copies of the specification are now available for free public issue, and lists of appliances complying with the specification will also be shortly prepared. Supplemental to the specification, some recommendations are added as to the maintenance of such extinguishers. The public are, however, reminded that portable liquid fire extinguishers are not the only form of portable first-aid fire appliance, but that ordinary buckets of water together with hand pumps are equally, if not more effective, in the majority of cases, and, further, have considerable advantages for ordinary household, office, shop and factory purposes.

Up-to-date Advertising.

It is frequently asserted, and usually not without good reason, that the British manufacturer, when he ventures to embark on a publicity campaign in other countries, fails lamentably in the all-important matter of the style of the advertisements which he frames in his endeavour to secure business. It would appear, however, that the "Eric" (Patent) Water-main Scraper Company, Limited, of Chepstow, Mon., whose now well-known machine, it will be recollected, was the subject of one of the papers read at the last meeting of the Institution of Water Engineers, are determined that something more than the mere announcement of their name and address is necessary in appealing to the American buyer, as witness the following advertisement which has been drafted for use in a Transatlantic engineering journal:

WHO SAID WATER-MAIN CLEANING?
We Can Save You Thousands of Dollars!

We can, and will, come over and clean your mains more efficiently, more quickly, and for less cash than you would have to pay any other water-main cleaning firm.

The explanation? Why, that's easy!

We have a machine patented in the States and other countries, that cleans mains by miles, not by yards or feet! Our machine is not antediluvian. It is not pulled through pipes by donkey winches. It is operated by the normal pressure of water in the mains and is self-propelled, whatever the pressure may be or little or no capacity, we don't have to equip you with a hundred horse-power engine and make a mess of your premises. We just run our machine on to the most suitable hydrant for getting rid of the mud.

We can't tell you more about it in the advertisement; we want you to mail or wire us for full particulars. It will be worth your while. We can quote you from here if you will tell us frankly all about your work; but it must be *big work*, you will understand, to bring us over.

You can get a copy of our booklet on "Water-main Cleaning Extraordinary" from the publisher of "Fire and Water" free for the asking. Please do this, and then write us. You will see why!

THE ERIC PATENT WATER-MAIN SCRAPER CO., LTD.,
Chepstow, Mon.

It must be conceded, after reading the above, that the Eric Company possess not a little of the pushfulness of the wonderful little machine that bears their name, and that they, at any rate,

council be a matter of doubt to appreciate the value of a sensible municipal engineer.

* * *

The Air Space above Streets.

In our recent remarks on the subject of the Liverpool Corporation Act, we pointed out that the statutory right of an urban authority to erect posts in their city streets in such a manner as to obstruct the public use of the streets for [illegible] was [illegible] to apply to the case of the Overhead Wires Act, 1908. In *Blount v. Bristol Electric Tramways Company* ([1902] 1 Ch. D. 565) it was held that the board had no proprietary interest above the street except when necessary to protect the street and the traffic from [illegible] or danger, or to enable them to exercise their powers in the street. Therefore the Court refused an injunction against the erection of a telephone wire stretched across a street at a great height, and causing no appreciable danger to the public. This was followed by *Finchley Electric Light Company v. Finchley Urban District Council* (1907, 1 Ch., 437) where the company carried across a street at a height of 30 ft. two posts and to support a cable carrying a supply of electricity to the house of a customer. The street was an old turnpike road, which had been converted into a turnpike trustee, and some [illegible] was made by the council to show that, for technical reasons, the principle did not apply. But the attempt did not succeed. It was held that the extent of the "area of user" was a question of fact, and that so long as the company did not encroach beyond that area they were entitled to carry their wires across the street. But for the purpose of the exercise by the local authority of their own statutory powers of lighting the district, the area of user may extend above that required for strictly highway purposes. This is shown by *Farnham Local Board v. Smith* (90 L.T., 467), in which the board contracted with an electric light company for the lighting of their district, and the company, in pursuance of their contract, erected posts in, and carried wires over, a street. The defendant, who claimed to be the owner of the subsoil of [illegible] the road, threatened to remove them, but an injunction was granted restraining him from so doing. Thus it will be seen that the limits of the "vested" area are not more definite in an upward than they are in a downward direction, and may differ in different streets and under varying circumstances.

* * *

Irish Councils and Cottage Building.

We learn from the *Irish Builder and Engineer* that at the last meeting of the Callan (co. Kilkenny) District Council it was reported that a considerable quantity of the council's property, in the shape of building materials, had been stolen from the sites of new cottages now being built by direct labour. It was stated that the loss had been reported to the police, but that no one had been made amenable. The clerk of the council stated "that if the council had taken his advice the council would not have touched 'direct labour' cottages again, as they had proved a failure all over Ireland." A member of the council stated that the Callan Council would not again touch direct labour cottages. It was stated that, in consequence of the slates being delivered before the cottages were half built, they were lying there a full year, and quantities of them were stolen. A considerable difficulty appears to arise in regard to getting the cottages built, and in some cases cottages were built and the timber on them left exposed for six months. This state of things may be due to a variety of causes, each more or less connected one with the other, or it may be due to a combination of causes under the influence of local economic conditions. It would surely be deplorable, however, if the [illegible] of the Irish Councils [illegible] cottages could be shown to be [illegible] cates claim for it. Its success depends largely upon the constancy and efficiency of the supervision that are bestowed upon it, and it ought not to be beyond the power of [illegible] that the supervision is duly exercised. It is not without significance that in another direction, that of road work, the tendency in Ireland, under the advice of the county surveyors, is to extend the [illegible] of road labour owing to the satisfactory results obtained from contract work. Anyway, if there is any real ground for the [illegible] of the clerk to the Callan Council in the matter of cottage building, there would appear to be ample room for a [illegible] inquiry into the cause or causes of the evil.

Military Earthworks.

In view of the possibility [illegible] called upon to carry out entrenching or similar works for the military authorities, the subject of military earthworks, upon which Mr. Bertram Hartfree writes in another column, is of considerable present interest. In modern warfare some form of cover is an absolute necessity, and if, as is usual, the character of the ground upon which operations are in progress does not afford natural places of concealment, entrenching and the construction of earthworks must be undertaken. The object of the simplest form of artificial cover in open country is for the individual soldier to secure a screen from which he can deliver a powerful fire on his foe, but which at the same time will, as far as possible, [illegible] It is, of course, a long way from this simple construction to the complete trench, tunnelled under, with recesses for storing food and ammunition, and a "Savoy Hotel" for rest and refreshment, which is now in common use at the front. But the principles are the same namely, shelter and concealment. In Mr. Hartfree's article certain simple rules will be found for the guidance of the municipal engineer in constructing such works, and in the effective disposition of obstacles, by the use of which the value of defence works can be greatly enhanced.

* * *

Waste Liquors from Paper Mills.

The second of the series of articles upon the treatment of trade wastes, which appears this week on another page, indicates some of the difficulties which are encountered in the disposal of the liquid wastes from the trade of paper making. Undoubtedly much can be done by the manufacturers themselves, often at very little or no expense, and in some cases with profit, by treating their wastes for the recovery of fibre and soda, which would otherwise be wasted. All these wastes are sterile, and do not lend themselves to biological treatment, as stated in the article, so that improvements can only be made by discovering methods of settlement and straining by chemical and mechanical means which shall be more efficient than those at present in use. Any process which would get rid of the resultant sludge more [illegible] would also be welcomed.

* * *

"The Surveyor" Special Issue.

We recently made a request in this column that returns of municipal works projected for 1915 should, in order to ensure their appearance in our forthcoming Special Issue, be despatched to us without delay. While the response to this appeal has been in every way satisfactory, we would urge upon those of our readers who have not yet submitted their forecasts to arrange that these shall reach us in the course of the next few days.

The Purification of Waste Liquors from Paper Mills.—(2).

By G. BERTRAM KERSHAW, M.AM.SOC.C.E., M.INST.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

The treatment of wastes resulting from the manufacture of various kinds of paper is a matter which frequently demands attention in various districts. There is a large number of mills running in this country, most of them lying in Lancashire, Kent, Buckinghamshire, and Aberdeenshire, though they occur in many rural districts where there is a sufficient and suitable "water privilege."

Very many different types of paper are made, such as writing and drawing papers, newspaper, wall and blotting paper, brown paper, &c. As a general rule, one mill turns out one particular type of paper only: thus, a "brown" mill will confine its operations to the production of various qualities of brown paper; a "news" mill generally manufactures wood-pulp papers, or papers chiefly of wood pulp with a little esparto grass; while "white" mills make various qualities of writing papers, using esparto or rags, or both.

The nature of the raw materials employed in making the paper naturally influences very largely the character of the waste liquids produced; consequently some mills have much more difficulty than others in treating their wastes. For example, "brown" paper mills generally employ as their raw materials old sacking, ropes and tarpaulin, peat, straw, waste coloured papers, and dirty waste pulp from other mills, and the waste waters from such mills are difficult to purify efficiently. On the other hand, mills producing high-class notepapers, and employing esparto and rags, with sometimes a little wood pulp, produce liquid wastes which, with the exception of the kier liquors, are more amenable to treatment. Newspaper mills, whose staple material is "chemical" wood pulp, turn out wastes which are probably easier to deal with than those derived from any of the other branches of paper manufacture.

The bulk of the wood pulp used in this country is imported from Scandinavia and Canada, and during the early stages of the present war it was very noticeable how the newspapers diminished in size, owing to the shortage of imported wood pulp. "Chemical" pulp, it may be noted, does not require bleaching. It may be observed, in passing, that there are in this country three or four sulphite cellulose mills which manufacture wood pulp by the sulphite process, and the waste liquors they produce are excessively polluting; but as these mills are so few in number at present, they need not be further considered here.

A large and clean water supply is essential for the making of white papers, sometimes as much as 200,000 gallons of water being used per ton of paper produced, where the water supply is abundant and the quality of paper made is a high-class one; as a general rule, however, the average volume of water used per ton of paper would be something like 50,000 gallons, and it is sometimes very considerably less than this in the case of low-grade papers and where water is scarce.

Several "white" mills, owing to pollution of the river from which they draw their water supply, are forced to purify the raw river water before it can be used, and in one particular instance the cost of so doing amounts to no less than £1,000 per annum.

The various processes and details of paper making are somewhat complicated, and methods and machinery differ in almost every mill, since the type of machinery and processes used depend largely upon the class of paper made; for example, the machinery of a "news" mill is designed to deal rapidly with wood pulp, but a mill turning out high-grade writing papers uses machinery designed to work at a lower speed, since long-fibred materials such as esparto grass and rags are used.

It is necessary to go into the various processes of paper-making at some length in order to grasp the many and varying difficulties with which a manufacturer may have to cope, and to realise that one particular branch of the trade may have problems to encounter that do not exist in another section of the trade.

It should be carefully borne in mind, when reading the paragraphs describing the actual making of the paper, that it is rarely the case that a precisely similar procedure is followed in any two mills, even when using the same raw materials and producing a similar class of paper.

It will probably be of most interest to give a brief description of the usual kind of operations employed for the manufacture of high-grade white papers.

Such a mill will employ mainly esparto* and rags, with possibly a little wood pulp, and the processes to which the materials are subjected are generally as follows, viz.: rags sorting, cutting; rags and esparto—dusting, boiling, pulping, making into paper, calendering, and cutting. The process of pulping comprises washing, breaking, bleaching, pressing and beating.

The rags are first of all sorted and cut (usually by hand in the case of note papers) into pieces about 3 in. to 4 in. square; in the case of lower-grade papers this operation is usually effected by machinery.

The cut rags now pass on to the machine known as the "willow," where the rags are tossed about in revolving drums containing iron spikes, the dirt being shaken out of the rags. After leaving the "willow" the rags are fed into the "duster," which consists of a revolving cylinder, covered with wire mesh, and provided internally with spikes, which toss the rags, freeing them from the dust, which falls through the cylinder meshes. The esparto grass duster is a machine resembling a combined willow and duster; rather large quantities of dust are produced from esparto, and this can be either burnt or mixed with the sludge resulting from the purification plant.

The next process consists in boiling the rags or grass fibre in "kiers"—*i.e.*, steel digester boilers—with a solution of alkali, to free the cellulose matter from dirt, grease, silica, gum, &c., and also to soften the fibres. Only about 45—55 per cent of the esparto can be utilised, the remainder being waste.

Both rotary and stationary boilers are used for rags, while stationary boilers are generally employed for esparto. The boilers are usually of sheet steel, and work under a pressure of some 45 lb. per square inch. Access doors are provided at the top and bottom of the boilers.

The esparto grass is placed in a kier at the same time as the alkali solution, or sometimes the soda is introduced in solid form, from 15—20 per cent of the weight of the grass being used; the top door is then shut and steam turned on for several hours, after which the alkali solution is run off—usually to a tank supplying the evaporator used for soda recovery—and hot water is run into the kier for washing purposes, this also being shortly afterwards run off to the evaporator. Esparto grass is usually boiled twice.

The kier liquors or "boilings" are excessively alkaline and polluting liquids, the first boiling being naturally much the stronger.

As a general rule, processes are in use at most mills for recovery of the soda from the boilings and first two wash liquors in the case of esparto grass, where, however, rags alone form the raw material, the boilings are rather dilute for profitable recovery. As much as 75 per cent or more of the soda is sometimes recovered, multiple-effect evaporators, such as the Porion or Yaryan, being used, and the residues incinerated.

The boiler, or kier, is next filled up with cold water, in which the grass stays until it is required, when the water is run off to waste, or else pumped up to an overhead tank, to be heated and used for the next batch of grass.

The kier liquors amount to some 3,000 to 4,000 gal-

* Esparto grass is a harsh, wiry grass, which comes chiefly from Algiers and Spain, being imported in bales. It closely resembles "marram" grass in appearance, a well-known grass growing on sand dunes and sandy soils by the sea.

lons of water per ton of esparto, and often less in the case of rags. It may be said at once with regard to these alkaline kier liquors that so far, no biological process is known which will deal with them efficiently and economically when they are too dilute to admit of profitable recovery. Being strongly alkaline they contain many solid matters in suspension and in solution, and give a high figure for oxygen absorbed.

On removal from the kier the fibre is washed, and then passed forward to the washing and beating engines, through which water is constantly passing, and it remains here until the washing process is completed and the kier drains are next opened up, after which it is known technically as "half-stuff." Very little colouring matter can be got in the foregoing process, and the amount of alkali as would be expected, is fairly high.

Bleaching is the next operation, effected by a solution of bleaching powder prepared in a special tank provided with mechanical agitators; from this tank the solution flows to a settling tank, where it remains for some hours, until the solution becomes quite clear. The bleach is then run into the washing [illegible] and the roll revolved. After the bleaching process has been in operation for some time a small quantity of sulphuric acid is added to assist the action. The bleach is finally run off and the fibre washed.

After bleaching is completed, there are several methods of dealing with the "half-stuff" before it passes to the beating engines, one of the principal of which is the direct system, or the ground pate; but in the direct system the fibre is run straight from the breaker to the beater. This machine resembles the breaker, but the roll is provided with additional bars, and rotates at a higher speed.

The beating process is complete in from three to ten hours, any colouring or loading materials—*e.g.*, china clay—being added in the beater.

After passing through the beater, the pulp is termed "stuff," and it is passed to the storage tanks or stuff-chests ready for the paper-making machine, termed the "Fourdrinier." From the stuff-chests the pulp is raised to a supply tank connected up to the mixing box, where water is added, and the pulp is passed over sand tables or strainers overlying a vat, the effect of this being to remove knots. The fine pulp passes from the vat to the paper-making machine.

This machine is rather elaborate; very briefly described, it consists of an endless band of woven wire cloth constantly travelling in the same direction in a horizontal plane, and supported by tube rollers at intervals. A lateral vibratory motion is given to the band as it travels along, which has the effect of interlacing and felting the fibres while they are floating in the water. The "stuff" from the [illegible] into a delivery box running the whole width of the band and is delivered [illegible] over the band is in contact with the rollers. This water (termed "machine" water) is caught in trays placed beneath the machine, and leading to a storage tank. Suction boxes are provided underneath the wire band at a point where the water has almost ceased to drain off at the tube rollers.

Large quantities of "machine" water are produced; it is frequently reused or also passed through "stuff catchers" or "save-alls," which are mechanical contrivances devised to retain the fibre or pulp while passing off the clear water.

The sheet of pulp now passes between "couch" rolls, where the actual manufacture of the paper terminates.

The remaining processes consist of pressing and drying, the continuous sheet of paper passing through two sets of rolls which express the water, and smooth first the top side and then the under side of the paper. The drying cylinders are supported in framing and are heated by steam, the heat gradually increasing as the finish of the process nears. "Felts" are used on most of the cylinders to keep the paper flat and to assist in conserving the heat.

After leaving the drying cylinders, the paper is surfaced by passing it through a stack of calendar rolls, after which the paper is wound upon rolls or drums, and the process is complete.

Turning to the waste liquors produced, the kier liquors, though comparatively small in volume, are always grossly polluting, and especially those derived from the boiling of esparto. The remaining waste waters comprise those resulting from the processes of washing, breaking and bleaching, together with the machine water and washings from various floors. These often contain colouring matter (at mills where coloured papers are made) with various "loadings," and the combined waste waters are consequently often highly coloured.

Concerning the kier liquors, it has been already mentioned that where a strong solution of soda is used—*e.g.*, for esparto grass—the boilings and first and second washings are almost invariably evaporated and incinerated for soda recovery, which is a process which pays; but it must be borne in mind that the cost of upkeep of the recovery plant is heavy, especially as regards the incinerator, and where a weak soda solution is used as in the case of rags—recovery apparently does not pay, and the kier liquor is usually mixed with waters from the other processes, the mixed wastes being run into settling tanks, a precipitant being sometimes added, while in some cases this is supplemented by straining through filters.

It is very advisable that when kier liquors are mingled with the rest of the water it should be [illegible] and not in [illegible].

It is of interest to note that the Rivers Pollution Commission, in their first report, point out that "the greater part of the alkaline liquor of the paper-maker might, with profit upon the operation, and certainly [illegible] the soda, even in the smallest mills, and under the most unfavourable conditions, and thereby relieve the river of this form of pollution."

It is not quite clear from the context whether the commission include dilute kier liquors in this statement.

The following figures of analysis, due to Mr. E. Halliwell, F.I.C., and taken from vol. iii. of the Seventh Report of the Sewage Disposal Commission, show the nature of the crude liquids before treatment derived from the manufacture of various kinds of [illegible]

	Solids.	[illegible]	[illegible]
[illegible]			
Do. do.			
[illegible]			
[illegible]			
[illegible]			
Crude liquors.			

It will be noted how extremely variable are the foregoing figures, and also that the main difficulty in treatment is likely to arise from the solids, both in suspension and in solution. Further, it must be remembered that paper mills discharge very large volumes of waste waters, 1,000,000 gallons and upwards per twenty-four hours being by no means uncommonly met with.

On the assumption that the strong kier liquors are treated for recovery, well-designed settling tanks, with facilities for employing chemicals, will effect a removal of a very large amount of the suspended solids together with a proportion of the solids in solution, and in most instances such a tank liquor, if not containing more than, say, 5 to 7 parts of suspended matter per 100,000, can be discharged to the river or stream without further treatment. A "brown" mill, however, would probably have difficulty in getting down to these figures, while for a mill using solely wood pulp they would be lenient. Unfortunately, in some cases space for tanks is virtually unobtainable. Alumino-ferric gives good results when a precipitant is needed, but in special cases careful straining through filters of fine material is called for in addition to tank treatment.

It is of distinct advantage if the various wastes can be stored before tank treatment, in order to equalise their varying strengths, characters and temperatures.

Tilmans recommends separate treatment of the various wastes, but in the case of many existing mills it would be a very costly and difficult business to alter the whole of the waste liquor drains in order to keep any special liquor apart from the general mixed wastes, with a view to special individual treatment. At one mill with which the writer is acquainted

the foundations rest upon solid rock, and the cost of redraining such a mill would be very heavy. In the case of a prospective mill the question of separating certain of the liquids—*e.g.*, separate treatment of the waste waters from the breakers and beaters, and also of the machine water—should receive careful consideration, and would probably enable the paper-maker to re-use the settled sludge or pulp.

Many paper mills already possess a very large tank capacity, but it is of little use having tanks unless these are properly attended to and regularly cleaned out, and this is where the shoe often pinches. Paper mills produce very large quantities of sludge, and there is often little enough room to spare for its reception after removal from the tanks. In the case of mills employing wood pulp, care is usually taken to save any pulp, either for re-use in the same mill, if clean, or for disposal to other mills producing papers of inferior grade. Frequently, when all the waste waters are mixed together, the sludge is pressed and tipped, or simply tipped in the semi-liquid state. Where practicable, well-drained lagoons assist very greatly in hastening the drying of the sludge, and the objections often applicable to lagooning sewage sludge do not apply so much here.

Some idea of the volumes of sludge produced annually may be gathered from an extract from the evidence of a witness examined by the Sewage Disposal Commission (Seventh Report, vol. iii.). Thus, Mr. J. H. Annandale stated that, in his own case, the waste products (from a small mill), consisting of solids from the machines—bleach, lime, and carbonate of lime from re-causticising the recovered soda—amounted to something like 3,500 cub. yds. per annum. The sludge, which contains a certain amount of lime, can be used as a manure, but it is sticky and difficult to manipulate.

The writer caused some experiments to be carried out with a view to utilising paper-mill sludge for raising heat. Esparto sludge was employed, and gave very promising results when carefully dried, but it was found that the moisture in the sludge, as with sewage sludge, militated against its employment as a fuel.

The main point in the treatment of waste waters from the majority of paper mills is ample tank capacity, well-designed tanks, and, most important of all, frequent attention for cleaning purposes, without which no system will give good results. The temptation to run tanks for too long periods is, of course, great, since it means less sludge production; but it is bad for the river which receives it. In many trades recovery of what were formerly regarded as wastes is becoming more general, and a manufacturer frequently finds nowadays that in the past he has been throwing away valuable material, the recovery of which not only often pays for the cost of recovery, but yields in addition a handsome profit.

Mr. Kershaw's next article will deal with the subject of tannery wastes.

American Road Congress.—The fourth American Road Congress held in Atlanta, Ga., recently, is claimed by the United States Press to have been the greatest good roads meeting ever held in any country in the world. The convention was held under the direction of the American Highway Association, the American Automobile Association, and many other national and state bodies. Mr. Logan Waller Page, president of the American Highway Association and director of the United States Office of Public Roads, pointed to the fact that during 1914 more than 18,000 miles of hard surfaced roads had been constructed in the United States—more than three-fourths the length of the entire national road system of France. He urged that greater efficiency be sought, and he believed it possible to save from the annual expenditure, now reaching more than £41,000,000 a year, at least 25 per cent, or £10,000,000, through efficient management.

A SHEFFIELD IMPROVEMENT.

LOWERING OF ROADWAY UNDER RAILWAY BRIDGE.

The accompanying photographic view illustrates an important piece of work at present in hand in Brightside-lane, Sheffield, under the supervision of Mr. W. J. Hadfield, the city surveyor.

It consists of lowering the roadway under the recently reconstructed Midland Railway Bridge, so as to give an increase of about 3 ft. 6 in. in the height from road level.

Brightside-lane is the direct route from the city to practically the whole of the east-end works, and hitherto great inconvenience has been caused owing to the fact that the limited headway has prevented anything larger than single-deck cars from being run under the railway bridges. There is a heavy workmen's traffic, and double-deck cars have been badly needed.

As the Midland Railway Company intended to reconstruct the bridge, arrangements were made with them to put in deeper foundations so as to permit the lowering of the roadway, and the work is now well in hand.

As the excavation was started only a few days ago, and the roadway was not closed until Monday, December 28th, the photograph will give some idea of the speed at which the work is being carried out. It will be noticed that one of the new tramway tracks is already laid for its whole length, and it is expected that the road will again be available for traffic within ten days of the date upon which it was closed.

BRIGHTSIDE-LANE, SHEFFIELD.

ENGINEERING DIFFICULTIES.

Numerous gas, water and other mains have had to be diverted, the goods yard of the Midland Railway Company has had to be lowered, and as this part of Sheffield is almost dead level, numerous questions affecting drainage have arisen. Special arrangements have been made to prevent flooding under the bridge, and, though it cannot be guaranteed that flooding will never occur during a deluge of rain, it is fully anticipated that any ordinary downpour can be dealt with by the means which have been provided.

The cost of lowering the roadway, relaying the tramways, and altering the various underground pipes will be from £2,500 to £3,000. There are other matters making up the whole cost of the scheme to the corporation to about £4,000, in addition to which the Midland Railway Company has paid for the necessary alterations to the bridge structure. In view of the fact, however, that the journey to Brightside per double-decked car will be shortened by half a mile, it is considered that the future saving, not only in running expenses, but also in journey time, amply justifies the expense.

Institute of Sanitary Engineers.

MR. A. P. I. COTTERELL'S PRESIDENTIAL ADDRESS.

At Caxton Hall Westminster on Wednesday [illegible] Institute of Sanitary Engineers [illegible] Mr. A. P. I. Cotterell [illegible] the chair [illegible] Mr. J. D. Watson [illegible] Mr. Cotterell [illegible] The day when the sanitary reformer was brushed aside as an impossible theorist is long past. Sanitation is now recognised as essential to the world's well-being [illegible] Man is a gregarious animal, and, whether in city or village [illegible] is she wherever civilisation spreads.

But if sanitary engineering has been recognised in peace, no less has it found its place in time of war. The experience of [illegible] death may be prevented by its aid. So much is this the case that [illegible] We are glad to know that one of our valued ex-presidents and many members of the institute are serving their country in this beneficent capacity. It is a satisfaction in these days of human slaughter—without precedent in history to realise that [illegible] important part, not in destruction, but in preventing or at least reducing some of the awful miseries of war.

Somebody has said that much of the trouble in which Europe is now involved is due to our bowing down to the "little god of progress." I suppose he meant that we have [illegible] by material rather than by moral progress. Still, in sanitary work there is no such distinction. Material improvement in this direction is immediately followed by moral gain. The provision of a public water supply or the drainage of a town may seem a prosaic piece of work, but these [illegible] a higher standard of cleanliness among the inhabitants, a widening of the social and moral outlook, and a confirmation of the axiom that "cleanliness is next to godliness."

WATER SUPPLY.

I should like briefly to review some of the progress made by sanitary engineering in our own land during the last four or five decades. There have been astonishing changes. Forty years ago few beside the larger towns had an adequate water supply and the conditions even in some of those left much to be desired. Now almost every town and many villages have their public water supply; the large towns, concurrently with an influx of population, have improved theirs out of recognition; lakes have been constructed or tapped to provide for the wants of densely populated cities, while many others are drawing far afield upon the resources of the country. London stands by herself. She has enormously increased her reservoir accommodation, and is engaged in still further extensions for the purpose of utilising to the full her [illegible] quality of the water.

[illegible] the front the value of the various sources of supply, [illegible] alive to the financial advantages of their position, and [illegible] royalty.

This greater demand for water and the comparatively limited number of pure sources of supply in a thickly populated country like England has of late years brought forward the question as to whether we are making the best use of them; whether, in fact, a water survey ought not to be undertaken. In my opinion such a survey is not only desirable, it is highly essential, and ought to be undertaken by some such central body as that proposed by the Royal Commission on Sewage Disposal. On it should be laid the duty of not only conserving the sources of supply, but of so regulating them that each shall be used to the best advantage.

SEWERAGE AND SEWAGE DISPOSAL.

In the department of sewerage and sewage disposal even greater advance has been made than in water supply. In one sense the art of sewage disposal may be said to have been created in the last forty years. I do not mean that before this period very little was known of the principles of sewage disposal, for I am one who holds that the past has much more to teach us than we are generally ready to admit. But there has been material advance with more and more confident step. Forty years ago only the larger towns [illegible] villages are provided. Then the disposal of sewage was at the best embryonic, except in a few enlightened instances; now we can design disposal works with practical certainty that they will fulfil the purpose intended if properly looked after.

As my predecessor pointed out last year, there is still much to be done in sewage disposal. In this brief survey I cannot attempt to go into detail, but I may refer to one or two directions in which work is being done and where more ground yet remains to be covered. One of them is in the elimination of smell. This, the bugbear of the sewage works manager, is often the protest of badly laid drains and sewers crying aloud for remedy. Various appliances have been introduced upon the sewers with the object of deodorising or destroying the offensive constituents of sewer gas, some of them distinctly ingenious in their character. The question of smell was dealt with in the Fifth Report of the Royal Commission on Sewage Disposal, but no satisfactory process can be said to have arisen as a consequence. The only one mentioned—viz., the introduction into the sewage of oxychloride—was so expensive as to make it prohibitive for any but extreme cases. Lately, however, efforts have been made to revive a practice advocated nearly thirty years ago of blowing air into the sewage. Mr. J. D. Watson, in a communication to the last congress of the Royal Sanitary Institute, recounts some experiments undertaken by him in this direction, which appear to promise a measure of success, the basis of the proposal being the saturation of the sewage by air blown in under pressure to prevent the formation of sulphuretted hydrogen gas.

It is in the utilisation of sludge that the greatest activity is at present being shown. After the disappointments and losses that have been the lot of investigators in years past, it is not surprising that a few years ago the search was almost given up, and every effort made to get rid of sludge in the quickest and cheapest possible way.

But "hope springs eternal in the human breast," and the very failure in a field that ought to be conquered has led others to renew the attack.

You remember that allegory of Olive Schiemer, where she depicts the hunter striving to climb the Mountain of Knowledge although the way gets steeper and steeper, and he knows that he must die before he reaches the summit; yet he is well content if he has built the steps up which another can gain still higher ground, while it may be that [illegible]

the bird he seeks will flutter down upon him at the end. Perhaps something of this spirit can be claimed for the humble sewage expert even though his efforts are only on behalf of such mundane stuff as sewage sludge.

Utilisation of Sewage Sludge.

The notable success of Bradford in transforming the greasy constituents of its sewage into a source of revenue has had an effect in drawing attention once more to this wasted source of national revenue. At Bradford, I understand, the recovery of fats produces so large an income that much of the annual upkeep of the works is thereby paid for, and the authorities go out of their way to encourage the introduction of trade wastes from the factories into the sewers.

Another scheme for the treatment of sewage sludge was described by my predecessor in this chair. It is in operation at Dublin and is, I understand, to be introduced shortly on a large scale at Birmingham. Mr. Watson described the process so fully in his address that I need not again particularise; suffice it to say that it consists of two main sections:—

(1) Fermentation of the crude sludge by the addition of yeast with separation of the resultant water, which in this case is drawn from underneath the thick [illegible] the fermentation.

(2) Drying the sludge after the incorporation of phosphates and potash, and its conversion into a fertiliser.

I have had occasion recently to examine professionally a method of sludge utilisation that is being worked by a company who have lately erected a plant at Wimbledon capable of dealing with 25 tons of sludge per day. This undertaking boldly sets out to recover the valuable constitutents of the sludge, and claims that effective uses can be found for all of them.

The sludge to be treated is first sprayed with petroleum; it is then distilled in retorts arranged in two series at increasing temperatures. Chemical changes are thus effected on the organic matter, oils, ammonia and gas being produced, while a carbonaceous residue is left in the retorts. The petroleum used is recovered with the sewage oil.

The promoters claim that a profit can be made from the sale of the resultant products—oil, pitch, ammonia [illegible]. The crux of the process lies in the use that can be made of the latter constituent. It is valuable in a number of manufactures varying from electrodes to printers' ink, and it may be used as a precipitant of the raw sewage itself.

By repeatedly precipitating raw sewage with the residue, and distilling the sludge cake, the phosphoric acid content is increased, so that after use, say, three or four times, a valuable manure is obtained.

Another feature claimed is that by such precipitation the effluent is so clarified that the work to be done in subsequent filtration is reduced.

Manchester Experiments.

Manchester has just brought to our notice still another process. It has several points of novelty in that it proposes so to perfect the preliminary or tank treatment of sewage as to do without filtration altogether.

The proposal is certainly interesting. By blowing air under pressure into sewage sludge, or, better still, into the slurry or humus obtained from filter and [illegible] an activated sludge is obtained containing a high percentage of nitrogen and capable, when mixed with raw sewage in the proportion of 1 to 4, of rapidly precipitating the latter, the whole contents being all the while subject to aëration from air blown in either through pipe tuyeres or through porous tiles. A plant has been installed at [illegible] gallons a day. [illegible] been [illegible] and one and a-half hours' settlement, the resultant effluent [illegible] described oxygen and nitrate tests, that no filtration whatever is required, but merely ponding before discharge.

One of the most interesting features is that the sludge, when thus oxidised, appears to be capable of acting upon sewage much in the same way as an aërobic filter. At the same time, by activation, the [illegible] grown, and the sludge is thus enriched to three times its former manurial [illegible] being used as a fertiliser after it has been reduced in bulk by drying.

I have [illegible] proposals to show the keen attention now being devoted to this phase of sewage disposal. All of them, it will be seen, aim more or less directly at restoring to the land some of the nitrogen that we are now so wastefully throwing into the sea, whence we only get a return, and that to a very limited degree, from the fish caught.

Royal Commission's Work.

It is needful to pass on; but before doing so, I ought not to omit mention of the notable work done by the Royal Commission on Sewage Disposal. They have been a long time about it, but they have certainly left their impress on the problem. Much of their work may have been merely to systematise existing methods, but their last report strikes out much more boldly in that it proposes to resume the discarded method of purification by dilution, and to introduce sewage into the streams in a more or less crude form, under scientific control, relying upon the previously ascertained oxygenating resources of the river to complete the purification. Although other countries less crowded than England may do this kind of thing, yet it seemed that here at any rate the door had not only been closed, but banged and bolted by legislation. If it is to be reopened, well-balanced discrimination will be needed to decide what shall and what shall not be allowed to pass through, and it confirms the need already mentioned of an efficient river authority.

Refuse Disposal.

I ought not to allow this portion of my subject to go by without drawing attention to the great advance that has taken place in the disposal of refuse. Those appalling heaps of rubbish that used to disgrace the thickly populated portions of our cities are not so numerous as they used to be. Dickens' golden dustman is becoming a being of the past. Any gain he may have made must have been at the loss of the community who supported him in stunted infant life and much disease. One of the finest sanitary developments of modern times has been the institution of the destructor. We have come back to the ancestral use of fire for the disposal of our refuse; may it be our fortune to see it extend to the disposal of our dead, and so revert to a practice in which our forefathers were wiser than we.

Sanitation and Health.

Dealing with the question of sanitation generally, the question has more than once been asked: Does it pay? The most direct reply is an examination of the death-rate, which has certainly fallen most remarkably. In 1871 to 1875 the annual death-rate of England and Wales was 22·0 per 1,000. In 1913 it was only 13·7 per 1,000. The drop in some of the principal epidemic diseases is very notable. In the period 1871 to 1880 the small-pox rate was 0·24 per 1,000; in 1913, it was 0·00 per 1,000. Scarlet fever has dropped from 0·71 to 0·06. Typhus has practically disappeared for some years, while enteric fever has come down from 0·32 to 0·04.

It has been shown, I believe from this chair, what a gain to the country in the money value of life these statistics indicate; but beyond this there is the increased efficiency of the population, a higher standard of health and of general well-being, all of which go to show that sanitation has been well worth the trouble and expense that has been devoted to it. In all this we, as sanitary engineers, may justly claim to have had our part, and may be proud that our life work lies in such a beneficent direction.

Housing.

And now I want to invite your attention and sympathy in a new direction. It is not easy, as you can well imagine, to find fresh material for an address when I have to follow so many able exponents of the art of sanitation, so I am going to break fresh ground, and propose to ask you to consider with me the problem of housing in so far as it affects the poorer classes of our people both in the city and in the country. I submit that it is a subject not only germane to the aims of the institute, but one in which we have a direct interest. We touch it as citizens, but we also come in contact with it in our profession. It will fall to the lot of many to assist in the solution of the problem, and just as we have had our part in improving the sanitation of the country in the past, so we ought also to find a place in the future in helping toward the provision of better houses for the people.

There is another way of looking at the subject. While we have been engaged in works of water supply

... and wider streets ... have ... proved ... more difficult to the small house-holder ... to the ... for ... [illegible] ... the ... [illegible] ... [illegible] ... [illegible] ... [illegible] ... than the rich.

... [illegible] ... [illegible] ... [illegible] ... [illegible]

Institution of Water Engineers.

WINTER GENERAL MEETING IN LONDON.

(Conclusion.)

The following discussion took place at the recent winter meeting of the Institution of Water Engineers on the presentation by Mr. Charles W. S. Oldham, borough waterworks engineer, of a paper reproduced in last week's issue—describing

THE WHITTON PUMPING STATION, IPSWICH CORPORATION WATERWORKS.

Mr. H. Ashton Hill (Birmingham) said the plant described was a very interesting example of pumping plant. It was a type of plant similar to one that he himself was considering for a client some two years ago. It was to deal with a capacity of 1,500,000 gallons a day, and the lift was about 300 ft. The water level was about 250 ft. down. He was advised by people who had experience of this sort of thing that they would not entertain the idea of going down to such a depth, and so he abandoned the scheme. He wanted to use electricity, as his clients were debarred from putting a steam engine on the land. He was sorry to have to abandon the idea, and it seemed to him the plant would have been very suitable for that particular case. In designing a pumping plant one engineer could never make two engines alike, as the conditions differed, and every case had to be considered on its merits. He could easily believe that the Ipswich installation was a very excellent one, although, of course, they took the risk of a rise in the price of oil. He did not know whether the author considered he had the cheapest installation in the country or not, but he (the speaker) thought he had as cheap a one as any. He had not got it, however, on the point of fuel, as he stated that fuel cost ·136d. per 1,000 gallons lifted 100 ft. He had pumped water on an actual working for twelve months at nearly half the cost of Mr. Oldham's. It would be interesting to hear the experience of the plant after two or three years' working. Where the author gained was, of course, in the low capital cost. In dealing with the cost of a pumping plant, fuel economy was one of the principal points, and the other was the interest on capital outlay. In the case of Ipswich they had a low capital outlay, and therefore the interest was low, while the fuel charges were comparatively high, and it was a case of balancing the two. The real test would be the result of the actual use of this machinery with a Diesel engine after a few years' working. With regard to the balancing of the pump, he would like to know how the very nice adjustment was made, and what would happen if the support in the pump body went away from its seating. There was no doubt that the Diesel oil engine had been much improved in recent years.

Mr. F. W. Davies (Nottingham) congratulated the author upon what he thought he might call a daring pumping plant. They had heard a great deal about these engines, but very few engineers had put them down at present, and he would be very interested to hear more about the plant after it had been running a few years. He noticed that only one engine was referred to, but that provision had been made for a second. It was usual for most engineers to put down two engines—one engine to be in duplicate with the other, or at any rate being held in reserve. He would like to know if any provision had been made for the contingency of the plant failing.

Mr. A. B. E. Blackburn (Sunderland) said it appeared to him, with a high-speed pump like the one described, there would be considerable wear and tear. Had the author taken any records of the quantity of slip on the pump? He would like to know by what method he obtained access to the pump or vertical shaft. It would be interesting also to have details of the guides for the pump rod, and to know whether the author had had any trouble with the couplings of the rods.

Mr. F. W. Hodson (Loughborough) said it seemed to him, with [illegible] ing 900 ft. [illegible], it would be dangerous to go to a much greater depth. There seemed to have been a somewhat considerable provision made for wear in the gearing top if it became necessary to put in special cooling apparatus for the oil. They were told that lubrication was by pumping through the thrust bearing and on to the gear wheels, whence it flowed back to the oil well, where it was cooled by water coils before being again pumped up. He was not quite clear as to all the details of that. The detail of the gear seemed to show ring lubrication on the main bearing of the shaft, but nothing was given of the pumping apparatus for the oil, and the cooling apparatus beyond it. He remembered hearing of the case of a gear of that nature in which the oil got so extremely hot that one could not bear one's hand on the casing. Under such circumstances it seemed to him there must be enormous wear.

Mr. H. C. Adams (London) said the pump was apparently supplied under a guaranteed fuel consumption, and after it was started the conditions were slightly varied, so that he had not been able to trace whether efficiency came up to the guaranteed figures or not. He gathered that the efficiency was a little bit on the safe side of the guaranteed figure. That led to another point, which was that the contractors were invited to tender for the type of pump they might consider suitable, and apparently there was no limit put on capital cost. They were told that the guaranteed fuel consumption of the plant adopted was one of the lowest, but seeing that with very expensive plants they could get much better efficiencies, perhaps that statement ought to be qualified.

Mr. C. H. Priestley (Cardiff) remarked that, with regard to the cost of construction of the works, the roads came out rather low, and he would also like to know what sort of cottage they could get for £250.

Mr. Davies said there was one point he omitted to touch upon. Personally, he was inclined to favour slow-running engines to fast ones; but there was no getting away from the fact that the slow-running engines had entailed great expense in the way of foundations and initial expense. He often thought, if it was his good fortune to put down another plant, he would consider putting down a slow-running engine in conjunction with a fast-running engine. Generally speaking, one was the reserve engine to the other. The fast-running engine might be reserved for emergency purposes, and although the economy might not be so great as the slow-running engine, one would be amply repaid by the lower initial costs.

Mr. Hodson asked if there was much vibration with the pump slung 100 ft. down the well.

The President (Mr. T. Molyneux) remarked that Mr. Oldham had invited them to see the plant, but it was not easy to get to Ipswich, and then down to London. At the same time, they were greatly indebted to him for the invitation.

Mr. Oldham, in reply, said he was not altogether in favour of putting the plant in, and he got it placed on record that he considered it somewhat too experimental for a public water supply. The committee, however, seeing there was a £2,000 saving on a £4,000 contract, considered they were justified in saving the town that money if they were not running too great a risk. The position of Ipswich also was that they had got another supply. At any rate, the plant was put in; it had been of very little trouble, and had worked with excellent results. He would say, in reply to Mr. Hill, that he would think electric driving was ideal for this class of borehole. He knew of a similar pump at Erith, in Kent, and there only wanted an engine-house 6 ft. square there. He could have done with a well half the size. On the question of economy, he might say that coal was dear at Ipswich, and cost him 21s. a ton. His pumping costs, with triple-expansion Worthington engines, working with coal, were 34s. per 1,000,000 gallons, with the same lift in the same reservoir, against all costs at Whitton of 25s. 7d. This was with oil £3 13s. a ton, delivered, and he hoped to get 10s. per ton off with his next purchase. Of course, there were no stand-by losses. A lot of things had to be taken into consideration with a Diesel engine, but if the efficiency was maintained, and it had been so far, then they would have to go a long way to beat it when coal cost 21s. a ton. When he was asked to contribute the paper

he found the engines he would prefer to wait to the thing had been in working some years, but he said it would be cheaper then. He would, however, be prepared to put the engines into the pump next year, because he thought they would be good watching. There was a question raised by the weight of the pump itself being partly taken up by the pump and partly by the shaft bearing. Messrs. Sulzer, the engineers, were pioneers in centrifugal pumping working, and had improved them of late years in a wonderful way. When the pump was actually running they would notice there was just a little play in the bottom of the bearing, and it was intended to put the pump on rubber. The foundations were laid by contract, and with regard to the cottage, it was not a bad one. They would probably put in a second set after two years' working, but, as they had another pumping station, they could afford to wait. There was not the least sign of any wear to speak of, and he was not frightened at all as to that. As to slip, he had a meter on the pump which was read daily and checked, and he did not find any decrease whatever. He still averaged about 1,550 gallons a minute at a speed of 350 revolutions. One extra revolution on an engine at that speed made every difference to a centrifugal pump; but there was no sign of slip at present. With regard to getting access to the pump, there were four girders across the well, and on the bottom set of girders there was a cast-iron base, carefully bolted down and levelled, which gave access to the pump. He knew of a similar pump which had been running two years as efficiently as when it was put down. He was afraid that there would have been a certain amount of slip with such a length and such a speed, but there was not the least sign of it. The great secret was the balancing of the pump. He thought 100 ft. would be about the limit. He had had no trouble with the couplings of the spindle. The shaft was guided for 8 ft. 6 in. There was no limit to capital cost, for the committee left that entirely open. They decided to have a Diesel engine, and left it open to the pump contractors, and they had all the best pump makers entering. He would be glad to show the pump to any member who cared to visit Ipswich.

Mr. ASHTON HILL pointed out that on the question of the cheapness of the installation he agreed that it should not go out that the plant was a very economical one for fuel.

Mr. H. C. HEAD (Winchester) said the price of coal at Ipswich was 21s. a ton. What was the price in South Staffordshire?

Mr. HILL said it would be about half the Ipswich price.

Mr. F. J. DIXON (Ashton-under-Lyne) said they were putting down Diesel engines in the heart of [illegible] than Mr. Oldham's.

A member remarked that they had an engine [illegible] at Biggleswade [illegible] nomically.

[illegible] WITH THE COMBINE.

The PRESIDENT said that [illegible] the institution who are serving in the Army and Navy [illegible] the institution and the hope that the institute will be able to welcome them back at their next meeting."

Mr. A. B. E. BLACKBURN (Sunderland) seconded the [illegible]

[illegible] OF THANKS.

The PRESIDENT proposed a vote of thanks to the Geological Society for the use of the apartments, to the scrutineers of the ballot, and to the authors of the papers.

Mr. C. CHEETHAM SMITH [illegible] the motion, and it was carried.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Are we not at present suffering from rather a surfeit of science in the papers which are read before various engineering societies? Shall we be expected to make elaborate calculations to find out what is the amount of "convex contact and resistance" which we are likely to encounter when we proceed to roll a short length of road? And must we, before we proceed to build a garden wall, carefully ascertain, by costly underground experiments and most elaborate formulæ and calculations, what will be the "lateral pressure and resistance of the soil and its supporting power"? Will an engineer's life be worth living if he is to take all these scientific precautions before acting?

* * * *

Apropos of scientific discovery is the following story a true one, and did it happen before or during the present war? A certain very learned German scientist informed his War Office that he had invented a wonderful sausage on which troops could be economically and well fed. The War Office ordered a ton, and sent them to a certain general for trial and report. After about a month the general sent the War Office the following laconic report: "As an article of food the sausages are a failure, but they make excellent tent-pegs when the ground is hard." What could the Kaiser have been about?

* * * *

Was "your contributor" misled the other day when he asked "if it is a fact that the Baltic timber trade is mainly controlled by Germans"? Is it true, as subsequently conveyed by a reliable source to "your contributor," that this statement is "absolute nonsense," as there is very little, if any, German money in the trade? Cannot some of your other contributors or correspondents give us their views on this subject so as to put your contributor right if he was wrong, or confirm the suggestion if he is right? Why is it sometimes that correspondents are so backward in coming forward?

Will not all surveyors be disappointed to hear that the Building Exhibition at Olympia will not be held this year after all on account of the war? Shall we not all miss the excellent opportunities that were given us in THE SURVEYOR Section of meeting each other and discussing professional questions, and still more the opportunity of examining the various exhibits and giving our orders in person? May we not hope that the exhibition is only postponed for one year, and that it will be held as usual in 1916?

* * * *

Will it be possible to "improve" the roads in Poland as well as those in the North of France and Flanders? Is it not proverbial that the roads in Poland are very bad at the best of times? And if this is so, can we possibly picture to ourselves their present condition? When will the military authorities decide to employ some expert civilian engineers to advise them on the repair of the roads at the Front?

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. P. T. Hargreaves, of Middleton, to whom the premium for December was awarded, has elected Prof. Jamieson's "Applied Mechanics and Mechanical Engineering," Vols. I. and II. (Griffin), and these books have been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:

445. Cement Testing.—Sketch and describe the apparatus necessary for conducting the bushel weight and specific gravity tests for Portland cement.

446. Materials. What is Mexican bitumen? Is it a natural product, like Trinidad Lake bitumen, or is it merely a trade term for a by-product of petroleum? If the former, what part of Mexico does it come from? (H. F. W., *Tottenham.*)

449. Roof Truss. Sketch a light iron roof truss for a span of 30 ft., and give enlarged details of the joints.

450. Masonry Dam.—The inner face of a masonry dam is a plane vertical surface 12 ft. in height. The section of the dam is a right-angled triangle, 9 ft. wide at the base, and the weight of the masonry is 125 lb. per cubic foot. When the reservoir is filled to the upper edge of the dam, find the point at which the resultant pressure intersects the base. (A.M.I.C.E.)

451. Hydraulics. Sketch a practical form of hydraulic ram for raising automatically to a considerable height a portion of any volume of water derived from a lesser height, and explain the points upon which satisfactory working depends.

REPLIES TO QUESTIONS.

447. Geodesy. Explain how the length of a measured base may be extended by triangulation. What is meant by a "base of verification"?

A measured base line may be extended by triangulation as follows. Let AB be the measured base that it is required to extend to C. Select two points, D and E, one on each side of AB, approximately at right angles to it from the point B, and each about equal to the length of AB distant from it.

FIG. 1.

In this case the length AB is known, and in the triangles ABD and ABE we get—

$$DB = \frac{AB \sin \angle DAB}{\sin \angle ADB}$$

$$\text{and } BE = \frac{AB \sin \angle BAE}{\sin \angle AEB}$$

Considering the triangle DBC we get—

$$BC = \frac{DB \sin \angle BDC}{\sin \angle DCB}$$

Again considering triangle BEC

$$BC = \frac{BE \sin \angle BEC}{\sin \angle BCE}$$

If all the measurements were absolutely correct, BC in each case would be equal. If they are not, the mean would be taken as the correct length. The above method would not be accurate enough for the main triangulation of a large survey, in

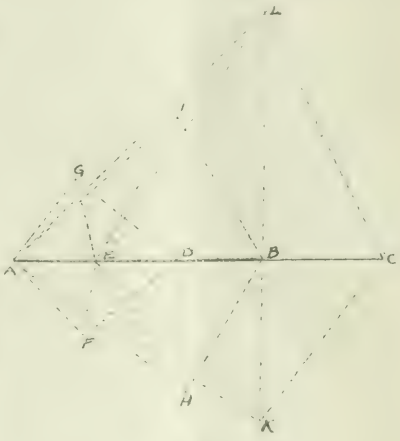

FIG. 2.

which case the line would be extended as follows: In Fig. 2, suppose AC to be the base line, of which AB has been measured, the points E and D having been fixed during the measurement. Select stations F and G so that the angles at E may be nearly right angles and the points themselves nearly equidistant from the line, and about equal to AE. The points H, I, K, L are similarly determined. Set up a theodolite at each of the stations and observe all angles. The length of BC can now be calculated as follows: (1) From AE and the observed angles calculate the length of EF and EG. (2) Calculate the length ED by means of triangles EDG and EDF, thus checking the length of ED as measured. (3) Calculate DB and DI in similar manner, using AD and ED as bases. (4) Calculate DK and DL, and again this checks the length as measured. (5) The length of BL and BK are next calculated, using AB and EB as bases. (6) Should the length of [illegible] taken from which the length BC is calculated, thus giving the required addition to the base line. A [illegible] of a triangle at a distant part of a survey that is measured in a similar manner to the original base from which the calculations were made. It is used to verify the accuracy of the calculations, and is probably the most severe test that can be applied to a [illegible] J. A. R., *Faversham.*)

Earthworks.

By G. BERTRAM HARTREE, F.S.I., Engineer and Surveyor to the Alton, Hants, Urban District Council.

It is not proposed in this article to attempt to teach the principles of defence or offence. It is presumed that the municipal surveyor may be called upon to carry out entrenching or similar work, for the military authorities, and the object of the contribution is to assist him in such work in the absence of detailed instructions from his military chiefs.

To the civilian mind the principles of fortification

Section.

Fig. 1.

may be likened to the snow enthusiast on snowballing. His first urge is to oppose his enemy on the spot, but later, more especially if he encounters a force of superior strength, a form of entrenchment appeals to him, and he finds a suitable wall from the shelter of which he can deliver a vigorous surprise attack, and at the same time have protection from the enemy's volleys. In the absence of a wall, he may

Fig. 2.

find a hedge or ditch that will give him sufficient screen, failing which, he can be imagined to have excavated a trench in the snow. We may take the alternatives: (*a*) His enemy knows his whereabouts and intends to attack him, (*b*) his foe may be unaware of his presence, but he is fully aware of the course the opponent will take. In the former event, nothing is to be gained by the lack of concealment being visible is no so great an objection, but in the latter case secrecy from view helps his attack considerably. In either event a ring of pitfalls will impede, if not actually prevent, his being borne down by superior numbers. To the methodical snowballer the possibility of flank and rear attacks will occur, and utilising boys' play to illustrate warfare, two other important factors in war must be included: (1) A well-aimed bullet would settle one opponent, and a secret shelter aids this considerably. (2) Artillery on the enemy's side will demolish the defenders' banks, and, if not killing him by shot or shrapnel, may [illegible]

Consequently it appears that in actual fight the soldier requires a screen from which he can deliver a [illegible] time will protect him from return attack. Assuming a soldier in the open, his only means of concealment [illegible] mound, instead of partial, he obtains nearer total [illegible] of a pick and shovel, he could in ten minutes construct an effective substitute, as shown in plan and section (Fig. 1), which illustrate a pit 6 ft. in length, 9 in. in depth, and 2 ft. 3 in. in width, with a further extension to the left to screen the legs, which, with a right-handed man, would lie in this direction. The excavated earth forms two adjoining mounds that leave a depression on which the rifle will rest.

Given sufficient time, more convenient and better [illegible] pits could be [illegible] as required. Fig. 2 illustrates the development of a small pit into one

Fig. 3.

larger and better protected. The space marked C is 2 ft. 6 in. in width, the same in length, and 18 in. in depth. With its excavated earth as shown shaded, cover would be provided for a man kneeling. As opportunity and time permitted the pit could be further developed as follows:—

Standing pit, 3 ft. deep, excavate E; for seat, excavate B. Standing room at rear, and kneeling space near mound, excavate A, B and D. The time taken in this work is governed by the nature of the soil, but an average may be taken as a half-hour for each quarter section measuring 2 ft. 6 in. by 2 ft. 6 in. by 1 ft. 6 in. Further protection may be obtained by loopholing, as shown in Fig. 3.

If available, logs, blocks, bricks, and so forth, would be useful for this work. Owing probably to the compact manner in which they can be transported, the military forces generally use bags which are filled with

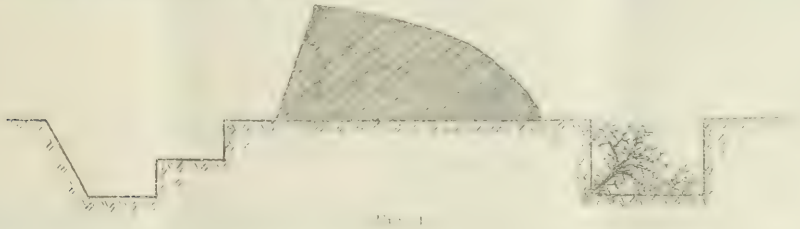

Fig. 4.

earth, and are more commonly known as sandbags. Two are laid longitudinally, with a space between for the rifle, and two laid transversely, with the earth above to give head cover.

By additional labour, adjoining pits can be connected up as trenches, and by further protection and improvements a breastwork, as shown in Fig. 4, will be developed. This is extended by throwing the mound forward, cutting a ditch on the enemy's side

That shown on sketch is 4 ft. 6in. in width and 3 ft. 6 in. in depth.

By the judicious use of thorns, bushes or spikes, preparations can be made so that, in the event of the enemy occupying the ditch, his stay would not be pleasant. The mound in sketch is 4 ft. 6 in. in height, with a batter of 1 ft. 6 in., and a total base about 9 ft. Behind is standing room 2 ft. 6 in. wide, with two 18-in. drops, and further widths of 2 ft. 6 in., and a batter of 18 in. at the rear.

During the present war the practice of making mounds in front of the entrenchments appears to have been discontinued, and it occurs to the civilian mind that the principal reasons for this must be necessity for concealment, with a reduced mark for

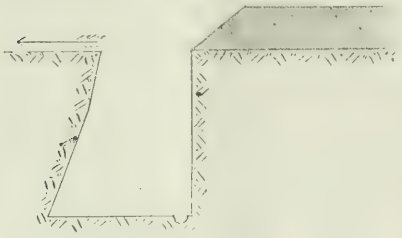

Fig. 5.

the enemy's fire. For better protection the trenches are tunnelled under wherever possible. Of course, the nature of the soil as to hardness, compact character, or otherwise, is of importance. All excavated earth is dressed down behind the trench to give from the enemy's side as little view as possible, and following two principles—shelter and concealment.

Fig. 5 shows a suggested type for a compact earth. Fig. 6 is an alternative arrangement, the choice, of course, probably being governed by local geological conditions. Fig. 7 shows the presumption that an existing hedge and ditch have been adopted as a shelter, and subsequently developed, and here there is the

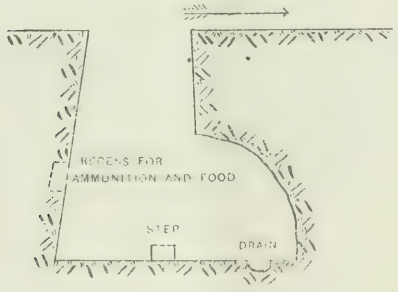

Fig. 6.

advantage that the newly turned earth is screened from the enemy's view. Fig. 8 is a suggestion, assuming the earth is of unstable nature, incapable of being undercut. Several military friends, however, tell me that, while the principle has much to recommend it, the main difficulty is the obtaining of the necessary timbers, and consequently it can be taken only on the presumption that such are at hand—and in such event, to the engineer actively engaged in sewer construction, many alternate and improved designs will occur.

Modern experience has proved the necessity of avoiding straight lines for trenches and adopting, according to topographical and other requirements, zig-zag, chevron-shaped, or a series of angles in planning trenches as shown in Fig. 9; in addition, the width is reduced so as to allow only of a man passing along, and insufficient to permit his passing another, except possibly at specially prepared points. Presumably the objection to straight and wide trenches is the fact that an enemy, by an enfilade movement, might sweep the whole of the defenders with a machine gun.

Where the configuration of ground does not permit natural cover for infantry in reserve, special shelters should be provided. Fig. 10 shows a simple form of shelter made by excavating and roofing over, either with close rows of timbers, spaced timbers with transverse rows of corrugated iron, hurdles, or any other material at hand, the whole being well covered by earth, finished off to present the smallest possible mark to the enemy. For covering guns, there are the alternatives of—(1) Constructing an epaulment or (2) sinking a gun-pit; local conditions decide which. If some form of natural shelter can be adapted, the former would probably be preferred, as, while the work of construction is in hand, the gun, if required, could be in its intended position and put into action; and there would probably be a further advantage in utilising an existing wall or bank, and so leaving the finished epaulment indistinguishable from the existing bank. With soft soil and no natural shelter, a pit would be provided, but in such case there would be no shelter whatever for the gun until the pit was finally completed.

Fig. 11 shows a typical plan that might be adopted for either. Of course, it is highly probable that local conditions and military necessities would require modification. The gun pit, as shown in the plan and section, could be constructed by five men in from one to two hours, according to the nature of the

Fig. 7.

ground. If available, a flooring of sleepers, laid transversely, would be very useful; failing which, flints would be of advantage.

Should the municipal engineer by any chance be left to his own initiative, the following points are recommended as worthy of consideration:—

(1) Arrange that your earthworks are in a position to make possible a sweeping fire, from which there is no natural protection, such as trees, hollows, or land configuration. (2) Avoid anything in the nature of a landmark, such as positions on the skyline, and works that give a different colouration to the surrounding ground surface. For example, on a brown-coloured soil, with a chalk subsoil, a very definite mark would be presented were the chalk exposed to

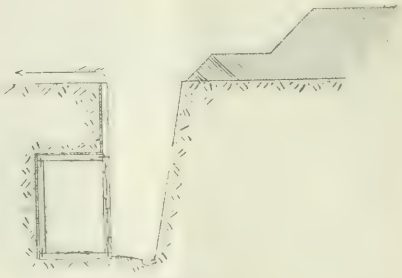

Fig. 8.

the surface. (3) Arrange for drainage of trenches. (4) Sand and light earths are better defence than plastic clays or hard earths. (5) Do not construct trenches immediately in front of elevations, particularly if of hard character. A sandbank would absorb bullets, and with a good batter might have no other objection; but a wall or hard rock is dangerous, as upon being struck by a shrapnel shell the contents of the latter would discharge on the rear of the defenders.

By use of obstacles, the defence can be greatly increased, and it is, of course, an advantage to use obstacles of such character that their removal by

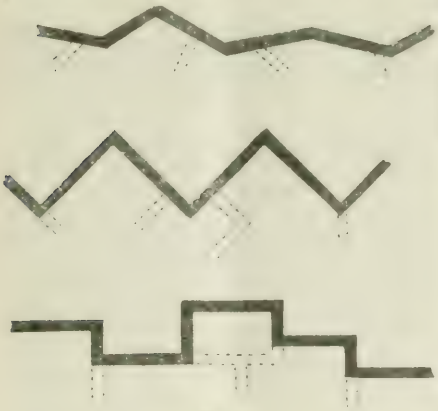

FIG 9.

Among obstacles mentioned in military manuals are [illegible] consisting of stakes pointed and driven [illegible] This is about the height of a man's knee, and as near [illegible] slope towards the attackers is made, and covered [illegible]

Ditches, if dug as obstacles, should be planned to prevent their adoption as trenches by the enemy, [illegible] the defenders' fire. Pointed brushwood or palisades [illegible]

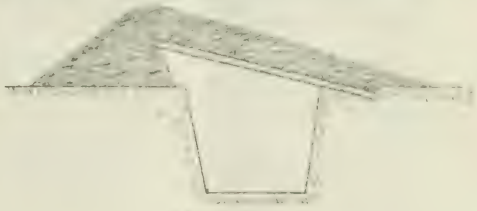

FIG 10.

latter the pointed form of galvanised iron sheeting [illegible] patterns, with any suitable tool, the edge of the plain form can be improved.

Screening is an important point in connection with this subject; but when endeavouring to conceal works care must be taken to avoid anything appearing unnatural and to expose the defence. [illegible] careful work was detected by the cut ends of the wood showing white. Had these been smeared with

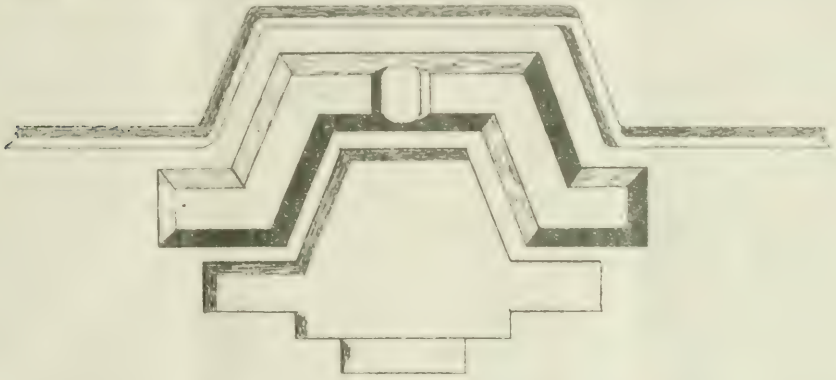

FIG. 11.

wires are attached, and run longitudinally, transversely and diagonally. The type more difficult to negotiate consists of posts the tops of which are breast high. The wires are taken from base of posts to the tops of those adjoining, and the whole arranged so that the attackers have the greatest difficulty in passing through, and at the same time are open to the fire of the defenders. Of course, barbed wire is the most suitable material for making [illegible] with the whole would have appeared to [illegible] impossible could be expected.

Waste Heat Boilers and Water Heaters.—All users of gas engines, oil engines and furnaces will be interested in a pamphlet just issued by the Bonecourt Waste Heat Boiler Company, Limited, Parliament Mansions, Victoria-street, S.W. The subject of the utilisation of the waste heat of the exhaust gases of

FIG. 12.

obstacles. Substitutes for the foregoing include pickets with sharp tops, brushwood or thorns, fixed with points towards the enemy.

The daily papers recently illustrated a further development of the pointed picket as used by the Austrians. These were fixed in small holes planned in lozenge shape, and further made difficult by the entanglements of wire on the surface.

In order further to screen such entanglements from the attackers, a glacis is erected on the enemy's side, from the earth that is thrown out of the holes.

internal combustion engines and industrial furnaces is one in which this firm have specialised, and they have designs of steam boilers and water heaters to meet the many different conditions of actual service. The space occupied by the Bonecourt Patent Waste Heat Boiler or Water Heater is extraordinarily small for the output, and to those of our readers who desire to obtain additional steam power, or a continuous supply of low-pressure steam or hot water without extra cost for fuel or attendance, we commend the pamphlet above referred to.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

WATER SUPPLY: "TRADE PURPOSES": RESTAURANT.—An important question under the Metropolitan Water Board (Charges) Act, 1907, was decided in *Oddenino* v. *Metropolitan Water Board* (Chancery Division, Mr. Justice Sargant, October 16th). The point in dispute was whether the plaintiff was entitled to a supply of water for domestic purposes at his restaurant in Regent-street at the domestic rate. The board relied on sec. 20 of the Act, which provides that they are not "bound to afford a supply of water otherwise than by measure to any house or building whereof any part is used for any trade or manufacturing purpose." On behalf of the plaintiff it was contended that the words "trade or manufacturing purpose" in this section should be construed in the same way as the courts had construed the words "any trade, manufacture, or business" in sec. 25. The last-mentioned section provides that the expression "domestic purposes" shall not include *inter alia* "any trade, manufacture, or business." In *Metropolitan Board* v. *Avery* (1914, A. C., 113) it was held that the test to be applied was not whether the water was consumed in the course of the trade, but whether the user of the water was in its nature domestic. Mr. Justice Sargant, however, after considering the relevant sections of the Act, came to the conclusion that sec. 20 was not governed by the above-mentioned case and other decisions given under sec. 25. He thought the test indicated by the words of sec. 20 was addressed to the character of the house, and not to the purposes to which the water was put. He therefore held that the board were not bound to give a supply to the plaintiff at his restaurant otherwise than by measure.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as XYZ, and words such as "engineer" and "surveyor," should never be used.

HIGHWAY ACTS: OBLIGATION OF ADJOINING OWNERS TO CROSS FOOTWAY.—"Gordon" writes: Has the owner of premises adjoining a public street the right to drive over a flag footpath without putting down a crossing? The proprietors of a local garage are utilising some adjoining premises for storing cars, and these are constantly passing and repassing over the footpath. I have asked them to put down a crossing, but they demur to do so. I cannot say that as yet they have broken any flags, but, of course this is quite possible and probable. To prevent the sudden jar at the edging they lay down a piece of wood in the channel. I am aware of Clause No. 18, Public Health Acts, Amendment Act of 1907, but I do not think this is compulsory upon the owner or tenant. I wish to know whether the authority can insist upon a crossing being laid down by the owner or tenant, or whether they can stop him going over the footpath, or generally what can be done in the matter.

The owner of premises adjoining a highway is entitled to cross to the highway at any point where his premises are in contact with it. In *Lyon* v. *St. Mary, Newington*, 1 Q.B.D., L.R., 5 Q.B., the vestry refused to allow the owner of a yard to make a crossing over the footway for carts, machinery, and from his premises. He therefore carted it across the footway in waggons, with the result that the pavement was smashed. It was held that he was *not* liable for wilful injury to the highway under sec. 72 of the Highway Act 1835. In the present case the positions are reversed, the council wanting a crossing and the owners refusing to make one. Although the owners cannot be compelled to put down a crossing if the council are willing to allow them to do so on reasonable conditions, and they refuse, they would probably be held liable for any injury they may cause to the footpath. Sec. 18 of the Act of 1907 is only in force in districts in which it is applied by the Local Government Board. In the opinion of the learned editors of "Lumley's Public Health Acts," the meaning of the section is not clear, and on its being applied in a district the question will arise whether it limits the owners' right of access.

ROAD REPAIR AGREEMENT.—"Anxious" writes: A road which has been repaired by the landowners here for the past five or six years has been attended to by my rural council, and put into a passable condition at the request of the agent to the landowner. While no money was contributed by the landlord towards putting the road into a safe condition, they promised my council to give from an adjacent quarry sufficient stone and gravel to pay for the cost that the council had gone to, but they still owe my council over £100 worth of stone, which cannot, however, be got as the quarry is almost worked out. An agreement was drawn up and duly signed by both parties (the council and the landlord) respecting the stone. Are my council in the position of giving up attending to the required repairs of this road, and the several fence stone walls that are now in need of repairs, through the arrangements come to, and through the past years' attention by the council's men, as the road was not taken over in the proper legal way?

It is impossible to answer this query without seeing the agreement or a true copy thereof. Sec. 148 of the Public Health Act, 1875, empowers an urban authority, by agreement with any person liable to repair any street or road, to take on themselves the maintenance, repair, cleansing or watering of any such street or road. It has been decided that this section enables an authority to agree with a person who is liable, *ratione tenura*, that, in consideration of a money payment, the authority shall take over in perpetuity the liability for such repair (*In re Earl of Stamford and Warrington, Ingram* v. *Gray* [No. 2], 1911, 1 Ch., 648). It seems clear therefore that under this section an urban authority may agree to take upon itself for ever the entire maintenance and repair of a *private* road without the formalities prescribed by the Highway Acts. Whether in the present case the agreement entered into has this effect, in view of the fact that the landowners have not carried out their part of the compact, is a question that must depend upon the terms of the document itself and its interpretation.

WATER-RATE: REDUCTION OF RATEABLE VALUE.—"O" writes: I shall be glad if you will give me a word of advice as to dealing with similar cases to the one specified below. A property is reduced in rateable value, and the altered assessment signed by the overseers in August, application having been made therefor in the April previous. The tenant of the property now claims a rebate from the water-rent for the half-year ended June 24th, and in addition declines to pay on the old assessment for the quarter ended September 29th. The local Act distinctly states that the rateable value in such premises as aforesaid shall be ascertained by the valuation list in force at the commencement of the quarter for which the rate accrues; if there is no such list in force, by the last rate made for the relief of the poor. My contention is that the consumer on the premises in question is liable to pay water-rate on the old assessment up to the end of the next succeeding quarter after the date of the altered assessment.

Assuming that the old Valuation List was in force on June 24th, the rateable value would, according to the local Act, be ascertained by that list for the quarter commencing on that date, as well as for previous quarters. Consequently the consumer would be liable to pay on the old assessment up to September 29th.

TENDERS FOR CONTRACT.—"Tender" writes: Tenders are invited by advertisement for the execution of a contract. Forms of tender, specification and quantities are supplied to persons tendering on payment of a deposit. When the tenders are sent in none of them is accepted, but the work is carried out by employed labour. The deposit was returned on the receipt of tender. Can those who submitted tenders claim the return of the tender and the priced quantities sent in, or either of them?

In my opinion a contractor who sends in a tender for the execution of works is not entitled to claim the return of the tender or of the priced quantities in the event of the tender not being accepted.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Beckenham U.D.C. (December 22nd. Mr. M. K. Nurse.)—£2,50[illegible] for the erection and equipment of [illegible] and Upper Elmers End Road. Also for the construction of the Crescent and Cromwell Avenue, and of private street improvements in St. [illegible] and the [illegible] of the cost thereof from frontagers and to Parliament. Details of the proposals were explained by the surveyor, Mr. J. A. Argent, who also produced and explained the plans on a model to the inquiry.

Burton T.C. (January 4th. Mr. E. G. Hobhouse.)—£30,000 for the [illegible] with the existing [illegible] Mr. J. B. Chapman acted for the [illegible] Mr. [illegible] explained the scheme and [illegible] time of the [illegible] the [illegible] the [illegible] the [illegible] without stopping [illegible] the [illegible] [illegible] [illegible]

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Bristol £7,704, Leeds £23,000, Newport £80,000; housing and town planning—Chester-le-Street, roads and materials—Birmingham, Easington, Wheadon; sewerage and sewage disposal—Irlam £16,000, Liverpool £31,000; water, gas and electricity—Birmingham.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Bristol T.C.—The council on Friday last agreed to a scheme for the extension of the infectious diseases hospital, at an estimated cost of £7,704.

Chard T.C.—The borough surveyor, Mr. E. W. Hearn, has been instructed to prepare plans for carrying out such portion of the scheme for the alteration and improvement of the municipal buildings as will cover the present necessary repairs, including the erection of new stage and dressing-rooms.

Halifax T.C.—The Markets Committee advise the corporation to purchase property in Market Hall-street, at a cost of £2,265, for the extension of the slaughter-houses.

Hexham R.D.C.—It has been resolved to proceed with a scheme for the erection of a hospital, at an estimated cost of £2,000. It was reported that a good supply of water could be obtained in the vicinity of the proposed building. A borehole had been put down on the site, and had yielded 360 gallons per hour. A sample of it had been analysed by Messrs. Bell & Riddle, and found very satisfactory.

Leeds T.C.—The Improvements Committee recommend that an arrangement be made with the Midland Railway Company whereby the corporation will pay to the company a sum not exceeding £7,200 towards the cost of the reconstruction and maintenance of the company's bridges over Wellington-road and Geldard-road in consideration of the company dedicating for street widening an approximate area of 149 sq. yds. of land, and reconstructing the bridges in such a manner as to permit of the widening of Wellington-road to 56 ft. and Geldard-road to 54 ft. 4 in. The council will also be asked to authorise the expenditure of £308 on carrying out street works in connection with the widening.

Leeds T.C.—A recommendation is made by the committee concerned for the extension of the meat market and slaughter-houses at Kirkgate, at an estimated cost of £23,000.

Malton U.D.C.—It was reported last week that the Pickering Urban and the Malton, Pickering, Helmsley, Kirbymoorside and Easingwold Rural Councils had agreed to combine with this council in providing an isolation hospital.

Manchester T.C.—The City Council on Wednesday approved the proceedings of a special sub-committee recommending the purchase of a plot of land at Chorlton-cum-Hardy for the erection thereon of public baths.

Newcastle-upon-Tyne T.C.—The extension of the infectious diseases hospital is under consideration.

Newport (Mon.) T.C.—The Parliamentary and [illegible] bridge should be built of ferro-concrete. The proposed structure will have a width of 70 ft. in three [illegible]

HOUSING AND TOWN PLANNING.

Chester-le-Street R.D.C.—The Local Government Board have sanctioned the necessary loan for the Harraton housing scheme, and tenders are to be obtained forthwith for the work.

Dublin T.C.—The City Housing Committee recommend the [illegible] Field," and the erection thereon of thirty houses.

Ormskirk U.D.C.—The surveyor, Mr. H. W. Chadwick, has prepared plans for working-class houses.

Pontypridd U.D.C.—For the purpose of a housing scheme it has been agreed to lease a site at Rhydfelin, opposite the houses already erected by the council, at 1½d. per square yard; also land at Fairfield, subject to the price being the same. The number of houses to be erected will be decided later.

Trim R.D.C.—At a recent meeting of the council a resolution was passed to adopt the Labourers' (Housing) Act, and to rescind the resolution to the contrary.

Wincanton R.D.C.—Official sanction has been given to the housing scheme for Bruton.

PARKS AND OPEN SPACES.

Birkenhead T.C. The town council are recommended by the Health Committee to purchase land at Rock Ferry, at a cost of £1,408, for a recreation ground.

Erith U.D.C.—The surveyor, Mr. H. Hind, has been instructed to prepare plans for two tennis courts in the recreation ground.

REFUSE COLLECTION AND DISPOSAL.

Godstone R.D.C.—The recommendation of the Highways Committee to purchase six carts for scavenging purposes has been agreed to.

ROADS AND MATERIALS.

Andover R.D.C.—The surveyor, Mr. J. Wormald, has received instructions to repair certain roads near Tidworth upon the requisition of the military authorities, who will bear the cost.

Axholme R.D.C.—The proposal to widen the roads of only 9 ft. or 10 ft. wide throughout the district came before the council at a recent meeting. The surveyor, Mr. B. West, presented a list of these roads, and said he estimated that the cost of adding 3 ft. to the width, where practicable, would be about £120 per mile. Of equal importance would be the alteration of some of the narrow right-angle, and often "blind," corners, which existed on several of the through roads in the district. It was agreed to consider the matter further a month before the meeting at which the yearly estimates will be submitted.

Birmingham T.C.—The council on Tuesday passed a resolution authorising the Tramways Committee to purchase lands on the Bristol-road tramway route, at an estimated cost of £41,958, for the purpose of widenings. The Finance Committee were also authorised, subject to the approval of the Board of Trade, to borrow £42,000, the balance of the cost of constructing the tramway in Pershore-road as a double line, after providing £26,000 from the tramways reserve fund.

Bognor U.D.C.—A scheme for the widening of the marine road west of the pier is to be carried out under the auspices of the Central (Unemployed) Body, at an estimated cost of £9,000.

Broadstairs U.D.C.—The surveyor, Mr. H. Hurd, has received instructions to report as to the advisability of carrying out repairs in Kingsgate-avenue.

Derby T.C.—It is proposed to purchase property in Cheapside, at a cost of £4,300, for the purpose of an improvement scheme.

Dudley T.C.—The Public Works Committee, in a report issued last week, state that, having given further consideration to the proposals for the construction of a new road between Wolverhampton and Birmingham, they recommend that, as the scheme would not in any way benefit the town of Dudley, the Association of Midland Local Authorities be informed that the council did not support it.

Earby U.D.C.—The West Riding County Council have intimated to the urban council that they will bear the cost of the proposed main road improvement at Wysick Hill bottom.

Easington R.D.C.—The council have agreed to increase to £20,000 their contribution towards the cost of the proposed coast road, on the condition that the Road Board makes a contribution of £30,000. It is understood that the other authorities concerned, the county council and the West Hartlepool Corporation, will also contribute £20,000 each.

Godstone R.D.C.—The tender of the Taroads Syndicate has been accepted for tar-washing the roads in the ensuing year.

Halifax T.C.—Widening schemes at Bull Green and King Cross-street are to be carried out under the

direction of the borough engineer, Mr. J. Lord, at an estimated cost of £3,200.

Hendon U.D.C.—The council have approved the estimate of the surveyor, Mr. S. S. Grimley, at £1,704 for making up Lovelace Place.

Ilford U.D.C.—It has been decided to make up Uphall road under the Private Street Works Act.

Lancaster T.C.—Plans have been passed for making up Church avenue and Chatsworth road.

Leicester T.C.—The council on Tuesday voted a contribution of £400 to a fund for the improvement of Victoria Park, as a thanksgiving for the conclusion of peace. (See Barrow Rural District Council).

Moira R.D.C.—The council have approved the proposals of the county surveyor, Mr. James Heron, for doing the road work by direct labour. The estimated yearly saving under the scheme is £252. The wages of the surfacemen are to be raised from 12s. to 14s. a week.

Romford R.D.C.—The tender of Mr. F. W. Moss, Romford, at £2,256, has been accepted for new street works.

Somerset C.C.—Negotiations are in progress in regard to the land required for the proposed widening of Bristol Hill, Bridgwater.

Willesden U.D.C.—Certain road widenings and works of sewerage, estimated to cost £7,000, have been approved by the council.

SEWERAGE AND SEWAGE DISPOSAL.

Alcester R.D.C.—A scheme is under consideration for sewerage works at Great Alne, which are estimated to cost £300.

Berkhampstead R.D.C.—A sewage disposal scheme is to be carried out at Long Marston, at an estimated cost of £300.

Godstone R.D.C.—The tender of Messrs. Head Bros., at £94, has been accepted for the construction of a sewer at the outfall works.

Guiseley U.D.C.—The West Riding Rivers Board have written to the urban council giving two months' notice of their intention to take proceedings against them in respect of a stream contaminated in places by sewage.

Irlam U.D.C.—It has been resolved to carry out extensions at the sewage disposal works at an estimated cost of £10,000.

Liverpool T.C.—It has been decided to construct a new main sewer across the dock estate at an estimated cost of £31,000.

Manchester T.C.—After an inspection of the completed work of a section of the main drainage scheme begun three years ago, a meeting was held of the Rivers Committee and members of the Withington Committee at which speeches were made with respect to the sewerage of the city. The chairman of the Rivers Committee, Mr. Froude, said it was three years ago last month that the committee got the approval of Parliament to make these new sewers. They had since done a magnificent work, a work which would help to make Manchester one of the best-drained and healthiest cities in the world. The total length of sewers finished amounted to about 17 miles, and the total amount of contracts let to date was about £614,000. The size of the sewers varied in diameter from 15 ft. 3 in. to 2 ft. 6 in. Mr. Froude complimented the contractors (Messrs. Griffiths & Co., Westminster) upon the excellence of their work; he had never seen a better piece of work than that which the committee had been inspecting. As for the city surveyor (Mr. T. de Courcy Meade), it was a monument to him that would do him credit among generations yet to come. Councillor West (deputy chairman) said the city surveyor had always advised the committee to have only the best materials, and they had always supported Mr. Meade in that matter. The cost of the section of the work inspected was £48,399.

Nottingham T.C.—The Health Committee report that the work of converting pail-closets into water-closets had been carried out continuously since the council had given authority for inclusion in the committee's estimates of an annual sum to enable them to subsidise owners who voluntarily carried out the conversions. In addition to pail-closets, however, there are a considerable number of waste-water closets in the city which were constructed some years since as a half-way step between pail-closets and water-closets. Such closets, although then considered an improvement on pail-closets, have never been satisfactory, and often get out of order and become very insanitary, resulting in much trouble and nuisance. The committee recommend that the council should authorise them to pay to owners of all waste-water closets who voluntarily convert them into water-closets a similar subsidy to that paid in respect of the conversion of pail-closets.

Paignton U.D.C.—The tender of Mr. A. E. Brock, at £512, has been accepted for sewerage works.

Trowbridge U.D.C.—The surveyor, Mr. H. Lailey, recently submitted to the Building and Sewage Disposal Committee a new type of pipe joint which he had designed, and which he considered would be advantageous for sludge and sludge-water drains, inasmuch as if the drains were required to be diverted or moved at any time the diversion or removal could be accomplished without damage to any of the pipes. The committee inspected samples of the pipes, and were of opinion that the use of them would be a great advantage in carrying out the work and an improvement upon the pipes originally specified. They therefore authorised the use of this special type of pipe for the purpose, the surveyor having offered his design free, without any royalty or benefit to himself, direct or indirect. The action of the committee was confirmed by the council.

Wakefield R.D.C.—Drainage works estimated to cost £220 have been approved.

WATER, GAS, AND ELECTRICITY.

Ballymena U.D.C.—The council have adopted a scheme prepared by Messrs. Sawley & Corrance, of Belfast, for a new water main from Queen Street, recommend that the pipe should be an 8-in. one instead of 7-in., as proposed.

Belper R.D.C.—The surveyor, Mr. R. C. Cordon, has in hand a scheme for water supply for Alfreton, which will probably be submitted to the next meeting of the council.

Birmingham T.C.—The council on Tuesday last authorised the Baths and Electric Supply Committee to proceed with the erection and equipment of a temporary electric supply station at Nechells, at an estimated cost of £97,300, for the purpose of supplying a large new demand, including a certain proportion created by the Government's requirements [illegible]

Castletown R.D.C.—The council have adopted a scheme for the improvement of the water supply, at an estimated cost of £1,200.

Paul (Cornwall) U.D.C.—Consideration is being given to alternative schemes for an improved water supply.

Wellington U.D.C.—The engineer and surveyor, Mr. G. Riley, has received instructions to prepare plans and specifications for sinking a second borehole, with a view to obtaining an additional supply of water.

Ystradgynlais R.D.C.—The council have agreed to purchase the Glantawe electric supply works for the sum of £17,000.

MISCELLANEOUS.

Trowbridge U.D.C.—The chairman, the Rev. H. Sanders, at the recent council meeting, said that some little time ago, when it was decided to put the troops into disused factories, their surveyor, Mr. H. Lailey, was asked if he would be good enough to prepare plans to help the work forward, which he did, to the satisfaction of the military authorities. The cheque paid for the plans Mr. Lailey had handed to him, telling him he might do as he liked with it. He could assure him that it should be put to some useful purpose—not for himself. They were very much obliged for the gift.

Twickenham U.D.C.—It has been decided to purchase for £118 a second-hand dumb barge fitted up for the use of bathers of both sexes at all times of the day, subject to their wearing regulation bathing costumes.

Society of Architects.—The annual meeting of this society will be held on Thursday next at 7.30 p.m.

Waterproofing of Cement.—We understand that, in the specification for the Bilton schools, the use of Pudlo has been specified for impregnating the cement.

Water Supply at Wath-upon-Dearne.—The extensions of the Wath-upon-Dearne waterworks have been completed at a cost of £12,000. The scheme, by which the capacity of the reservoirs has been increased to 900,000 gallons, was carried out under the direction of the surveyor, Mr. J. H. Drew.

PERSONAL.

Mr. Thomas Colbert, Dunbar, has been appointed burgh surveyor of Oban.

Mr. Swarbrick, deputy borough surveyor of Swansea, has been voted £100 for extra services.

Mr. John Robertson, surveyor to the Darlington Rural District Council, has resigned his appointment, after a service extending over nineteen years.

Mr. J. Thorpe, surveyor to the Market Bosworth Rural District Council, has been appointed temporary assistant to the Ashby Rural District Council.

Mr. A. H. Waller, formerly deputy town engineer of Durban, has been appointed to the post of town engineer of Bulawayo for a period of twelve months, subject to three months' notice. The salary is £800 a year. Mr. Waller assumed his new duties on the 16th ult.

Mr. Thomas Colbert, road surveyor for the Western District of the county of Haddington, died, we regret to state, on Friday after a brief illness. A little over thirty years ago Mr. Callen was appointed assistant surveyor for East Lothian, under the late Mr. John Nelson. On the latter's death Mr. Callen was given full charge of the Western District roads.

Mr. T. W. M'Cullough, chief waterworks engineer of the city of Belfast, was unanimously elected president of the Institution of Water Engineers for the year 1915-16 at the winter meeting of that body held in the Geological Society's Rooms, Piccadilly, London, on Friday, the 11th ult. The new president is a native of Belfast, and has had a long and extensive practice as a waterworks engineer in nearly every province in Ireland, having been concerned in the design and construction of many provincial waterworks undertakings, but more particularly responsible for the design and construction of the several extensive reservoirs, filters, conduits, tunnels, and the other contingent works in connection with the water supply for Belfast, where, for the past eighteen years, he has been the chief waterworks engineer, and is now engaged in the preparation of the contract plans and specifications for the immediate construction of the extensive "Silent Valley" storage reservoir, to hold 3,000 million gallons, in the Mourne Mountains, some 45 miles due south of the city. In earlier years he was also responsible for the design and construction of several sewerage, harbour and railway undertakings in Ireland, and is the author of the first scheme for an Irish Channel tunnel, between the Co. Antrim coast in Ireland and the Wigtownshire coast in Scotland. He has been a member of the Institution of Water Engineers since its formation and was elected in 1889 a corporate member of the Institution of Civil Engineers, and for several years past has been a Justice of the Peace for the city of Belfast.

The late Mr. William B. Bryan, M.INST.C.E., chief engineer to the Metropolitan Water Board, left property valued at £49,873.

CORRESPONDENCE.

[illegible]

PROFESSIONAL MEN AND THE WAR.

To the Editors of THE SURVEYOR.

Sir,—I should be glad if you would kindly allow me space in your paper to bring to the notice of your readers the [illegible] of the Technical Civil Service Bureau.

Since the war started we have successfully worked [illegible] the Royal Engineers, and Army Service Corps, and the "Artists."

We are now in a position to advise men about all branches of the Service, and to help them to enlist where they would be most useful.

Skilled men [illegible] are urgently required at Headquarters, and I shall be glad to advise all applicants if they will communicate with me, or call at 18 Tufton-street, S.W.—Yours, &c.,

ALAN PATRIC,
Hon. Recruiting Officer.

18 Tufton-street, Westminster, S.W.
January 1, 1915.

PRO PATRIA.

[SEVENTEENTH LIST.]

We present herewith the seventeenth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Cole, A. V., engineering assistant, Nelson Corporation, R.A.M.C.

Crowther, A. H., junior clerk, borough surveyor's department, Nelson, R.A.M.C.

Holt, J. [illegible], pupil, borough surveyor's department, Nelson, R.A.M.C.

Smethurst, E. S., architectural assistant, Nelson Corporation, R.A.M.C.

From the various departments of the Salford Corporation 708 men have joined the military and 15 men the naval forces since the war began.

The Cardiff city engineer's office staff and workmen, as a result of their weekly collections, contributed £11 12s. 3d. to the Prince of Wales' Fund during the months of November and December. The amount previously contributed was £124 3s. 10d., making a total up to the end of the year of £240 16s. 1d.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CAERPHILLY URBAN DISTRICT COUNCIL.

SURVEYOR'S ASSISTANT.

Applications are invited for the appointment of Assistant in the Surveyor's Department of the above Council.

Applicants must be good draughtsmen, and accurate surveyors and levellers, experienced in Private Street Works and the general routine of a Surveyor's Department of an Urban District Council. Architectural experience will be considered a qualification.

Salary £80 per annum, rising by annual increments of £5 to £100 per annum.

Applications, stating age and qualifications, accompanied by copies of three recent testimonials, and endorsed "Surveyor's Assistant," must be addressed to the Chairman of the Finance Committee, and delivered at the Council Offices, Caerphilly, not later than Monday, 18th January, 1915.

(By order)
ALFRED O. HARPUR,
Surveyor.

(2,233)

AN ARCHITECTURAL DRAUGHTSMAN required (near London), temporarily.—Apply, [illegible] qualifications, to Box 1,501, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,238)

BECKENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The Beckenham Urban District Council invite Tenders for the [illegible] of stream between Croham-road and Harper's Roads, and also the reconstruction of a culvert under Cedars Road.

The works include some 270 cub. yds. of cement concrete, and 400 cub. yds. of excavation.

Plans and Sections may be seen, and Bills of Quantities, Specifications and Forms of Tender obtained, on application to Mr. John A. Angell, Surveyor, on and after January 11th, on the production of a receipt from the Collector for a deposit of £1, which will be returned on the receipt of a *bonâ-fide* Tender.

A clause will be inserted in the Contract providing that the Contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, not [illegible] to the extent of 75 per cent. at least of the staff required in the execution of such works, give preference to and engage such competent workmen of the class required as may be *bonâ-fide* residents in the Parish of Beckenham, and may offer themselves for employment.

Tenders, duly sealed and endorsed "Tenders for Culverts," to reach undersigned not later than 4 p.m., Monday, January 25, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
F. STEVENS,
Clerk of the Council.

[illegible] 1915. (2,235)

BECKENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS

The Beckenham Urban District Council invite Tenders for the making up of St. George's-road, Beckenham. The works comprise the excavation and laying of about 900 lin. yds. granite kerb and channelling, 300 sq. yds. of tarmac, 200 cub. yds. metal for 700 sup. yds. of footpaths, and other incidental works.

Plans and Sections may be seen, and Bills of Quantities, Specification and Forms of Tender obtained on application to Mr. [illegible] Surveyor, on and after January 11th, on the production of a receipt from the Collector for a deposit of £2 which will be returned on the receipt of a *bonâ-fide* Tender.

A clause will be inserted in the Contract providing that the Contractor shall (1) pay to the employes the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, and (2) to the extent of 75 per cent at least of the staff required in the execution of such works, give preference to and engage such competent [illegible] of the class required as may be found [illegible] residents in the Parish of Beckenham, and may offer themselves for employment.

Payment under the Contract will not be made until six months after the completion of the works.

Tenders, duly sealed and endorsed "Tenders for Street Works," addressed to the undersigned, must be delivered not later than 4 p.m., Monday, January 25, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

F. STEVENS,
Clerk of the Council.

January 6, 1915. (2,250)

RURAL DISTRICT COUNCIL OF CLUTTON

TAR

The Rural District Council of Clutton invite Tenders for about ten thousand gallons of Coal Tar, complying in every respect with Road Board's Specification No. 5, Specification for Tar No. 2.

The Tar to be delivered in full truck-loads, and in sound and good barrels, carriage paid, at Hallatrow or Pensford Station, in such quantities and at such times as required by the Council's Surveyor.

All Tar to be delivered between the 31st March and 1st July, 1915.

The barrels will be returned to the Contractor, carriage paid, but the Council will accept no liability for damage thereto, and will make no payment in respect thereof.

The decision of the Council's Surveyor as to the quality of the Tar, and all other matters arising out of this advertisement, to be final and binding.

Tenders to reach the undersigned on or before 26th instant.

By order,

J. SUMNER DRURY,
Clerk to the Council.

Temple Cloud,
Bristol.
January 7, 1915. (2,257)

BOROUGH OF CHELTENHAM

YEARLY TENDERS

Tenders are invited for the supply of the [illegible] for the year ending 31st March, 1916: Portland Cement, Forage, Stoneware Pipes, Broken Stone, Disinfectants, Oils, Colours, &c., Ironmongery (including wrought-iron Tree Guards), Timber (including Wheelbarrows and Street Orderly Trucks), Indiarubber Goods, Lead (Sheet, Pig, Pipe and Tape), and Brass Fittings, Tools for Highways, &c., Wrought Iron, Steel, Files, &c.; Electric Light Fittings, Household Goods, Sundries, &c. (including Cotton Waste, Bathing Drawers, Towels, Road Brooms, &c.); Lias Lime, Bricks, &c.; Clothing (including Uniforms, Flannel Suits, Waterproofs, Overalls, &c.).

Forms of Tender may be obtained from the undersigned, to whom sealed and endorsed Tenders are to be delivered not later than the 30th January, 1915. The lowest or any Tender will not necessarily be accepted.

J. S. PICKERING,
Borough Engineer.

Municipal Offices, Cheltenham.
January 6, 1915. (2,236)

SOME RECENT PUBLICATIONS.*

ARCHITECTS' AND SURVEYORS' DIARY. [illegible] Limited.

We have received [illegible] Surveyors' Diary" for 1915, and the publishers are [illegible] tion. It contains over 400 pages of information on all subjects of interest to surveyors, and there is an [illegible] year's work.

Manufacture of Concrete Paving Slabs.—Mr. W. White Cooper, engineer and surveyor to the Slough Urban District Council, will be glad to have the names and addresses of firms who make machines [illegible] clinker.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 1.30 P.M. ON TUESDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, [illegible] THE SURVEYOR, [illegible] WESTMINSTER. [illegible] *only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH ENGINEER AND SURVEYOR, AND WATER ENGINEER. [illegible]

BURGH ENGINEER.—January 9th.—Corporation [illegible] clerk.

ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH OF GUILDFORD.

GENERAL FOREMAN.

The Corporation require the services of an experienced general foreman. Candidates must have a thorough and practical knowledge of modern road construction and maintenance, including tar-macadam, granite, wood and gravel roads, paving of footpaths, street scavenging, house refuse collection, sewerage, and all other duties which generally appertain to the office.

He must be thoroughly experienced in the supervision and organisation of manual and team labour, and be able to ride a cycle.

The person appointed will have charge of the outdoor staff of the Corporation under the direction and [illegible] of the Borough Surveyor.

Wages [illegible] per week, with house and cycle provided by the Corporation.

Applications in candidate's own handwriting, stating age, present and past employment, accompanied by copies of three recent testimonials, to be sent to the undersigned, endorsed "Foreman," on or before Thursday, the 21st January, 1915. Canvassing will [illegible].

A. D. JENKINS,
Town Clerk.

Town Clerk's Office,
Guildford.
January 5, 1915. (2,230)

PORT-OF-SPAIN CITY COUNCIL.

The Council invite applications for the combined posts of City Engineer and Engineer of the Port-of-Spain Water and Sewerage Works.

2. The salary attached to the post of City Engineer is £1,000 a year, and to that of Engineer of Water and Sewerage Works, £500 a year with travelling allowance at the rate of £75 a year.

3. The intention of the Council being that the two posts of "City Engineer" and "Engineer of Water and Sewerage Works" should be held by the same person, every application must be for the two posts combined.

4. The offices are pensionable under the Port-of-Spain Corporation Ordinance, 1914.

5. The appointment, so far as concerns the post of Engineer of Water and Sewerage Works, is subject to the approval of the Governor.

6. Candidates must be corporate members of the Institution of Civil Engineers of England, and must possess experience in the design, construction, and maintenance of waterworks and sewerage systems.

7. Applications, accompanied by not less than three recent testimonials, and stating age and previous experience, must be supported by satisfactory evidence that the candidates possess the qualifications set forth in the preceding paragraph of this notice, and must be forwarded so as to reach the undersigned *not later than the 31st January, 1915.*

8. Candidates must also forward with their applications a medical certificate of fitness for service in the West Indies.

9. The successful candidate will be required to furnish a bond with an approved surety in the sum of £500 for the due performance of the duties of the above offices. He will be required to devote his whole time to the service of the Corporation, and to reside in the City of Port-of-Spain, or within one mile of the limits thereof, and he must be prepared to enter upon the duties of the appointment within one month from the date of the receipt by him of the official notice of his appointment.

JOSEPH ARNOLD LAMY,
Town Clerk.

Town Hall,
Port-of-Spain,
Trinidad, B.W.I. (2,195)

RURAL DISTRICT OF WILLITON
DISTRICT SURVEYOR.

The Williton Rural District Council invite applications for the post of District Highway Surveyor for the Western portion of their District, at a salary of £150 per annum, with an allowance of £40 per annum for motor locomotion which the person appointed will have to provide.

Further particulars can be obtained on application to the undersigned.

Applications, stating age, qualifications and experience, accompanied by copies of not more than three recent testimonials, must be received by me not later than 20th January, 1915.

FRANK RISDON,
Clerk.

Williton, Taunton.
December 30, 1914. (2,209)

ULVERSTON URBAN DISTRICT COUNCIL.

Wanted, in the Surveyor's Office, a General Assistant, at a salary of £1 15s. per week.

Candidates must be good and accurate draughtsmen, surveyors, and levellers, and have a practical knowledge of Sewerage, Street Works and Road Improvement Works. Providing his services are satisfactory, the appointment will be for about two years.

Applications, in the candidate's handwriting, giving full particulars of present and previous appointments, age, &c., accompanied by copies of not more than three testimonials of recent date, endorsed "General Assistant," must reach me by Monday, January 18, 1915.

C. TELFORD HAGUE,
Surveyor.

Town Hall,
Ulverston.
January 5, 1915. (2,231)

PAVIOR AND FLAGGER Wanted during the [illegible] Paving on Acton Street. Wages [illegible] per hour. Applications to be sent to Mr. W. H. Taylor, Engineer and Surveyor, Town Hall, Aylesbury, stating age and experience. (2,228)

WANTED a Temporary Assistant Clerk [illegible] Sewage Works Extension. State experience and salary required, also give references, to Box 1,500, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (2,227)

TENDERS WANTED.

Such advertisements may, in case of emergency,* ***only, be telephoned (City No. 1046) subject to later confirmation by letter.***

ARDSLEY URBAN DISTRICT COUNCIL.
ROAD MATERIAL.

The Council invite Tenders for the supply of Granite, Whinstone, Slag, Tar for Tar-macadam, and Surface-tarring work.

Specification and Forms of Tender may be obtained from the undersigned.

J. MORLEY,
Engineer and Surveyor.

Council Office,
Stairfoot,
Nr. Barnsley.
January, 1915. (2,226)

URBAN DISTRICT COUNCIL OF CHISWICK
TO CONTRACTORS AND HAULAGE PROVISION DEALERS AND OTHERS.

Persons desirous of tendering for the execution of work and supply of stores (separately) as under—

For six months, commencing 1st April, 1915:—

For the Hire of Horses and Drivers (with or without carts), Oils, Motor Spirit, Drysaltery, Ironmongery (heavy and light), Disinfectants, Aluminoferric or Copperas, Lime and Cement, Kentish Pit Flints, Hoggin, Blue Guernsey Granite, and other Broken Road Stone, York or other Paving, Tarred Granite Slag and Limestone Paving, Tar, Asphalt, Pipes, Gullies, &c., Printing, Stationery, Forage [illegible] Bedding, Hire of the Steam Pumps, H[illegible] Hire Engine, Petroleum (Grocery, Meat, Bread, &c.), and Maintenance of Fire Alarms, Telephones, &c.—

may obtain Forms of Tender on application, or by sending stamped addressed foolscap envelope to Mr. Edward Willis, ASSOC.M.INST.C.E., Surveyor, Town Hall, Chiswick, where specimens of certain of the goods (other specimens are deposited at the High-road and river depots) and Forms of Contract and Bond may be inspected after the 9th instant, between the hours of 9 a.m. and 1 p.m., or at any other time by appointment.

Tenders are to be made on the prescribed forms, and delivered in sealed envelopes to the undersigned not later than 4 p.m. on Wednesday, the 27th January, 1915.

(By order)
ERNEST F. COLLINS,
(2,232) Clerk of the Council.

THE CARDIGANSHIRE COUNTY COUNCIL.

The Roads and Bridges Committee of the County Council invite Tenders for strengthening and surfacing the Cardigan to Cenarth Main Road, from Maesycoed to Cenarth with Welsh Granite, and Tar-spraying. Plan and Specification, and approximate Bill of Quantities and Form of Tender may be seen at Twyside Llechryd. Form of Tender and Specification can also, on application, be obtained from the County Surveyor.

All Tenders, addressed to the County Surveyor, not later than the 23rd day of January, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

DAVID DAVIES.

County Surveyor's Office,
Felinfach S.O. (2,229)

BOROUGH OF PLYMOUTH.

Tenders are invited for the Construction of a 54-in. Cast-iron Outfall, about 120 ft. in length, on piles; Dredging a Channel 630 ft. in length; Laying a 54-in. Concrete Culvert, about 208 yds. in length, with all incidental Works in connection with the carrying out of the Surface-water scheme of the Eastern High-level Area.

Plans and Specifications may be seen, and Forms of Tender and Bills of Quantities obtained, at the Office of the undersigned on payment of a deposit of £5 in each, which will be returned on receipt of a *bonâ-fide* Tender.

The lowest or any Tender will not necessarily be accepted.

Sealed Tenders, which must be accompanied by the fully priced-out Bill of Quantities, must be delivered not later than 5 p.m. on Monday, January 18th, 1915.

Conditions upon which Forms of Tender will be granted may be seen at my Offices.

JAMES PATON,
Borough Engineer and Surveyor.

Municipal Offices,
Plymouth.
December 29, 1914. (2,205)

BOROUGH OF PLYMOUTH.

Notice is hereby given that, after the expiration of 10 days from the date hereof, the Corporation intend to enter into Contracts for the supply of the following Goods and Materials for one year:

Schedule No. 3.—Section A, Paints.
Section B, Varnishes.
,, 5.—Ironwork.
,, 7.—Petroleum Oil.
,, 8.—Broomheads.
,, 9.—Household Brushes.
,, 10.—Rope.
,, 11.—Iron and Steel.
,, 13.—Pitchpine, Deal, Flooring, &c.
,, 14.—Carbolic Powder.
,, 15.—Portland Cement.
,, 16.—Lubricating Oils.
,, 17.—Tar and Pitch, includes Refined Tar for use in the construction of Tarred Macadam Roads and for Tar-spraying.
,, 18.—Painters' Brushes.
,, 19.—Explosives.
,, 22.—Soap.
,, 23.—Wood Blocks, Soft.
,, 24.—Creosote.
,, 28.—Disinfectant Fluid (Bacteriological Test).
,, 29.—Granite Kerbs, Setts, &c.
,, 30.—White Lead, Red Lead, Linseed Oil, and Turpentine.
,, 31.—Refilling Machine Revolving Brooms.
,, 33.—Benzoline and Motor Spirit.
,, 34.—Tools.
,, 35.—Indiarubber Goods, Hose, &c.
,, 36.—Ship Chandlers' Goods (Sundry Oils, Waste, Grease).

Tenders must be based on the whole of a Schedule (with the exception of Schedules Nos. 3, 22, 29 and 36), and not on any particular item contained therein.

(Separate Tenders will be considered for Sections A and B of Schedule No. 3.)

Schedules may be obtained on payment of a deposit of £1 in cash for each Schedule. The deposits on the Schedules will be returned, provided *bonâ-fide* Tenders are received on or before the 16th January, 1915. Should the Contractor withdraw his Tender, or fail to enter into a contract, the amount of his deposit will be forfeited, and the Contractor who applies for the Schedules must do so on the distinct understanding that he is willing to abide by the terms of this advertisement.

The lowest or any Tender will not necessarily be accepted.

Tenders to be delivered not later than Saturday, January 16, 1915, addressed to the undersigned.

JAMES PATON,
Borough Engineer and Surveyor.

Municipal Offices,
Plymouth.
December 18, 1914. (2,182)

PUBLIC HEALTH ACT, 1875.

CITY OF ST. ALBAN.

EXTENSION OF MAIN SEWERAGE: CONTRACT No. 2.

TO SEWERAGE CONTRACTORS

The Corporation of the City of St. Alban, acting as the Sanitary Authority for the said City, are prepared to receive Tenders for certain works in connection with alterations and additions to the Sewage Disposal Works, near Park-street, on the outskirts of the City of St. Alban.

The works generally will consist of the construction of Concrete Sedimentation and Humus Tanks, Primary and Secondary Bacteria Beds, necessary Drains, Connections, &c., extension of Buildings and alteration to existing Bacteria Beds, &c.

Particulars, Bills of Quantities, and Forms of Tender may be obtained, and Plans may be seen, at the office of the Consulting Engineer, Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, after the 8th day of January, 1915, between the hours of 10 a.m. and 4 p.m.

Intending Contractors will be required to deposit a sum of Three Guineas prior to particulars being furnished, such sum being returned after the Corporation have come to a decision on the Tenders received, provided that the Contractor shall have sent in a *bonâ-fide* Tender, and shall not have withdrawn the same.

The successful Tenderer will be required to execute a Contract the draft of which may be seen at the offices of the Consulting Engineer aforesaid.

Tenders must be on the official form, each Tender in a sealed envelope (which will be provided by the Engineer).

Contractors must, with the Tender, return the Bill of Quantities and Schedule of Prices duly filled in in detail, and signed in the handwriting of the Tenderer or his authorised Agent.

Tenders must reach the undersigned not later than noon on the 27th day of January, 1915. The Corporation do not bind themselves to accept the lowest or any Tender.

Given under my hand this 4th day of January, 1915.

E. P. DEBENHAM,
Town Clerk.

St. Albans. (2,225)

NANTWICH RURAL DISTRICT COUNCIL.

AUDLEM AND DISTRICT: WORKS OF WATER SUPPLY.

CAST-IRON PIPES, HYDRANTS, SLUICE-VALVES, CASTINGS, &c., EXCAVATING FOR AND LAYING AND JOINTING WATER PIPES, &c.

The above Council is desirous of receiving Tenders (Contract No. 1) for about 2,100 tons of Cast-iron Water Pipes, Branches and other pieces; (Contract No. 2) for Hydrants, Sluice Valves, Fittings, &c.; and (Contract No. 3) for Excavating for and Laying, Fixing and Jointing about 50 miles of Cast-iron Water Mains, with all the necessary Sluice Valves, Hydrants, Fittings, &c., in connection with the above-mentioned works of water supply in the Rural District. Separate Tenders will be required for each Contract, and for the four sections (each approximately 12½ miles) in Contract No. 3, but one Contractor may tender for the whole.

The Council does not bind itself to accept the lowest or any Tender, and reserves the right to sub-divide the Contracts in such manner as may be deemed expedient.

Drawings and Specifications may be seen at the Offices of Mr. C. E. Davenport, ASSOC.M.INST.C.E., 152 Hospital-street, Nantwich, from whom copies of Specifications, Quantities and Forms of Tender may be obtained on the deposit of Two Guineas, which sum will be refunded on receipt of a *bonâ-fide* Tender and the return to the Engineer of all documents received from him.

Sealed Tenders to be sent in to me not later than Four o'clock in the afternoon of Thursday, the 28th January next, endorsed "Tender, Audlem, &c., Waterworks."

(By order)
H. G. ATKINSON,
Clerk to the Council.

Rural District Council Offices,
Nantwich.

NANTWICH RURAL DISTRICT COUNCIL.

CAST-IRON PIPES, HYDRANTS, SLUICE-VALVES, CASTINGS, &c.; EXCAVATING FOR AND LAYING AND JOINTING WATER PIPES, &c.

The above Council is desirous of receiving Tenders (Contract No. 1) for Cast-iron Water Pipes, Branches and other pieces; (Contract No. 2) for Hydrants, Sluice Valves, Fittings, &c.; and (Contract No. 3) for Excavating and Laying, Fixing and Jointing Cast-iron Water Mains, with all the necessary Sluice Valves, Hydrants, Fittings, &c., for purposes of water supply in the Township of Ridley, in the above-named Rural District. Separate Tenders will be required for each Contract, but one Contractor may tender for the whole. The Council does not bind itself to accept the lowest or any Tender.

Drawings and Specifications may be seen at the Offices of Mr. C. E. Davenport, ASSOC.M.INST.C.E., 152 Hospital-street, Nantwich, from whom copies of specifications, Quantities and Forms of Tender may be obtained on the deposit of ten shillings, which sum will be refunded on receipt of a *bonâ-fide* Tender, and the return to the Engineer of all documents received from him.

Sealed Tenders to be sent in to me not later than four o'clock in the afternoon of Friday, the 15th January next, endorsed "Tender, Ridley Waterworks."

(By order)

H. G. ATKINSON,
Clerk to the Council.

Rural District Council Offices,
Nantwich.

PLEASE MENTION "THE SURVEYOR" WHEN REPLYING TO ADVERTISEMENTS.

CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive Tenders for the Supply of Stores for one year, ending March 31, 1916—viz.: Lias Lime, Portland Cement, Drain Pipes, Gullies, Gully Pans, Brown Bricks, Timber, Drysaltery, Malleable Iron Castings, Iron Castings, Galvanised Goods, Iron and Steel Ware, Lamps, Glass, Enamelling, Brooms, Hose Pipe, Hose Couplings, Rubber Goods, Incandescent Mantles, and Miscellaneous Stores, including Cane Sewer Rods, Chamois Leathers, Tarpaulins, Lines, Cords, Mops, Coke Bags, &c.

Samples and Patterns may be seen on application to the Storekeeper at the Lamp Department, Cambridge-street, and the Corporation Wharf, Sheepcote-street. Forms of Tender, Copies of Conditions, and Specifications may be obtained, on and after the 4th inst., at the City Surveyor's Office, Council House, Birmingham, on payment of £1 for each copy, which will be returned on the receipt of a *bonâ-fide* Tender for the whole or any portion of the Stores required. Samples of Goods tendered for must be sent, carriage paid, to the undersigned; the samples of Portland Cement, 4 lb. in weight, to be delivered by the 20th January. Tenders must be made out on the Forms provided, and delivered at the undermentioned offices on the 23rd day of January, 1915, endorsed "Tender for Stores," and addressed to the City Surveyor, Council House, Birmingham. The person whose Tender may be accepted will be required to conform with the provisions of the Trade Board's Act, 1909. The Committee do not pledge themselves to accept the lowest or any Tender, and reserve the right to accept portions only of a Tender.

HENRY E. STILGOE,
City Engineer and Surveyor.

The Council House,
Birmingham.

Vol. XLVII. JANUARY 15, 1915. No. 1,200.

Minutes of Proceedings.

Extra Remuneration of Surveyors.

The question of the remuneration of surveyors to local authorities for extra work outside the scope of their ordinary duties is always a somewhat difficult one by reason of the legal anomalies surrounding it. The relevant statutory provisions are contained in sections 189 and 193 of the Public Health Act, 1875. Sec. 189 provides that every urban authority shall from time to time appoint fit and proper persons to be medical officer of health, surveyor, inspector of nuisances, clerk, and treasurer, and that, subject, in the case of officers any portion of whose salary is paid out of moneys voted by Parliament, to the powers of the Local Government Board under the Act, the authority may pay to the officers so appointed such reasonable salaries, wages, and allowances as the authority may think proper. The surveyor is not one of the officers part of whose salary was, at the date of the Act, paid out of moneys voted by Parliament (and is now paid by the county council); therefore, upon the face of it, it might be thought that the authority would have a free hand to make whatever arrangement they pleased with the surveyor, both as to salary and as to additional remuneration for extra services. This, however, would be to reckon without sec. 193, which provides that officers appointed under the Act by the local authority shall not in any wise be concerned or interested in any bargain or contract made with such authority for any of the purposes of the Act. If any such officer is so concerned or interested, or, under colour of his office or employment, exacts or accepts any fee or reward whatsoever other than his proper salary, wages and allowances, he is to be incapable of any rewards holding or continuing in any office or employment under the Act, and he is, moreover, to forfeit £50.

Now it is quite clear that this section debars a surveyor from receiving extra remuneration by way of percentage on the contract price for works. This was decided in *Whiteley* v. *Barley* (21 Q.B.D., 151). In that case a firm of contractors undertook to do certain work for a municipal corporation, and the contract contained a clause providing that the surveyor to the corporation should receive from the contractors, in respect of bills of quantities prepared by him, percentages on such amounts as he should certify to be due to the contractors from the corporation. A ratepayer commenced proceedings against the surveyor to recover the £50 penalty, and while such proceedings were pending the corporation passed a resolution to contribute £300 towards the surveyor's costs of defending the action. It was contended on his behalf that, inasmuch as a fixed sum equal to the percentage might have been lawfully paid to the surveyor as an "allowance," the invalidity of the payment was merely one of form. But the Court rejected this plea, and held that the surveyor was liable to the penalty of £50 imposed by this section. Moreover, on a further application, the Court quashed the resolutions of the corporation for the payment both of the percentage and of the £300 contribution voted towards the surveyor's costs and ordered those members of the corporation who had voted in favour of these resolutions to pay the costs of the application out of their own pockets. It may be observed in passing that, under the Public Health (Officers) Act, 1884, proceedings for recovery of the penalty under this section cannot now be taken, except with the consent of the Attorney-General (who presumably would not authorise a purely vexatious action), but in other respects the section remains in full force. The question remains whether it is ever lawful for a local authority to pay their surveyor for extra services outside the scope of his ordinary duties, so long as such payment does not take the form of a percentage or commission, and if so to what extent and in what form. Upon this point the authorities are by no means so clear as could be desired. If we consult Lumley's Public Health Acts (8th edition), we find on the one hand (at pp. 451, 456) a reference to a precedent for such a payment, and on the other hand (at p. 451) a statement which seems, at all events, to restrict the mode in which the object can be effected in a manner which is at the best somewhat arbitrary, and may in some cases be actually prohibitive. The precedent is the case of *Re* v. *Chancery Corporation* (23 J.P., 709). That was the case of a surveyor who had been engaged by the corporation as a "full-time" officer at a fixed salary for purposes connected with their existing and projected waterworks, it being expressly provided by the terms of his engagement that he was not to be paid for extra work. Subsequently, finding him to be qualified as an engineer, they dismissed the engineer who was superintending the construction of their new waterworks, and employed the surveyor in that capacity. It was held that the corporation might legally vote him extra remuneration for these services, which were outside the scope of his original employment.

On the other hand, after the reference to this case, we are confronted with the following statement: "In the case of a surveyor there is a provision authorising the making of an extra-

ordinary payment—*i.e.*, one in addition to salary. The board " (*i.e.*, the Local Government Board) " have suggested in some cases whether the object might not be attained by an increase of the salary of the officer for a definite period, the period and amount of the increase being so calculated as to make the actual benefit equal to that which would accrue if the proposed payment were made in a lump sum. At the same time the board pointed out that, if a council adopted this course, the period for which the increase of salary was awarded must be prospective—*i.e.*, must commence not sooner than the date of the resolution of the council awarding such increase." It is evident that this method, simple as it sounds in theory, may not always be easy of application, as cases may occur in which it may not be possible to gauge in advance the amount of extra work which will fall upon the officer, and for which it is desired that he shall have extra remuneration. But, apart from this, it is surely a sufficient comment on the unsatisfactory state of the law on this point to find that the only way a Government Department can suggest for carrying out the principle that " the labourer is worthy of his hire " is by, we hesitate to say " an evasion of the law " or a " legal fiction," but at all events a roundabout, clumsy, and probably in many cases ineffectual method of accomplishing what is just and fair. It seems to us that this is a matter which calls for the intervention of the Legislature in order to make the position clear.

* * *

Town Planning in 1913-14.

The report of the Local Government Board on Town Planning in 1913-14 shows that the ideas and ideals which underlie the practice of that science continue to make satisfactory progress. This is indicated not only by the increasing appreciation which is shown by local authorities of the advantages offered by the town planning part of the Act of 1909, but also by the fact that landowners are coming to realise more fully that the town planning idea is by no means inimical to their best interests. The board report that the schemes which have come before them have been chiefly concerned with the laying out of the main routes of communication through and from the areas dealt with; with the provision of open spaces; with the limitation of the number of houses which may be erected upon any particular area; with the careful setting back of the building lines, so as not only to secure abundant air space, but also to enable road widenings to take place hereafter at the minimum cost should unforeseen circumstances render those necessary; and with the restriction of factories and similar buildings to particular areas, and the setting aside of particular sites for public purposes. Referring to the conference organised in 1911 by the Institution of Municipal and County Engineers, and to the opinion then expressed by the board that the time had not arrived when it would be prudent to attempt to lay down a complete code of general provisions for insertion in town planning schemes submitted for approval, the report states that this view still holds good. Thus, although of the five schemes made last year, three follow very closely the same lines, the other two are of quite a different character, and are also totally unlike each other. As matter of general advice, however, the report suggests that local authorities should make their schemes as simple as possible, and should avoid complex regulations in regard to matters of taste and detail, and other things which it is not essential to settle at all events in the first instance. The over-elaboration of detail is a fruitful source of friction, and as a rule local authorities will be well advised in the early stages of a scheme to concentrate the attention of all parties upon those fundamentals in regard to which ultimate agreement is essential.

The report deals at length with the schemes which have been made by the Birmingham Corporation, the Rochdale Corporation, and the urban district councils of Ruislip-Northwood and North Bromsgrove. During the year under review authority was given for the preparation of twenty-three new schemes, and at its close twenty-two further applications were under consideration, and in twenty-nine cases the preliminary notices to persons interested had been given. The report shows that there has been considerable activity among the local authorities in the Greater London area, and reference is made to the question of arterial roads, in regard to which, it will be recollected, six important sectional conferences were held last year under the auspices of the board. Town planning in this country is still in its infancy, and although much has been accomplished since the passing of the Act of 1909, very much more remains to be done. It is satisfactory, therefore, to read this record of the activities of local authorities in the matter.

* *

Departmental Competition at Walsall.

There is a good deal of human nature even on municipal corporations, and it is not therefore surprising to read that at Walsall, where the gas and electricity undertakings belong to the town council, the business in connection with these concerns is carried on upon competitive lines. There was no disguise of the rivalry at the meeting of the town council on Monday, when the question to be decided was whether the new street which is being constructed to improve the approach to the town from the Birmingham road should be lighted with gas or electricity. The General Purposes Committee, which comprises the whole council, had reversed the decision of the Streets Committee, and had decided that the thoroughfare should be lighted by electricity. An attempt was made on Monday to get this upset, and in the course of the discussion it appeared that the Gas Committee had offered to maintain lights of 320-candle power at almost as low a price as the Electricity Committee quoted for 150-candle-power lights, and the latter department also wanted a guarantee that a supply would be taken for fifteen years. It appeared from the statement of the chairman of the Electricity Committee that at present the Gas Committee has almost a monopoly of public lighting. This is resented by the Electricity Committee, who propose to show in the new street what could be done in the way of public lighting, and they—so the chairman definitely asserted quite in the familiar language of the enterprising chief of a commercial undertaking—" would not be content until they had control of the whole street lighting of the town." What the chairman of the Gas Committee thought of this aggressive attitude on the part of his rival was plainly in evidence by his retort that " electricity had proved a failure wherever it had been tried for street lighting." Here we have also reflexed with almost 320-candle-power clarity the confident trading spirit animating the management of the municipal gas department. Whether, as a councillor suggested, that spirit would be subdued by vesting the control of both the gas and electricity concerns in one committee, or whether it should be subdued at all, are questions not easily answered. After all, the rivalry between the departments is merely a manifestation of that competition which individualists are in the habit of declaring is the soul of business. Whether it is being exercised unwisely, and therefore to the prejudice of one department or the other, is a problem which the ratepayers should, and probably will, settle themselves.

Flies and Health.

A few years ago to have asked the question, Do house-flies hibernate? would probably have provoked a laugh, but the results of modern research in showing that these pests are active carriers of infection has invested the question with a real seriousness. It was in 1908 that the Local Government Board authorised further experimental work in connection with the investigation of flies as carriers of infection, and the results of these experiments are embodied in a very interesting report that has just been issued. A large amount of information of general and scientific interest, and having important practical bearings in relation to public health, had previously been obtained. There still remain, however, for solution a number of problems relating to the life history of flies and their *role* as potential carriers of infection. The report under notice gives some contribution towards the determination of certain of these problems. It contains papers on (1) Hibernation of House-flies, by Dr. Copeman and Mr. Austen, in continuation of a paper by Dr. Copeman dealing with the same subject in the last report of the present series; (2) Investigation of the results obtained by Mr. Edgar Hesse on the destruction of flies by means of bacterial cultures, by Dr. Bernstein; and (3) Investigation of work, also initiated by Mr. Edgar Hesse, on the culture of the fly-fungus, *Empusa Muscæ*, by Mr. Ramsbottom, of the British Museum (Natural History). Determination of the circumstances under which flies are enabled to perpetuate their species from one year to another is obviously important in order that means may be devised for organised attack on the progenitors of the next season's fly population when most likely to prove effective. The one specially interesting and unexpected point emerging from the former inquiry was that not a single specimen of the house-fly (*Musca domestica*) was met with among the considerable number of hibernating flies caught in situations which have hitherto been regarded as the special habitat of this fly. Under these circumstances it was felt that further detailed investigation of the matter was needed, and accordingly enquiry on a more extended scale, and covering, as it proved, an extensive area, was initiated and carried through during the past winter. Once more, however, the results obtained afford no support to the belief that house-flies hibernate, in this country, in the adult state; and the problem as to the manner in which the species survives one season and the next is bridged over still remains unsolved.

Registration of Architects.

The annual report of the council of the Society of Architects for the year ended October 31, 1914, refers at some length to the question of registration—a matter in which the Society has taken a keen interest for some time past. It is, perhaps, a little unfortunate that there has been a fundamental difference of opinion between the society and the Royal Institute of British Architects as to the policy to be adopted, although both bodies have brought forward concrete proposals for registration in one form or another. In the early part of last year the institute decided not to proceed with a Registration Bill for the present, but to apply for an extension of their charter to enable them to confer the title of chartered architect upon all persons passing a stated examination, thus adopting a policy of voluntary registration within the institute. The society, on the other hand, have caused to be drafted a Bill embodying a policy of statutory registration for every member of the profession, whether belonging to an architectural body or not. The outbreak of the war has for the time being put a stop to the active promotion of both schemes, and the council, in their report, now express the hope that, as the war has had the good effect of drawing together the members of the architectural profession without reference to professional politics, this happy state may continue, so that by the time peace is declared some method may have been arrived at of settling any differences in regard to the means to be adopted in attaining the end which both the society and the institute have in view. We cannot but feel that such unity of purpose would in itself be a great asset in securing the success of any scheme which may be agreed upon. In this connection it is interesting to observe that the New Zealand Institute of Architects was successful last July in obtaining a Registration Act, having accomplished in one year what the profession at home has been seeking for thirty years. The report also makes reference among other matters to the action which has been taken by the council in regard to unsatisfactory competitions. In such cases, where amendments have not been secured, the competition has been barred, and members have been warned not to take part in it. On three occasions during the year the warning was disregarded, and the architects concerned are no longer members of the society.

Concrete and Sanitation.

The subject under consideration at the last meeting of the Concrete Institute was the "Application of Concrete in Modern Sanitation," and was introduced in an able and comprehensive paper by Mr. Henry J. Tingle, M.INST.C.E. The subject is one of great practical importance, in view of the ever-increasing tendency to use concrete, either plain or reinforced, in the construction of sanitary works of any magnitude. It is a common complaint against the Local Government Board that they are responsible for retarding the progress of reinforced concrete construction to a very great extent, owing to the unenlightened policy which they continue to pursue in regard to loan periods. This observation applies with peculiar force to sanitary works which are almost invariably undertaken by local authorities, and paid for by money raised by loans to which the sanction of the board has to be obtained. The present practice of the board is, as Mr. Tingle pointed out, in the case of reinforced concrete for works in contact with water or sewage, to require the capital sum to be paid off in a period of ten years, while in the case of ordinary concrete, under the same conditions, the period of repayment is thirty years. The result, of course, is that, although the initial cost of reinforced concrete is appreciably lower, the short loan period and the consequent high annual charge for repayment afford convincing reasons to most local authorities for neglecting the use of this material. A good deal of the earlier part of Mr. Tingle's paper was devoted to interesting particulars of concrete tubes, their strength and uses in various positions, while a description of the manufacture of such tubes by several firms forms a most valuable and interesting appendix. Although, as a rule, concrete tubes do not suffer any damage from contact with sewage, occasional instances of disintegration have been recorded, and further investigation appears to be necessary in order to ascertain the causes and learn the lessons of these failures. The investigation of failures is always a most valuable means of instruction if undertaken in the right spirit—a fact of which Mr. Tingle showed his appreciation by dealing at length with the failure and reconstruction of a concrete-covered reservoir, and temperature cracks in a concrete reservoir wall, both of which had occurred in his own experience.

Some Notes on the Progress Report of the American Public Health Association.

(SANITARY ENGINEERING SECTION.)

By G. BERTRAM KERSHAW, M.Am.Soc.C.E., M.Inst.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

The above report forms a document of particular interest to the engineer who specialises in sewage matters, and who must feel that it is yearly becoming more and more necessary to have a good working knowledge of the chemistry of sewage if the results achieved by his schemes are to be attended with success.

The report is divided into two parts, Part I. dealing with sewage works operation, while Part II. is devoted to the question of analytical methods.

Part I. opens with the statement that "the introduction of sewer systems . . . has brought about the need for treatment of sewage, in order to accomplish two purposes: —

"(*a*) To promote the comfort and convenience of the people by maintaining watercourses in a decently clean condition—that is, free from nuisance to sight or smell—so as to be fit for civic development, industry and recreation."

The word "nuisance"* is, perhaps, an unfortunate word to employ, since so much depends upon the personal equation; but it is difficult to suggest any other. Possibly "perceptible smell or unsightliness" would meet the case better.

It should be noted that certain trade waste waters, without causing nuisance to sight or smell, are withal often very hard when discharged from mill premises, and they are frequently subjected to purification processes which greatly increase this hardness. In many industries manufacturers would prefer a polluted water for industrial uses rather than a clean water of a high degree of hardness. The writer is under the impression that hardness of water has been held to come under the heading of pollution. Again, a practically clean water may indirectly bring about a serious nuisance in a stream—*e.g.*, hot condenser water, this causing destruction and decay of water weeds, and lowering the amount of oxygen which the stream water can hold in solution.

Heading (*b*): "To aid in protecting the public health when necessary by maintaining watercourses as fit sources of water supply, after adequate purification, or for the cultivation of shellfish."

This paragraph evidently implies—taken in conjunction with later observations—that, if the sewage works effluent goes wrong, some near-by source of water used for drinking purposes may be endangered.

It would seem a very doubtful policy to place any faith in a water supply undertaking which relied, even in part, for the purity of its water, and consequently for the safety of its consumers, upon the continued and uniform efficiency of an adjacent sewage works. Even supposing the effluent from a sewage works were uniformly of a high degree of excellence—a thing impracticable except in theory—storm overflow discharges would still presumably provide a source of danger.

The Sewage Disposal Commission, in their Fifth Report, paragraph 360, say: "We are convinced that rivers generally—those traversing agricultural as well as those draining manufacturing or urban areas, are necessarily exposed to other pollutions besides sewage, and it appears to us, therefore, that any authority taking water from such rivers for the purpose of water supply must be held to be aware of the risks to which the water is exposed, and that it should be regarded as part of the duty of that authority systematically and thoroughly to purify the water before distributing it to their customers."

It is to be noted that the committee, in dealing with the degree of technical skill required for [illegible] and efficient operation, point out that "it does not always follow because a sewage treatment works receives a large volume of sewage that the responsibility is in proportion to the magnitude. . . ." This fact is very often lost sight of. During the past sixteen years the writer has travelled some 500,000 miles in this country inspecting some hundred or [illegible] works, and he has seen several medium-sized sewage works of a somewhat indifferent character, both as regards design and construction, where a highly capable manager, by unremitting care and attention, has achieved results far better than would have been thought possible. It seems doubtful, given two sewage works, one a very large one and the other a small or medium-sized one, both treating similar sewages by identical processes, whether the large works can, or at any rate would, on the average, produce an effluent of so good a quality as the smaller works. Sub-division of management probably has something to do with it as regards the large works, but many other factors come into play.

Of special importance is the suggestion that the engineer responsible for the works, or some other competent person, should be called in at regular intervals to inspect and advise concerning the working of the plant. Such an inspection is common enough as regards machinery, boilers, &c., and there would seem to be no valid reason against making use of such a system where sewage works are concerned.

Most people will agree with the committee that the right type of manager is worth a good salary; yet how rarely is this found to be the case? It is impossible to get the right man for such a post without paying for it.

The fact that river-water temperatures during some four or five months of the year are very low, and that consequently there is less likelihood of smell at such times, has not been lost sight of in the report. During the cold months of the year river-water temperatures are often not much above 40 deg. Fahr., at which temperature clean river water will contain some 9 c.c. of oxygen per litre, whereas when the river water is of a temperature of 60 deg. Fahr., it has only a content of about 7 c.c. In hot weather, on the other hand, water-weeds and sunshine, together with many other purifying [illegible] come into action and go towards making up the deficit.

In connection with this point the writer may, perhaps, be permitted to quote from a book of his which is about to be published—viz.: "During the cool months of the year, it is an undoubted fact that a river or stream can receive more pollution without becoming a nuisance to the senses than would be possible in hot weather; in other words, a river receiving a constant degree of pollution throughout the [illegible] in hot weather, which would be totally absent in the winter."

Those who have had the misfortune to have to wade through screeds containing innumerable figures and voluminous chemical analyses will endorse the suggestion that records should not be encumbered with useless data, while the essentials should be made graphic wherever possible. It is extraordinary to see how often masses of figures are presented numerically when, if plotted graphically, they could be followed infinitely better: they would also occupy less space.

Coming to Part II. of the report, this is concerned with analytical methods, and perhaps it is presumptuous for an engineer to offer any comments; it is, however, beginning to be realised that, in order to be in a position to deal effectively and at the same time economically with sewage problems, it is necessary for the engineer specialising in this branch to possess at least a rudimentary knowledge of the chemistry of sewage.

In this respect it may be [illegible] that American engineers are considerably ahead of us, and it will be found that most American sewage engineers of any standing are not only able to interpret sewage and effluent analyses correctly, but quite capable, should occasion arise, of carrying out various tests themselves.

It is refreshing to note in paragraph 2 that a new line has been taken as regards tests for sewage and sewage effluents, and that the tests are the outcome

* "Nuisance," [illegible] has been [illegible] defined as "something materially interfering with the ordinary comfort physically or human existence."—G. B. K.

[illegible] sewage rather than using [illegible] under [illegible] conditions.

In Part II. paragraph [illegible] [illegible] preliminary treatment [illegible] effluents might be omitted [illegible] [illegible] [illegible]

The Application of Concrete in Modern Sanitation.*

By HENRY J. TINGLE, M.Inst.C.E.

Concrete has played its part in sanitation for many years, with more or less success, according to the skill of the designer and the quality of the materials and workmanship. The tendency in recent years has been to employ concrete more and more, and this tendency in the future is sure to extend its use in directions where now it is scarcely applied. Sanitation works have been particularly affected by the attitude of the Local Government Board towards reinforced concrete, as such works are generally undertaken by local authorities, who have to obtain the sanction of the board to the raising of a loan for the amount of capital expenditure, or else to obtain Parliamentary powers by means of a private Act. The great majority of authorities, however, adopt the first of these two courses of procedure, and the practice of the board is, in the case of reinforced concrete for works in contact with water or sewage, to require the capital sum to be paid off in a period of ten years, while in the case of ordinary concrete, under the same conditions, the period of repayment is thirty years. In cases where, in addition to reinforced concrete in contact with water, there is reinforced concrete not in contact with water, the periods for the loans on each class are sometimes equated together, and the loan for the whole granted for the period given by the equation.

Doubtless, in the early years of reinforced concrete, the board were well advised to act cautiously in the matter of sanctioning loans for the use of a combination of materials of which, in this country, there had been scarcely any experience, either as to its suitability or as to its life in sanitation works. The effect of this differentiation on the part of the board in the treatment of concrete, and of reinforced concrete, has been to curtail the employment of the latter in public works of sanitation. It is clear that, under the present conditions, where the loan is obtained for reinforced concrete, the burden thrown on the ratepayers annually to repay the principal and interest in equal annual instalments spread over ten years would be more than twice as great as for a loan of equal amount and rate of interest obtained for ordinary concrete, to be repaid in equal annual instalments in thirty years. The following example will illustrate the matter: If £1,000 be borrowed at 3½ per cent interest, to be repaid in equal half-yearly instalments of principal and interest for a term of ten years, the amount to be paid each half year equals £60 8s. 6d., and if for a term of thirty years the amount to be paid each half year equals £27 18s. 1d. The difference between those two amounts is, approximately, £32 10s., which is 116 per cent of £28.

Under these circumstances it is only natural that most authorities elect to use ordinary concrete in order to ease the burden on the present ratepayers, and throw part of it upon the ratepayers of the future.

The effect of the differentiation amounts to this, that, unless the cost of the works can be considerably reduced by the employment of reinforced concrete as compared to ordinary concrete, there is but little probability of local authorities deciding in favour of the former. The requisite saving may be effected in some instances, but, so far as the experience of the author goes, this is not generally the case.

With the experience that has now been obtained relating to the behaviour of reinforced concrete that is constantly in contact either with water or with sewage, it is permissible to hope that the time is not far distant when the Local Government Board will reconsider its attitude towards this material, and, in cases where it is proposed to make use of it, will sanction loans on more favourable terms as to the period of repayment than those now in force.

Concrete has been and is now extensively used in the construction of reservoirs, sewage tanks, filters, aqueducts, and water towers. Full descriptions of these works are to be found in technical journals and volumes of proceedings of the various engineering societies. The same holds good for similar structures in reinforced concrete, though to a more limited extent; but numerous examples are given in the catalogues issued by the various firms specialising in this class of work.

Mass concrete has been largely used in the construction of sewers of 4 ft. diameter and upwards. It is moulded in the trench, and supported by centering until set. Elliptical sewers are also constructed in this manner. In recent years reinforced concrete has been employed for sewers of both types, the mixture being sufficiently stiff to admit of ramming.

Concrete tubes have been extensively employed in main sewerage work for many years past, being supplied ready for use by firms who have taken up their manufacture.

Concrete tubes, unless strongly reinforced, should be laid on a concrete bed not less than 6 in. in thickness, and the concrete brought up round the tube as far as the springing. By the omission of this precaution many failures have occurred. In tubes liable to internal pressure the concrete should entirely surround them. The tubes have ogee, rebated joints which are luted with cement, and the inside pointed up.

Reinforced-concrete pipes have been used for water mains at Swansea against heads of 246 ft. and 500 ft., at Norwich for sewage rising main, head 131 ft., and at Clydebank for water, head 390 ft., and are about to be laid at Leeds for water. They have been largely used on the Continent, and 119 miles of 10-in. to 49-in. water mains were in course of construction in Flanders at the outbreak of the war. They have also been largely used in Paris. Twenty years since the municipality laid down 1 mile of 6-ft. diameter as a rising main for sewage head 115 ft., in a gallery alongside a steel riveted main of the same diameter. It has been found that the steel main requires considerable maintenance, and the concrete tube none. Concrete tubes are constructed to form manholes, water tanks and cesspits. Sewers, reservoirs, manholes, and so forth are constructed with moulded blocks of concrete which are supplied by various manufacturers.

As illustrating in greater detail the application of concrete to sanitation works, the author then described and illustrated the following examples: Failure and reconstruction of concrete-covered reservoir; temperature cracks in concrete reservoir wall; ejector chamber in concrete with steel-plate lining; concrete mole forming sewage outfall into sea; circular hydrolytic tanks in reinforced concrete.

At the end of the paper an illustrated appendix was given descriptive of the methods and manufacture of concrete tubes furnished by various firms specialising in such work.

DISCUSSION OF MR. TINGLE'S PAPER.

The President (Prof. Henry Adams) said he thought the paper was likely to be extremely useful to members engaged in municipal engineering. The author expressed the opinion that the concrete should be machine mixed. He would like to know whether Mr. Tingle was not in favour of batch-mixing as distinguished from continuous mixing. As to the test of the concrete tubes, most municipal engineers had been on the watch for experiments on the strength of pipes or sewers under load from above. It appeared that about 200 lb. per inch-run was sufficient to fracture the tube, but it must be remembered that in breaking it would not be short, unsupported lengths, but continuous. All experiments relating to this matter were of value, and a subject for investigation. The author referred to the vibratory movement as being useful in Jagger concrete tubes. He (the chairman) had had experience of the vibratory movement in connection with artificial paving, and it was found to be extremely useful in holding the material, and extended to stoneware for a longer period. The Bonna pipe was alluded to as exposed to currents of hot air, but his experience was that it required some protection from hot air. One would think it was rather sacrificing the strength of the pipes to shorten the time of their manufacture. With respect to Siegwart pipes, it might be asked why there should be a cruciform section. Personally, he preferred the simplest form, plain round or square; but, of course, there might be some reason for adopting the cruciform form. As to the failure of the reservoir, referred to by the author, they were not told where it was, or who was the

* Abstract of paper read at the last meeting of the Concrete Institute.

[illegible] gradually along so that the thrust was uniform. [illegible] cement and furnace slag, and the strong smell given [illegible] certain times, and it was found that furnace slag [illegible] to put down cast-iron tubing, and it could have been [illegible] turn of the tide. He agreed entirely with the chairman that the design of the reservoir described was such that it could not be otherwise than a failure. In forming the roofs of a reservoir it should not be forgotten that the covering was saturated with water, [illegible] away, with the result that a great weight was thrown [illegible] interested in the point brought out by the author with respect to the short term for which loans were [illegible] his experience it was intended to make use of rein- [illegible] found on the spot, and as only a fifteen years' term would be given it was decided, in the interests of the clients, to make use of mass concrete. There was a great deal of grumbling at the limitation of loans to ten or fifteen years in cases of concrete that came in contact with sewage, but a large factor of safety must be allowed, and he thought that the public authority had been quite right up to the present time. He would not say that in the near future they might not alter their views, but there was safety in going slow, and he expected that up to the present [illegible] thought they were justified in the stand they had made.

Prof. Stephen M. Dixon said there was [illegible] on which he would like further information, and that was the question of pipes under large pressure. How were the joints for those pipes made? There was sometimes a great deal of trouble through the percolation of water, and he would like to know if percolation had occurred in the cases mentioned by the author.

Mr. D. B. Butler remarked that as to the Local Government Board only allowing loans for ten years for reinforced concrete, and twenty years for ordinary concrete, Mr. Moss-Flower said they were right in going slow, and perhaps they were. If reinforced concrete was properly laid water could not attack it, and even if it did the lime compounds would act as a perfect preservative of the steel reinforcement. When properly made, even if the water got in it would become alkaline, and act as a preservative of the reinforcement. He thought it was rather a pity that the author had quoted tests which were more than thirty years old. He did not know whether these were the only tests available, but he thought it was rather misleading to give them, because cement had been vastly improved. The author suggested that English cement was not so good as that of Boulogne and Stettin, owing to internal control. He (Mr. Butler) had visited the works of Belgium and Germany, and he said without fear of contradiction that English cement nowadays was, if anything, superior to foreign cement, owing to the improvement of the English machinery. With respect to the reservoir which failed, he did not gather from the paper how much of the floor was covered with slag, and why. Slag contained a large amount of calcium sulphide, which gave out a smell of sulphuretted hydrogen. The speaker quoted the case of a sewer in connection with alkali works, the upper part of which was attacked by the gas given off from calcium sulphide. The result was that the concrete became thoroughly rotten, and the sewer had to be relaid altogether.

Mr. J. G. Sharp said he was all the more interested in the paper as concrete was quite the earliest material he ever had to deal with. It was quite true that concrete was not a new thing as applied to sanitation, but it was difficult to get engineers to take it up because of the cost. As to the Local Government Board's requirements, he could not help sharing the views of Mr. Moss-Flower. People said the War Department, the Board of Works, and the Admiralty used reinforced concrete, and why should not the [illegible] ment Board had to sanction the expenditure of money under the supervision of the local authorities, who were not essentially people of the wide experience whom the War Office and Admiralty could command. The officers of local authorities were not, in fact, as a rule, Westminster engineers. It was well known that concrete required most close supervision. Those who were making it constantly knew that the men must be closely looked after. Cement was a chemical article, and unless there was supervision at every [illegible] Unless a local authority which had received sanction to use reinforced concrete exercised the most careful supervision over the concrete, the concrete industry was likely to have a serious set-back. With reference to the old experiments quoted by the author, he took it that they were intended to show that the application of concrete to sanitation really dated back a large number of years. It was forty years since concrete tubes were introduced, and this fact was brought out by the experiments quoted. As to Stettin cement, he agreed with Mr. Butler that even in those days English cement was obtainable, and he was certain that nowadays it was quite impossible to beat English cement. He thought the Concrete Institute should endeavour to bring its views to bear upon the importance of fine grinding. Whatever standard specification was specified it required tightening up considerably, and it was economical to pay a little extra to get a more finely ground cement.

Mr. W. Campbell Sharman said much had been stated about cement, but little about the correct grading of the aggregate, which was almost more important than anything else with respect to concrete. He had great belief in a perfectly graded aggregate, but one was seldom able to get it. He had made experiments in which Leighton Buzzard sand and granite were used respectively, and the result seemed to prove that the aggregate was almost more important than the cement. He thought that more attention should be paid to this in the future than had been done in the past.

Mr. Allan Graham observed that the failure of the reservoirs would act as a good lesson for the future. With respect to the cruciform reinforcement, he took it that it was intended to hold the concrete in the right position between the longitudinal reinforcement.

Mr. Tingle, in reply to the discussion, said that when he used the term "machine-mixed" he meant lifted in batches; he did not mean continuously. The president also referred to his statement that, in some instances, artificial means were adopted to hasten the setting of the concrete while the tube was in the mould. That did not refer to the Bonna pipe. It was a general statement that, in some instances, concrete pipes were put under artificial means of drying in order to liberate the mould. With respect to the reservoir that failed, the area of the floor covered with furnace slag mixture would be about 20 ft. by 20 ft. It was really over a pothole of gravel under the concrete, and the pothole was 16 ft. in diameter. The concrete was not affected in other parts. Mr. Moss-Flower suggested that cast-iron tubing would be cheaper, but he (Mr. Tingle) did not think it would. Then he was asked how soon the tide followed on the laying of the concrete. They used to work until they were driven out by the water, and perhaps they could not go to that place to continue the work for two months. They could only work at spring tides. Then a question was asked how the joints were made in the pipes that stood the pressure at Norwich and Swansea. He referred them to the examples shown, and added that there was no percolation at all through the concrete if the pipe was properly made. His reference to the old tests was intended to show what was done in those days, and the difficulties that men who took up such work had to deal with.

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: SEVENTEENTH LIST.

During the months of October, November and December, 1914, the Road Board indicated additional advances to highway authorities, amounting, in the aggregate, to £170,935, of which £132,833 was by way of grant, and £38,092 by way of loan.

The advances made and indicated up to December 31, 1914, less indications cancelled, amount to

...,904,304. Of this total £1,508,585 is by way of grant, and £1,445,719 by way of loan.

The formal grants completed, with the approval of the Treasury, during the last quarter, amounting to £337,939, were applied as follows:—

Road crust improvements	£219,774
Road widenings and improvement of curves and corners	80,994
Road diversions	6,154
Reconstruction and improvement of bridges	4,620
New roads and bridges	26,467

ARMY OFFICERS' EXPENSES.

CHERTSEY OFFICIAL'S ALLOWANCE.

At the recent meeting of the Chertsey Rural District Council, points of considerable interest to surveyors were raised in connection with the war. The surveyor (Mr. H. Beeney) reported that he had offered his services as 1st Lieutenant in the 2nd London Sanitary Company, R.A.M.C., for immediate active service with the Expeditionary Force if required.

The Chairman (Mr. W. Shears): When will you want to go?

The surveyor said it was quite indefinite and uncertain when or if he would be called upon. He understood there was a dearth of officers for that particular work, and that being so he thought it was only his duty, as he was qualified for the position, to volunteer to go. He also wanted to know what the council would pay to his wife if he was called up.

Replying to the Rev. G. W. Grundy, Mr. Beeney said his pay would be 14s. daily, but it was common knowledge that expenses were so high that every penny was needed for one's personal requirements.

It was mentioned that no allowances were made for the wives and children of regular officers. Mr. F. W. Benham proposed that Mr. Beeney should receive full pay for three months, and that the matter should then be reviewed. This was seconded by Mr. E. Mears. Mr. F. J. McLennan moved as an amendment that half-pay be allowed, and the rent of Mr. Beeney's office be paid for three months, with review then. Captain G. E. Price seconded. The motion was carried by the chairman's casting vote, and was then unanimously agreed to.

The surveyor, therefore, will have his full salary of £250, but will have to pay the rent of an office for any new surveyor who may be appointed.

The Chairman inquired how Mr. Beeney's place could be filled until his return. Several members thought a retired surveyor would be willing to do the work; but the matter was left open for the present.

RELICS OF OLD SOUTHWARK BRIDGE.

Excavation in connection with the rebuilding of Southwark Bridge has (the *Globe* states) brought to light some interesting antiquities which were found in the old south pier. These include an inscribed plate of a kind of pewter, measuring 15½ in. by 12½ in., which was discovered under a layer of mortar on the top of the foundation-stone.

The inscription, which is clearly legible, says the stone was laid on May 23, 1815, by Admiral Lord Keith, and it concludes:—

> The work was commenced at the glorious termination of the longest and most expensive war in which the nation has ever been engaged.
>
> John Rennie, civil engineer.

Firmly encased in the actual foundation-stone a thick glass bottle was discovered. It contained a discoloured piece of parchment and fifteen Irish and English coins, the dates of which range from 1797 to 1814. They include a silver bank token of the value of 3s., and about equal in weight to half-a-crown.

Treatment of Artificial Stone. The architects to the staff institute belonging to Messrs. Swaine & Hunter, of Wallsend-on-Tyne, are having the artificial stone for this building treated with the powder "Pudlo." Apart from the waterproofing properties of the powder, it is reported to give artificial stone a bright and clean appearance, with sharp, clear-cut arrises. If this object can be attained, it is certainly more satisfactory than a non-Pudloed stone, which soon becomes rain-sodden and dirty.

LOCAL TAXATION RETURNS.

1911-12 FIGURES.

The summary and index of the Local Taxation Returns for 1911-12 have been issued as a Blue Book (price 1s. 3d.). The publication shows that local authorities in England and Wales received in 1911-12 from all sources, exclusive of loans, £150,285,000, the principal services of which being from public rates amounted to £66,500,000, and local lighting and transit undertakings (over £34,500,000).

The average amount of rates per head of the estimated population was, in London, £3 10s. 5d., and in the county boroughs £1 16s. 8d. In other urban areas the average amount of rates per head of the 1911 census population was £1 10s. 11d., and in rural areas £1 6s. 5d.

The expenditure of the local authorities during the year under review is given as £134,073,327, inclusive of loan charges amounting to £31,117,000. Among the items of expenditure were :—

Works and purposes.	Amount of expenditure.	Percentage of expenditure.
	£	
Baths, washhouses, and public bathing places	247,847	—
Cemeteries	723,456	—
Electric lighting (other than police)	4,118,421	3·1
Gas works	7,[illegible]	1
Harbours, docks, piers, and navigation	[illegible]	—
Highways, bridges, ferries, and highway rates (except the Highway Board)	[illegible]	11
Hospitals for infectious diseases (including Asylum Boards)	[illegible]	1·4
Lighting, &c.	1,861,[illegible]	1·4
Police, including pensions, clothing, and buildings	[illegible]	1·7
Public libraries, museums, and schools of art	[illegible]	·4
Lunatics and lunatic asylums	[illegible]	1·7
Lunatics not in lunatic asylums	[illegible]	·1
Markets	[illegible]	·1
Parks, pleasure grounds, and open spaces	1,[illegible]	·9
Police (not county)	[illegible]	1·3
Private street works and other works of private improvement	[illegible]	·4
Sewerage and sewage disposal	[illegible]	·6
Tramways and light railways	[illegible]	6·5
Vaccination	[illegible]	·01
Water works	[illegible]	1

It would appear from the entries in the foregoing table that, excluding expenditure defrayed out of loans, as compared with 1910-11, there was an increase of nearly £458,000 in respect of highways, bridges and ferries, an increase of £372,000 in respect of police and police [illegible], an increase of £[illegible] in respect of lunatics and lunatic asylums, and an increase of £49,000 in respect of sewerage and sewage disposal. Expenditure in respect of electricity supply undertakings increased by nearly £467,000; in respect of [illegible], dock, pier, canal and quay undertakings by

HIGHWAY MAINTENANCE AND REPAIRS: COST PER MILE.

Description of Road.	Gross expenditure (Receipts on account of roads deducted).	Mileage.	Average cost per mile, 1911-12.	Average cost per mile, 1910-11.
	£		£	£
Main roads repaired by county councils other than the London County Council.				
(i.) In urban districts	167,086	691	241	238
(ii.) In rural districts	1,770,942	18,071	98	88
Main roads repaired, or partly repaired by county councils, by contract				
(i.) Municipal boroughs (other than county boroughs)	284,957	1,242	229	227
(ii.) Urban districts (other than boroughs)	500,683	2,158	232	230

(iii.) Corporation of London	34,128	48	711	747

£300,000; in respect of tramways and light railways by £288,000; in respect of water supply undertakings by £130,000; and in respect of gas supply undertakings by £99,000.

The foregoing table shows, for the year covered by the report, the sums expended (otherwise than out of loans) by each class of local authority in England and Wales on the maintenance and repair of public roads, the mileage of such roads, and the average amount per mile of the sums so expended. Corresponding averages for the year 1910-11 are also given.

In addition, sums amounting to £11,582 were expended by parish councils and parish meetings in respect of footpaths and rights of way, and there was expenditure (not exceeding £13,000) by the London County Council on the maintenance and repair of the roadway of certain embankments and subways.

THINGS ONE WOULD LIKE TO KNOW.

(*Contributed.*)

Cannot the Smoke Abatement Society and others who have for so many years past been active in the abatement of the excessive smoke nuisance congratulate themselves that their labours have not been without definite result? Cannot everyone who has known London for the past twenty years say with truth that the old black fog, "the London Particular," as Dickens called it, has disappeared, and that this [illegible] and wasteful smoke? Should not this result be an encouragement to many of us who have for years past been trying to remedy some crying evil without yet perceiving any good resulting from our labours?

* * * *

Is it to be wondered at that tar-grouting, both single and double, has lately gone out of fashion, when we consider the number of failures there have been in this class of work? Is it not possible, however, that these failures are not due to the principle being wrong, but that they may have been caused either by want of skill in construction, economy in the quantity of grouting used, and the impossible conditions of the weather when the work was carried out?

* * * *

How long will it be before the Road Board give us a report on the experience they must by now have gained in the different descriptions of road construction which have now been adopted in this or other countries? Would not some report of this description be invaluable to all road makers?

* * * *

Are we likely ever to hear anything more of the scheme for bringing water into London from Wales? Does it not seem a pity that all the water now temporarily "stored" in the Thames Valley should be wasted? Is it not to be regretted in this connection that the Thames Valley is not of sufficient altitude to be of use in this respect, or that gravity cannot be [illegible]

* * * *

Is it a fact that many surveyors throughout the country are suffering from a lack of sufficient skilled labour for road maintenance and construction? Does this arise from the number of men who are enlisting in Kitchener's new army, or from the fact that the wages offered to roadmen are generally lower than those pertaining in the district for other classes of labour? Is it not perfectly true that the best materials may be wasted if handled by unskilled labour? When will those who are responsible for our roads realise that "mind and metal" are inseparable where good roads are required?

* * * *

Is it a fact that, although "best Wallsend coal" is still advertised by London coal merchants, not a single ton of coal from Wallsend has come to London for the last forty years? May we assume that this title is given to it on the same principle that all the best fowls come from Dorking, soles from Dover, oysters from Whitstable, hams from York, rabbits from Ostend, and pigeons from Bordeaux? As Shakespeare—or Bacon—said, "What's in a name?"

Cement Grouting.—Mr. A. Rothera, M.INST.C.E., engineer and surveyor to the Liversedge Urban District Council, desires information relating to contractors or others who possess a pressure cement-grouting machine who would be willing to quote for some work in Liversedge.

The Lateral Pressure and Resistance of Clay, and the Supporting Power of Clay Foundations.

By ARTHUR LANGTRY BELL. B.A., B.E., M.INST.C.E.

[The following is an abstract of a paper read at the meeting of the Institution of Civil Engineers on Tuesday evening last.]

This paper opens with a reference to the difficulty to be anticipated in attempting to estimate the lateral pressures and resistances of clay, its constitution and properties being obscure. It is pointed out that the engineer is not interested in the complex problems which attract the attention of the physicist, but would be content with a practical, simple, and sufficiently correct method of estimating the pressures and resistances exerted by clay, so far as these affect the design and stability of structures.

Published information is unfortunately insufficient to aid an engineer when confronted in practice with problems calling for a precise knowledge of the matter. He cannot hope to build a safe structure at the least cost unless he can make some reasonably accurate estimate of the forces with which he has to deal. Owing to reasons which appear later in the paper, the accepted theories of earth-pressure do not afford him much assistance.

There are two theories of earth-pressure ordinarily used in English practice—Coulomb's and Rankine's. Both these theories apply to "a loose granular mass"—a definition which cannot possibly include undisturbed clay. Both also presuppose a knowledge of the angle of repose. The text-books in current use give angles of repose for clay varying from 1 deg. to 45 deg., and observation of the material itself is of little value when selecting the angle to be used for calculations. Widely different results will be obtained according to the angles chosen. The results of calculations by these methods are also found to be at variance with observed facts.

In the author's view, the lack of agreement is due not so much to error in the existing theories as to a misapprehension as to the extent of their applicability. It is the purpose of the paper to bring before the members of the institution an extension or modification of Rankine's theory, which, when applied to clay, yields results more closely in accordance with fact and observation.

A short description is given of the monolith foundation work at Rosyth Dockyard, as it was in connection with this work that the investigation which forms the subject of the paper was made.

As the work of founding the monoliths proceeded, Rankine's formulæ were duly applied to the different cases which arose, but, in view of the doubt as to the applicability of the formulæ to clay, and as to the correctness of the assumed angles of repose, the results were regarded rather as aids to practical judgment than as actual and reliable solutions of the problem of stability.

A search through all available records did not yield much information of value or furnish a theory of clay pressure. Practical experience with tunnels and embankments appeared to indicate that the pressures exerted by clay resembled those due to a heavy fluid. This view is supported by a quotation which is made from a previous contribution by the late Sir George H. Darwin. The search revealed a high percentage of failures in work constructed in clay. The broad conclusions to which the investigation led were that there was no available theory of earth-pressure which, when applied to clay, would command the general confidence of engineers. There were no fixed rules of practice, and there were grave differences of opinion as to what intensities of pressure could safely be placed upon clay foundations.

Experiments were undertaken with a view to throwing further light upon the question. The first experiments described were made in a small testing cylinder 8 in. in diameter, fitted with gauges at the ends and sides. The results are given of a few tests with this apparatus, but the author does not regard them as having much value.

Up to this point, following established custom, it had been thought that, however difficult it might be to find the true angle of repose for clay, it might be possible by experiment, or as the result of experience, to hit upon an angle which, when introduced into the generally recognised formulæ would give correct results. Suspicions were now felt that the root of the difficulty lay deeper, and that the true reason why Rankine's and Coulomb's theories were not applicable to clay was because clay did not conform to the law of resistance to shear which forms the initial basis of both those theories.

Rankine expresses the primary law upon which his theory is based in the following words: "The resistance to displacement by sliding along a given plane in a loose granular mass is equal to the normal pressure exerted between the parts of the mass on either side of that plane multiplied by a specific constant."

The symbolical expression of this law is—

$$q = p_n \mu = p_n \tan \phi,$$

p_n representing the intensity of normal pressure on the plane of shear, and q the intensity of resistance to shear on the same plane. μ the "specific constant" is equal to tan ϕ, ϕ being the angle of repose.

If it could be shown that clay failed to comply with this primary condition, then it seemed clear that formulæ deduced from this condition were inapplicable to clay.

To carry out the desired tests another apparatus was made, consisting essentially of a vertical cylinder 3 in. in diameter and about 10 in. high. Fitting into the upper end was a plunger which could be weighted on top, so as to compress the clay placed within the cylinder below it. Arrangements were made whereby the clay (while under pressure in a vertical direction) could be sheared through horizontally. The vertical load upon the clay and the pull required to shear through the clay being both known and capable of variation at will, it is possible with this apparatus, by making successive tests with different specimens of the same clay placed under varying degrees of compressive stress, to determine the law which governs the relation between the ultimate shearing resistances and the normal pressures on the planes of shear.

Experiments made with sand gave results closely in accordance with Rankine's law as stated above. It was found that no kind of clay complied with this law. According to Rankine's law, where there is no pressure there is no resistance to shear, but in all cases clay was found to resist shear where the pressure was zero. The rate of increase of shearing resistance with advancing pressure was found not to be so great as would be inferred from Rankine's law, adopting the angles of repose ordinarily current in practice.

It was found that when plotted in diagram form (with equal horizontal and vertical scales) the results with clay could be represented, with reasonable accuracy, by straight lines. These lines did not, however, pass through the origin (as would be the case in material complying with Rankine's law). In all cases they cut the vertical axis which passes through the origin at a distance k from the origin, and with advancing pressure the resistance to shear increased in proportion to an angle α; α being the inclination of the straight line to the horizontal axis.

Stated symbolically, the law to which clay conformed—so far as its shearing properties were concerned—was found to be

$$q = k + p_n \tan \alpha$$

q representing the intensity of resistance to shear, p_n the intensity of normal pressure upon the plane of shear, and k the intensity of resistance to shear under zero pressure.

The law stated above becomes identical with Rankine's if k be taken as zero, and α as the angle of repose.

To make clear the state of stress and of resistance within a body subjected to external pressure, curves are shown illustrating the intensities of stress and resistance in sand and in clay. From these diagrams, and by a simple mathematical proof, it is shown where the plane of rupture occurs both in sand and

is 11s. The position of the plane of rupture ascertained in this manner is found to be identical with that deduced in a different way by Coulomb.

Having determined the position of the plane of rupture in clay, the author next proceeds, by considering the equilibrium of infinite number of cases of contact with the wall, to deduce formulæ for the pressure and resistance of clay. The formulæ are then compared with Rankine's in the following table:—

—	Rankine.	The Author.
p_1—intensity of active pressure on back of wall at any depth d	$= \left(\frac{1-\sin\phi}{1+\sin\phi}\right)$	$= k\cos^2\left(\frac{\pi}{4}-\frac{\alpha}{2}\right) - 2k\sin\left(\frac{\pi}{4}-\frac{\alpha}{2}\right)$
p_2—maximum intensity of horizontal resistance of material in front of a wall at any depth d	$= wd\left(\frac{1+\sin\phi}{1-\sin\phi}\right)$	$= wd\cos^2\left(\frac{\pi}{4}+\frac{\alpha}{2}\right) + 2k\sin\left(\frac{\pi}{4}+\frac{\alpha}{2}\right)$
p_3—minimum permissible intensity of downward pressure on foundation at heel of wall (depth H)	$= wH$	$= wH\cos^2\left(\frac{\pi}{4}-\frac{\alpha}{2}\right) - 2k\sin\left(\frac{\pi}{4}-\frac{\alpha}{2}\right)$
p_4—maximum permissible intensity of downward pressure on foundation at toe of wall (depth D)	$= wD\left(\frac{1+\sin\phi}{1-\sin\phi}\right)$	$= wD\cos^2\left(\frac{\pi}{4}+\frac{\alpha}{2}\right) - 2k\sin\left(\frac{\pi}{4}+\frac{\alpha}{2}\right)$

These formulæ suffice for the design of retaining walls in clay, the surfaces being assumed horizontal; the paper is limited to the consideration of this case only.

If k be taken as zero, and α equal to ϕ, the new formulæ (with one exception) become identical with Rankine's. The exception is the minimum permissible intensity upon a foundation—is then discussed, and reasons are given for adopting the newer formula. It is also pointed out that there is another essentially practical reason for the final abandonment of the value wH—namely, that, by what appears to be the general consent of engineers, it has, in fact, been already abandoned. It is questionable whether any large retaining wall has been built in accordance with it.

It was thought desirable to supplement the theoretical work by making direct observations of pressure within a large mass of clay. The four diaphragm gauges used in the previous cylinder tests were built into the side of one of the monoliths, being arranged in two pairs. The gauges of the lower pair were fixed side by side at a height of 10 ft. above the cutting edge of the monolith shoe, while directly above them, and 12 ft. 8 in. higher up, were the two remaining gauges. By adopting this arrangement it was intended that each gauge-reading should constitute a check upon the reading of that beside it, while the readings of the lower pair at any depth would be checked at a later date by those of the upper pair when the latter reached the same point.

The actual uncorrected readings of all four gauges, taken from time to time as opportunities offered during sinking, are shown by diagrams, together with a section of the strata through which the monolith was sunk.

Unfortunately, one pair of gauges was spoiled by leakage, and, owing to damage by blasting, the records obtained from the other pair were insufficient to confirm completely the theoretical conclusions previously obtained. But, so far as the records went, they appeared to be in reasonable conformity with the theoretical position discussed in the paper.

The laying of too much stress upon the few readings obtained is deprecated, and the practicability of making effective use of the new formulæ is discussed. It is pointed out that it is not easy, when designs are in progress, to obtain clay in its virgin state, and from considerable depths below the surface, for the purpose of making tests, and in certain methods of construction—the sinking of monoliths, for example—the strata are often never seen in their normal condition, even when the works are in progress. Further, the building of a new work may have, in the course of years, the effect of altering the condition of the strata which press upon the structure. What the extent of these changes will be, and whether they will be beneficial to stability or otherwise, will never be determinable by purely mathematical methods. If reasonably correct results are to be obtained, some measure of judgment must lend its aid towards the solution of the real problems of earth pressure which occur in practice, as distinguished from the simplified and somewhat unreal problems with which theorists necessarily deal.

The paper concludes with the usual formal acknowledgments, and a tabular statement of average values of k and α, so far as present experience goes. The appendices include an independent proof by Prof. Maurice F. Fitzgerald yielding results identical with those obtained by the author by different methods.

DIARIES AND CALENDARS.

One of the neatest desk calendars we have received is that issued by Messrs. Constable, Hart & Co., the well-known quarry owners and slag tar-macadam and tar-paving manufacturers, whose head office is at 41 Eastcheap, E.C. This contains date sheets for both this and next year, the whole being tastefully bound in dark green leather. A pocket diary and notebook accompanies the calendar.

A red leather pocket-book of excellent quality is being presented by the Dussek Bitumen Company, Bromley-by-Bow, E. This firm are, of course, the manufacturers of the "Trinidite" binder—a preparation which, they are careful to point out, is obtained solely from natural bitumen—and "Bitite," which is now being extensively employed for grouting granite setts, laying wood-block paving and surfacing, and sealing tar-macadam and all other bituminous roads. A detachable diary is provided with the pocket-book.

A Municipal Cinema. At a meeting of Pwllheli Town Council lately, the borough surveyor reported that the working of the cinema, which was taken over by the corporation some months ago, has been very satisfactory, and that a nett profit of £120 was made. The council decided to grant an honorarium to the surveyor for managing the pictures so successfully.

Early Street Lighting Troubles.—The *Times* quotes from its issue of January 10, 1815, the following paragraph: "The gas-lights in Fleet-street and Ludgate-hill were not lighted up yesterday evening, nor will they, until the latter end of the present week, owing to a branch now forming from the main pipe in Fleet-street to lead up Bridge-street. As reports have gone abroad to the prejudice of this undertaking, under Messrs. Grant, Hargrave and Knight, we are induced to state our belief that no exertion on their part has been spared to light up the district through which their pipes run. The apparent delay is, we are assured, ascribable entirely to those obstructions which are inseparable from the nature and extent of the works, and the number of workmen, of various callings, which are requisite."

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

MEETING AT WIMBLEDON.

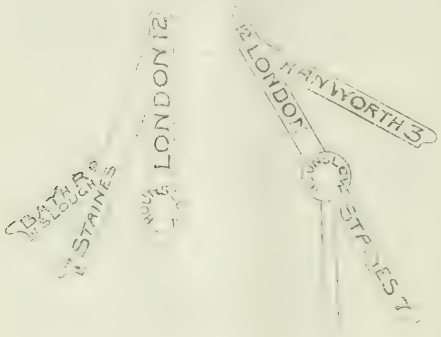
A meeting of the above-named body took place at Wimbledon on the 2nd inst., when, following a round of visits to the sewage works, cemetery extension, and Wandle Park open-air bath, the members assembled to listen to papers prepared by the borough engineer, Mr. C. H. Cooper, M.Inst.C.E. The company included Messrs. R. H. Jeffes (vice-president), who presided, H. T. Mather (Surbiton), F. R. Capon (Epsom), W. W. Gale (Carshalton), F. Wilkinson (Wimbledon), G. F. Carter (Croydon), S. H. Chambers (Hampton), M. Hainsworth (Teddington), F. W. Pearce (Twickenham), E. Willis (Chiswick), J. S. Crawshaw (Weybridge), E. Young Harrison (Guildford), J. A. Webb (Hendon), and J. G. Carey (Heston and Isleworth), hon. secretary and treasurer.

At the sewage works the visitors had explained to them the new method of treatment, of which some particulars were given in The Surveyor recently, and which was alluded to in the presidential address of Mr. A. P. I. Cotterell before the Institute of Sanitary Engineers last week [see p. 32 *ante*]. The process, which is being worked by the S.O.S. Company, has for its object the recovery of the valuable constituents of the sludge, for all of which, it is claimed, effective use can be found.

Following tea at Wandle Park House, Mr. Cooper submitted a paper on the question of

ROAD-DIRECTION SIGNS.

It was well said, remarked Mr. Cooper, that "Necessity is the mother of invention," and were it not that in the autumn of 1913 he found himself



Types of Mr. Cooper's Road-direction Signs.

beneath a burning cycle at a road junction, he would not have realised the necessity of a driver being acquainted with what he had to encounter at such a junction. There was only one way in which a driver unacquainted with the locality of which he was speaking could, before he reached the junction, acquire the knowledge to avoid such a mishap, and that was by reading a plan sign such as he proposed to describe.

On returning to Wimbledon Mr. Cooper prepared a model showing his system applied to the intersecting of two roads which consisted in placing a post with direction arms in each road approaching the junction at say 100 ft. back. The junction was reached, thereby enabling a driver to know which road he had to take in order that when he reached the junction his attention might be solely directed to the avoidance of oncoming traffic which, in the majority of cases, he could not see until the junction was reached. Junctions might therefore be taken as the points of greatest danger. It was at such points, however, that direction signs were placed in all the systems that had been considered.

When Mr. Joseph Bowen, one of Mr. Cooper's assistants, saw the model he suggested an essential improvement—namely, the placing of the direction arms in one place, facing the traffic approaching the junction, which (*a*) facilitated reading the writing on the arms, and (*b*) provided that the sign took the form of a semaphore plan of the junction, and set out that was most important for a driver to know—namely, the angles at which the various roads joined.

Mr. Cooper contended that none of the systems of direction signs which had been considered provided the following essentials for the safety of traffic which his own signs did—namely: (1) Supplying the driver approaching a junction with the direction of the road he had to take, &c., 100 ft. before he reached the junction; (2) allowing the driver to see a semaphore plan of the junction by which he was acquainted with angles at which the various roads joined; (3) lettering of sufficient size for the writing to be read at a distance of 200 ft., so that when travelling at 20 miles an hour seven seconds was provided in which to read the sign, and three and a-half seconds to consider how to negotiate the junction; (4) all working in one place facing the driver.

Mr. Cooper proceeded: "Like most good things, the system is costly, as a post and sign have to be placed in each road approaching a junction; whereas in the other systems one post sign suffices. . . . In no case can the arms be so placed on a single post as to be read from every direction. Many systems attempt to allow of this, but in such cases each arm cannot point direct to the road it refers to; and, further, the writing is distorted by arms being placed at an angle.

"A most important point is the system to be adopted as to the directions to be placed on an arm, bearing in mind that the writing has to be read at a distance of 200 ft., which necessitates 3-in. letters. The top line should be the name of the principal town to which the road leads, with its distance in miles or kilometres, the bottom line that of the nearest town or village. Thus, an arm at Hounslow directing to the Bath road should have: Bath 97; Slough 11.

"Except in special cases, no other information should appear. . . . The back of the boards are left blank.

"The signs as constructed in iron provide for the arms being threaded on a screen bolt between two boss plates, one being fixed to the post supporting the sign. The arms can thus be placed at the desired angles, and when placed in position are cemented together by a ring of composition. On being screwed home, the composition sets hard, and so excludes wet from entering the boss."

Mr. Cooper went on to suggest that, if plans of a junction as read from each road approaching were arranged on a post in the form of a lantern, so that the plans could be read from a distance of from 200 ft. to 300 ft., that would answer all the requirements met by the semaphore sign. By placing a light in the lantern, information would be afforded approaching traffic by night as well as by day. Unfortunately, plan reading was not sufficiently general; but he believed that in years to come such a sign would be insisted on, as it told the driver the full story of what he had to negotiate. No matter how intricate a junction might be, a semaphore plan, or, better still, an actual plan, showed what a driver had to negotiate in a way no other sign could do.

A number of lantern slides showing the application of the semaphore signs to various intersections were shown by the reader of the paper.

Mr. Cooper afterwards replied to a number of questions on points of detail raised by the members. Dealing with a suggestion of Mr. Willis that the posts should be placed further away from the intersections of roads than 100 ft., he pointed out that the principal thing to keep in view was the facility with which the signs could be read, and his object had been to enable that to be done in seven seconds. Where it happened that a vehicle was travelling fast, the result of any lessening of the distance he had proposed might be that, by the time the junction was reached the driver would have forgotten the direction he had to take. The vertical sign indicating a through road might present difficulties to those unaccustomed to reading such signs, but would be understood in the process of time.

A hearty vote of thanks was accorded to Mr. Cooper for his paper.

The Sheffield Corporation Tramways Bill.—The Parliamentary agents to the Corporation of Sheffield have deposited for next Session the Bill under which it is proposed to obtain power to acquire that part of the tramway constructed by the corporation of Rotherham within that part of the parish of Tinsley added to the city in 1911. The Bill also proposes to empower the corporation to expend £17,520 for the general purposes of their tramway undertaking.

Institute of Sanitary Engineers.

MR. A. P. I. COTTERELL'S PRESIDENTIAL ADDRESS.

(Conclusion.)

In the course of his recent presidential address to the members of the Institute of Sanitary Engineers, the major portion of which was reproduced in our issue of last week, Mr. A. P. I. Cotterell quoted from a report dealing with several towns in Lancashire and Cheshire a number of instances illustrating the conditions as regards housing that exist in portions of our urban and rural districts. He said:

I do not give these instances as exceptional. Probably they are no better and no worse than the average conditions of living and, and they certainly correspond with cases that I myself have come across.

We need not conclude that insanitary houses are always due to the neglect of an absentee landlord. It is far too often the small owner of the cottage occupied, who is also the owner whose property is in such a deplorable condition. The difficulty is intensified when such a cottage is both owned and occupied by a poor widow whose little all is in the property, and who really has not the means to carry out the necessary sanitary alterations.

As regards overcrowding or insufficiency of accommodation, it sometimes arises through the influx into the locality, either permanently or temporarily, of some of the better-class town dwellers who like to have a country cottage to retire to, but who do not realise that this makes one house the less for the indigenous population.

Any traveller by some of our main lines out of London looking through the windows must pity the circumstances of the dwellers in the mean streets and dirty courts that he passes. Something of the same kind of thing can be seen in many provincial towns where the railway runs in embankment or on viaduct. But it is not only the slum that excites the pity of the visitor. I was travelling the other day in South Wales with some Canadian colleagues. We passed through rows of modern terrace houses with backyards abutting on the line. The Canadians were not favourably impressed. The houses were of a far higher character than those I have described, but to their eyes they were far below what they ought to be, and not to be compared with the houses at Winnipeg, "where there was so much more room."

There are other problems mixed up with that of housing when the poorest poor are considered. There is the question of utterly insufficient wages to meet an economic rent, of inability to rise out of the slough in which they have lived so long, of want of resource, and of a love for a herded life in narrow courts or congested buildings.

A little time ago an investigation was made by Mrs. Pember Reeves on family life in some of the poorest districts of Lambeth. It is sorry reading to learn how these people struggle against almost overwhelming odds to keep a foothold on life. There are families getting less than £1 a week, who, when rent and similar outgoings are paid, have 3d. or 2d., or even less, per head per day to live upon. But one striking fact is noticeable—that those who pay more for a healthy dwelling, thereby involving sacrifice in food, are healthier, or at least rear their children better than those who adopt the opposite course. Some spend as much as 35 per cent., or even 45 per cent of their earnings in rent. What courage there must be among such people! How can they do it? And what must it mean when the cost of food goes up!

The able investigations carried out by Booth and Rowntree, and the noble lives lived by Octavia Hill and others like her, have probably done more than anything else to rouse the public conscience in the matter of urban housing. The nation had to do it when it came to know the facts. We can gladly acknowledge the efforts made by London and by many of our large cities to house some of their population under better conditions. Liverpool is shouldering a rate of 1½d. in the £ in order to house at rents of from 9½d. to 2s. 9d. per week people unhoused from insanitary areas who were utterly unable to rent a decent dwelling. The corporation declare that it pays them handsomely. Typhus has practically disappeared, the typhoid death-rate has fallen nearly 75 per cent in ten years, the mortality rate has been reduced from 50 to 27 per 1,000, public-houses have been swept away, and the police are losing their usual employment. Colonel Kyffin-Taylor, M.P., the chairman of the Corporation Housing Committee, says: "Some of the tenants in our buildings so improve their position that they ask for, and obtain, our better houses, and some get well-to-do and go further out into houses built by private enterprise. It is untrue to say that these people will make slums of any place they go to. It is easy for folk who live in charming houses, wear lovely clothes, and have lovely gardens to say that environment makes no difference. Liverpool says that in its experience that statement is wholly untrue. Fifteen years ago the people objected to being disturbed. Now some of them want to be disturbed, and are anxiously waiting their turn, and those whom we have rehoused have learned to realise and value their surroundings to such an extent that money that previously went in one direction has gone in another, and they have new aspirations, new ideas, new hopes."

There is one part of the United Kingdom where very notable progress has been made in housing. It is where, perhaps, one would least have expected to find it—viz., in the rural districts of Ireland. These changes have been brought about by a wise administration of the law under successive Ministries. From 1883 to the end of 1912 no less than 42,640 cottages were built by 211 out of the 213 rural district councils of Ireland at an average cost, including buildings, roads and land, of £185 per house, and containing usually one living-room and three bedrooms. Of the above number more than half have been erected since 1906. It has been possible to carry out this great work because the State undertook a substantial contribution towards the cost, amounting practically to 36 per cent, and the houses built can therefore be let at low rents within the compass of the wages of those who inhabit them. Not only so, but the working of the Land Purchase Acts has brought about great changes among the farming class. A recent holiday visit to the south-west of Ireland vividly impressed upon me the improvement in the well-being of the rural population. Again and again I passed a dwelling where the former house had been replaced by a new and substantial addition into which the pig was apparently no longer allowed to enter, but was relegated either to the ramshackle shanty alongside or to its own stye. It is not for me to enter into a discussion of the wisdom or otherwise of a procedure that involves a heavy subsidy from the State, but the effect in Co. Cork, where an exceptionally large number of houses have been built, does not seem disastrous, for, although wages have also increased from 30 to 50 per cent, the district generally is stated to be prospering.

In England changes are also taking place. The erection of better cottages in urban and rural districts and the development of estates to rehouse congested areas is also proceeding. I ask that it should not be allowed to slacken during this time of stress and of prodigal expenditure in other directions. The fact that immediately after the declaration of war an Act was passed through all its stages in one day providing for the issue of £4,000,000 for housing purposes, although not very much when compared with the huge sums now being spent by the nation, shows the importance attached by the Legislature to the subject.

COST OF BUILDING.

The cost of building naturally varies in different parts of the country, and according to the accommodation considered necessary. The houses already erected in districts in England that have undertaken housing appear to run from £300 to £160 per house. A concrete cottage exhibition held recently produced designs for buildings containing a living-room, scullery with offices, and three bedrooms for £125, exclusive of builder's profit, sanitary fittings, and drainage, fences or land, which, if added, would total up to

much the same outlay as ordinary buildings. I think, therefore, that we may take these as rock-bottom prices.

Under the favourable loan conditions hitherto allowed it has been found possible by local authorities to let houses of the values named at rents varying from 7s. to 5s. a week, and in a few cases rather less, before a point is reached where, as in Liverpool and in Ireland, a part of the rent has to be paid by others. These are lower rents than private enterprise can possibly afford to charge, even with land acquired on the same terms. The consequence must be that private house building for the poorer classes will tend to be cut out, and the onus of providing the necessary cottages will fall upon the local authority. An immediate consequence of this legislative change may easily be a shortage of houses and worse sanitary conditions unless localities are stirred up to undertake the duties now placed upon them by the State.

TOWN PLANNING.

I have not as yet mentioned town planning, but it is in this direction that I think we should look for an effective solution of the problem of housing. To some extent town planning is a revival of an art almost stamped out by the congestion that came with the commercial developments of the nineteenth century; but modern town planning can do more than its predecessor—it can introduce health as well as beauty. Some of our congested areas are past praying for, and the best thing we can do is to leave them to inevitable destruction while new and better conditions are started elsewhere. I think we not only need to regulate the housing of the workman, but we should also regulate the situation of the places where his work is done. There is a danger of factories crowding too much upon one another, quite as much as of people; let them be kept sufficiently far apart and the relief of human congestion will follow.

In these days of improved and improving traffic facilities the wider spacing of the country's workshops is not impossible. Hence I think that we can support the development of new suburbs, making them garden towns if you will, and design them for happier conditions than can ever be made of the old unhealthy areas. We can advocate also the grouping of our agricultural population in new and better cottages, so that life both in city and in country may be more like what it ought to be.

There is another feature of housing that must not be overlooked. The working man of to-day now needs, and is entitled to demand, better amenities and greater conveniences than were considered necessary forty or fifty years ago. He has been educated by order of the State, and his outlook on life has been completely altered thereby. All this has brought about a standard of comfort unknown to previous generations.

RENT AND WAGES.

Then, again, sanitary teaching pressed home year after year has made us to be a cleaner nation than we were. But cleanliness cannot be got for nothing; it costs to be clean. The mother who sewed her boy up for the winter did it with the object of economy as well as the man who, according to a well-known advertisement, omitted to use soap for quite two years. It is all right to provide greater cubic space, better windows, a bath, and other sanitary conveniences, but they not only affect the first cost, they increase the annual upkeep of the tenant.

Has the wage paid kept pace with the growth of requirement? Is it not a fact that the cost of housing alone, to say nothing of other things, has outstripped the wage paid to the householder? Should the workman still be expected to spend so large a proportion of his income on rent when his family has so many other needs to be satisfied before it can fulfil its duty to the State?

It may be said that these questions might have been answered a year ago, but now that the nation is struggling for its existence all such things have to be put aside. It would be a poor victory that succeeded in overcoming other nations but failed to maintain the vitality of our own. And this is recognised. While large sums are being poured out for the maintenance of the Navy and of the Army in the field, for the first time in our history, I believe, we are also caring for the wives and dependents at home. Steps have been taken and duties shouldered that cannot be entirely abandoned. It has been done because we know it is as true to-day as when Canning used the words 100 years ago—

> "Princes and Kings may flourish or may fade,
> A breath may blast them as a breath has made,
> But a bold peasantry our country's pride,
> When once destroyed can never be supplied."

We can therefore never be quite the same again. We have undertaken a responsibility towards one another that should not be entirely set aside. It is an outcome of the spirit of the age—a spirit that will continue after the responsibilities raised by the war shall have passed away.

Votes of thanks to Mr. Cotterell for his address, and to Mr. J. D. Watson, the retiring president, for his work during the past year, were passed with acclamation.

In responding, Mr. Watson referred to the prosperous year which had just come to an end, and the appreciable reduction in the debit balance as compared with the debit balance at the end of 1913. Mr. Watson suggested that it was more than probable that his successor in the chair would have greater difficulty in increasing the membership and the income of the institute than he had had. This, he pointed out, would be owing to war conditions, which necessarily made heavy demands upon the purses of all. That evening (Mr. Watson stated) he had dined with a member of council of a London club of which he was a member, who told him that, owing to resignations already sent in, voluntary remissions by the council of subscriptions due to the club by members who were on service, the payment of wages of servants who had gone to the Front, the wages of temporary men engaged to fill the places of those who had gone to the Front, and so forth, the club, it was estimated, would this year be involved in a loss of income equal to about £5,000. Clubs were not to be the only sufferers from our participation in the greatest war recorded in history. Institutions like theirs were sure to suffer in a similar manner, and it behoved all who had the welfare of the institute of Sanitary Engineers at heart to help the new president and his council to carry on the work with the utmost economy and circumspection. Mr. Watson, in commenting on the presence of a number of members of the 2nd London Sanitary Company of the R.A.M.C., congratulated their captain (Mr. A. J. Martin) on his promotion to the rank of major, and made reference to Major Martin's high ideals in relation to education in sanitary science, and the utility of sanitary companies as units of every army, and expressed the hope that his advance in rank would give him increased facilities for emphasising his advanced views in influential quarters. He wished, however, to draw attention to the wide difference between those ideals, which they all shared, and the immediate purpose of the War Office in sending sanitary companies into active service. He pointed out that it was misleading to call for trained engineers as recruits for those companies. The class of man the War Office needed to give effect to its purpose was the labourer and the navvy, as the work required of them was the most menial that could be imagined. Unless in exceptional cases, it was unlikely that the men would be called upon to superintend or direct the work of scavenging camps; but they would be called upon to do the scavenging themselves—most necessary work, no doubt—and he gave all honour to those who did it; indeed he was lost in admiration of the brave, self-sacrificing men who knowingly undertook it for love of country; but it was surely not work for highly educated men. Only that morning he had received a letter from a young friend of his, a Master of Science, an associate-member of the Institution of Civil Engineers, and a Fellow of the Geological and other learned Societies, thanking him (Mr. Watson) for preventing him from joining the 2nd London Sanitary Company, which he stated he would have done had it not been for his plain speaking. The work which the War Office had in view for the sanitary companies was necessary—indeed, there could be no better for the maintenance of the health of the troops—but there should be no misapprehension in the minds of recruits as to its nature, and any attempt to enlist men of education was like putting round men into square holes, and it was, moreover, a deliberate waste of skilled material which the country could ill afford at the present time.

Coventry's Growth.—More than 2 miles of new streets were taken over by Coventry Corporation last year, and plans for 1,189 new houses were approved.

NOTTS COUNTY SURVEYORSHIP.

RESIGNATION OF MR. E. P. HOOLEY.

Mr. E. Purcell Hooley, M.Inst.C.E., who has occupied the position of county surveyor for Notts since 1890, and is well-known throughout the world over, we are sorry to learn, has tendered his resignation, and the matter is being considered by the Highways Committee of the county council. Mr. Hooley has accepted a commission with the 8th Sherwood Foresters, Reserve Battalion, stationed at Newark, and this is doubtless primarily the reason for his retirement, which has been received with considerable regret in the county.

Mr. Hooley was appointed to the position of county surveyor in 1890 out of nearly 160 candidates, and his professional activities have been continuous ever since. He has been a warm advocate of direct maintenance of main roads, and has had all the main roads of Notts, excepting those claimed under Section II. of the Act of 1888, in urban districts, under his management. His services as an expert have been sought in almost every main roads case, either in the Law Courts or before inspectors of the Local Government Board, within the last seventeen years. With his then chief assistant, Mr. J. Sander, he designed and built the new county asylum for Notts, and he has been engaged on many engineering schemes of railway and water developments affecting the county of Notts.

Mr. J. C. Haller, the assistant surveyor, has been temporarily appointed as county surveyor, and it is understood that the Highways Committee will take steps to fill the vacancy.

Tar-spraying and Horses.—At the meeting on Wednesday of the West Riding County Council the chairman of the Highways Committee promised to give consideration to a suggestion by a member that, in the tar-spraying of roads, a space of 5 ft. should be allowed on each side of the spray for the benefit of the horses.

Lostwithiel Borough Surveyor and Sunday Work.—At a meeting recently of the Lostwithiel Town Council the borough surveyor, Mr. J. Knight, was asked to prepare a revised plan for the rebuilding of Victoria-place. He replied that he had not got the time. He had to work on Sundays now. The mayor, Mr. J. H. Jeffrey, said that if the borough surveyor had to work on Sundays he should complain to the council. He was sorry to hear any public official say that he had to work Sundays.

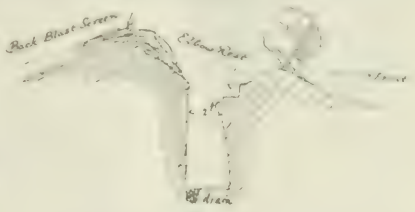
CORRESPONDENCE.

[illegible]

EARTHWORKS.

To the Editor of THE SURVEYOR.

SIR,—In his interesting paper upon "Earthworks" in your issue of the 8th inst., Mr. Hartfree suggests the use of certain obstacles—among others, tarred straw and leaves. May I mention that dead gorse passed through a chaff-cutter and sprinkled over the ground is an excellent deterrent both to two-footed and four-footed vermin? Further, it is often easily obtainable, and a chaff-cutter can generally be obtained from a neighbouring farmhouse. Chopped gorse is an old keeper's remedy for poachers using nets, as it rolls the nets into a rope in a very few



minutes. The accompanying rough sketch of a fire trench may be of interest to Mr. Hartfree; the original idea was explained to me by a military friend some weeks ago.

It appears that the "back-blast" of the enemy's shells falling to the rear of the trenches has caused many double ruptures to the men in front in the trenches. The high mounds to the rear of the trenches are for the purpose of deflecting the blast over the heads of the defenders of the trench.—Yours, &c.,

G. BERTRAM KERSHAW, M.AM.SOC.C.E., &c.

9 Victoria-street,
Westminster, S.W.
January 9, 1915.

SURVEYORS' SALARIES.

To the Editor of THE SURVEYOR.

SIR,—Your contributor of "Things One Would Like to Know" has evidently not studied what the effect would be if his recommendation of £20 to £1,000 of population were carried into effect. Under such a scheme the surveyor of Bexhill would get only £300 a year while the surveyor of Leeds would be entitled to £8,900 a year, and the surveyor of Liverpool about £15,000 a year. Although there may be officials in this country receiving salaries as big as this, it is doubtful if municipal authorities could be found capable of rising to the occasion.

May I suggest to your contributor to try rateable value?—though even then he would fail. I don't think any scale can be found to fit all cases.—Yours, &c.,

CONSTANT READER.

January 12, 1915.

To the Editor of THE SURVEYOR.

SIR,—In your issue of January 1st the writer of the bright "Things One Would Like to Know" asks for opinions as to basing the pay of surveyors on the populations of their districts, and as to how £20 per annum per thousand would work out. Well, I should say hopelessly badly. To take one instance. The urban district council of Ruislip-Northwood, in Middlesex, governs a population of some 7,000, which would give the professional man who acts as its engineer the clerkly wage of £140! No, Sir, this wouldn't do, nor, I think, would this idea work as a general principle, even if it were qualified with a compulsory *minimum*, of, say, £200 a year. There is no real relation between population and the engineering skill and work necessitated, but the arguments *pro* and *con* are too long to enter upon here.—Yours, &c.,

THE OLD SCREW.

January 11, 1915.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions: -

450. Masonry Dam. The inner face of a masonry dam is a plane vertical surface 12 ft. in height. The section of the dam is a right-angled triangle, 9 ft. wide at the base, and the weight of the masonry is 125 lb. per cubic foot. When the reservoir is filled to the upper edge of the dam, find the point at which the resultant pressure intersects the base. (A.M.I.C.E.)

451. Hydraulics.—Sketch a practical form of hydraulic ram for raising automatically to a considerable height a portion of any volume of water derived from a lesser height, and explain the points upon which satisfactory working depends.

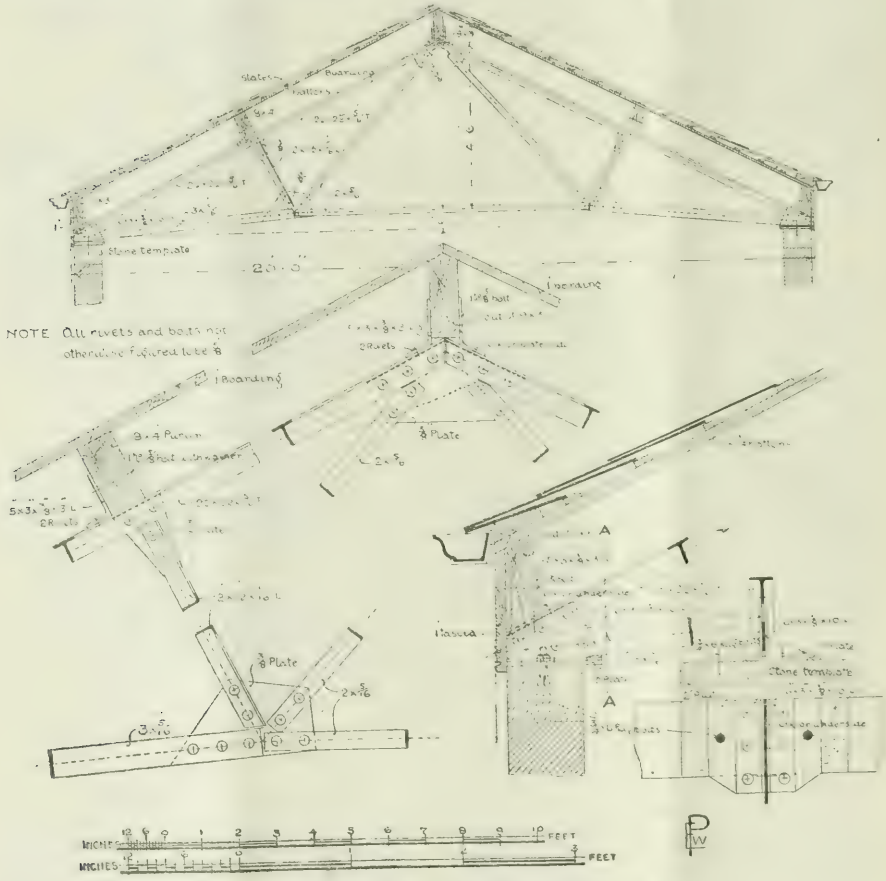
452. Wells.—What are—(1) A deep well, (2) a shallow well, (3) an artesian well, and (4) an Abyssinian well? Give definitions. (G. C., *Wigston Magna*.)

453. Building Construction.—Draw a section showing the construction of a flat asphalted roof, carried on timber joists 10 in. by 2½ in., ceiled below, the walls to be of 14 in. brickwork, [illegible] 9-in. parapet, 2 ft. high, coped with stones, the section to run across the joists and through the parapet walls. ("Ajax.")

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

449. Roof Truss.—Sketch a light iron roof truss for a span of 20 ft., and give enlarged details of the joints.



Steel Roof Truss: 10-ft. Centres
(Reply to Question 449.)

(E. W. P., *Southampton.*)

445. Cement Testing.—Sketch and describe the apparatus necessary for conducting the bushel weight and specific gravity tests for Portland cement.

It is often specified that cement shall weigh 112 lb. to 115 lb. per bushel. It is better practice to specify that the cement shall have a definite "specific gravity," the value being 3·10. Cement which has been imperfectly burned, or which has deteriorated through exposure to the atmosphere, and thus lost its power of combining with water,

[illegible] to have a specific gravity smaller than that of good cement. It is, however, questionable whether the specific gravity test is an indication of proper calcination.

The specific gravity [illegible]

$$\frac{\text{Weight of a given volume of cement}}{\text{Weight of same volume of water}}$$

or, more simply, [illegible]

$$\frac{\text{Weight of cement in grammes}}{\text{Volume of displacement in cubic centimetres}}$$

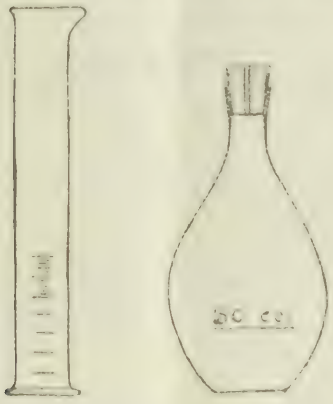


FIG. *a*. FIG. *b*.

The specific gravity may also be ascertained by means of a specific gravity bottle, which consists, as a rule, of a 50 cubic centimetres when filled to the [illegible] as in the illustration (see Fig. *b*). Weigh the bottle and stopper, then add a quantity of cement and weigh again. The difference gives the weight of cement added. Fill the bottle with water and replace the stopper so that the [illegible] cubic centimetres, and weigh again.

Subtract the weight of the bottle and cement. This gives the weight of water added in grammes, also the volume in cubic centimetres. The volume of cement is thus—50 cubic centimetres minus the volume of water added.

The specific gravity equals

$$\frac{\text{Weight of cement (grammes)}}{\text{Volume of cement (cubic centimetres)}}$$

W. R. H., *Waltham Cross*.

PROFESSIONAL MEN AND THE WAR.

WAR OFFICE STATEMENT.

The Secretary of the War Office announces that owing to the very great number of offers of assistance and applications for employment received from civil and mechanical engineers, architects, and surveyors, it has been found impossible to acknowledge letters individually.

Should an opportunity arise for utilising the services of any applicants, they will be communicated with, but the number of applications received far exceeds the probable requirements.

Whitby Spa Purchase.—In the course of the last meeting of the Whitby Urban Council a letter was read giving the Local Government Board's sanction to the borrowing of money for the purchase of the West Cliff Spa grounds and buildings, and notifying that an inquiry would be held on the 14th inst. into the council's application to borrow a further £10,650 for the development and improvement of the grounds and buildings.

PRO PATRIA.

[EIGHTEENTH LIST.]

We present herewith the eighteenth list of municipal engineering and sanitary officials who are to take part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

[illegible] Dr. J. [illegible] Sanitary Inspector, Newcastle-upon-Tyne, [illegible] Division.

Attwell, P., clerk, sanitary department, Kettering Urban District Council, 2nd Lieutenant, Army Service Company, R.A.M.C.

Bird, C. W., second assistant surveyor, Kettering Urban District Council, 7th Battalion Northamptonshire Regiment.

Bond, G., pupil, surveyor's department, Kettering, trooper, Northamptonshire Yeomanry.

Callis, clerk, Kettering Urban District Council, Northamptonshire Regiment.

Dunbavand, Eustace, borough surveyor's department, West Hartlepool, Second Lieutenant, R.E.

Firth, Chas., borough engineer and surveyor's department, Hampstead, sergeant, 1st London.

Kennedy, T. A., assistant surveyor, Redcar Urban District Council, Northumberland Divisional Cycling Company, No. 6 Platoon, for active service.

Lyles, C., assistant, rate collector's department, Kettering, 5th Battalion, Northamptonshire Regiment.

McRae, F. N., borough engineer and surveyor's department, Hampstead, sergeant, City of London.

Palmer, J. C., assistant sanitary inspector, Kettering, corporal, 9th Battalion East Surrey Regiment.

Percival, S. C., chief assistant, county architectural department, Northants, Sub-Lieutenant, 7th Northants Regiment.

Pilling, E., chief assistant, surveyor's department, Lytham Urban District Council, 7th Battalion, Manchester Regiment, Territorials.

Willett, Hugh, chief assistant, county roads and bridges department, Northants, corporal, 7th Northants Regiment (Lord Kitchener's Army).

Williams, D., borough engineer and surveyor's department, Hampstead, [illegible] company, R.A.M.C.

Mr. [illegible] Mayne and Elliott, [illegible] county surveyor of Northants, who was formerly a member of the firm, left this week for Singapore to take up an appointment as assistant on the Tebrau estates, Johore (Malay States), and joined King Edward's Colonial Horse, [illegible] 7,000 miles to fight [illegible]

ASSOCIATION OF SOMERSET SURVEYORS.

ANNUAL GENERAL MEETING.

The annual general meeting of the Association of Somerset Surveyors will be held at the Merchant Venturers' College, Bristol, on the 23rd inst., when the following business will be transacted: (1) The election of president and officers for the ensuing year; (2) to ballot for the election of members on the Executive Committee; (3) president's address; (4) presentation of premiums; (5) any other business.

The president-elect—Mr. F. W. Jones, ASSOC.M. INST.C.E., engineer and surveyor, Frome—invites all members to tea at the conclusion of the business. Subsequently, a short convivial gathering will take place, and all members are requested to assist in this direction.

Water Supply at Reading.—In its review of local activities during 1914 the *Reading Observer* notes that the Candy installation of filters at the Southcote works of the Reading Corporation waterworks continues to be visited by engineers from all parts of the country, adding that a further testimony to the efficiency of the system is that the War Office have recently adopted it for the purification of the water supply to the troops encamped on Salisbury Plain. Mr. H. G. Dadley and Mr. Bryne, members of the staff of the waterworks manager and engineer, Mr. Leslie Walker, have joined the army, and are now in France, the first named in the Royal Flying Corps, and his colleague in the Army Ordnance Corps.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Cowes U.D.C. (December 29th. Mr. P. M. Crosthwaite). £4,000 for a scheme of water supply.—It was stated that the proposed works included the following items: Cornish boiler, 24 ft. long by 5 ft. 6 in. in diameter, including provision of new foundations, £520; horizontal compound surface condensing engine, £850; one set of 10-in. treble well pumps, including gun-metal buckets and foot valves, steel standpipes, girders, and fixing complete, £1,920; alterations to top of well shaft, foundations for engine condenser pit, &c., £210; electric lighting plant for engine house and well work, including wiring, £150; 280 lin. yds. 8-in. water main for No. 4 reservoir to filter-house in Newport-road, £155; contingencies, £195; total, £4,000. Mr. Damant said that No. 1 plant yielded 8,000 gallons per hour, and No. 2 plant 25,000 gallons per hour. The surveyor, Mr. J. W. Webster, in submitting the details, stated that No. 2 plant had been running night and day for the last ten years, and had given great satisfaction. No. 1 plant was of weak design and construction, and it could not be relied upon. The nominal capacity was 10,000 gallons, but it was difficult to keep it running at 8,000. Plant No. 2 lifted 25,000 gallons per hour, and the proposed new machinery was estimated to lift 18,000 gallons. He considered it was necessary to get this plant at work by the end of June.

Rotherham R.D.C. (December 31st. Mr. A. W. Brightmore).—£862 for sewerage purposes, and £655 for water supply in the parishes of Brampton-en-le-Morthen and Laughton-en-le-Morthen.—Mr. J. H. Pickford, on behalf of the council, stated that it was proposed to lay a sewer in the parish of Laughton that would also serve the parish of Brampton-en-le-Morthen. This work was necessitated by the erection of property. Two other lengths of sewer were to be laid in Ridding's-lane, Laughton, for prospective buildings on the east side of the colliery company's cottages in the new village. A further sewer was projected in Catherine-street, rendered necessary by reason of the schools. Regarding the water mains, the conditions were precisely similar. The inspector held an inquiry on the following day into an application by the same council for sanction to a loan of £353 for sanitary improvements at Maltby. Replying to an objection that there was an insufficient supply of water at the present time, Mr. Pickford said it was understood a reservoir was about to be constructed, and this would probably improve matters.

York T.C. (January 5th. Mr. H. R. Hooper).—£19,000 for the electricity undertaking, to be allocated as follows: £11,400 for mains; £1,700 for services; £800 motors, £500 buildings for sub-generating station, £4,400 for plant, and £750 for transformers.—The town clerk, Mr. P. J. Spalding, said the council would like twenty-five years for the repayment of the amount borrowed for the buildings. The inspector: That means that every £1,000 borrowed costs you £2,500 before it is paid off. A shorter period is better, so as to get rid of paying interest as soon as you can for the benefit of the undertaking. What have you got to reserve fund? The city treasurer: Practically only £55. We have been paying off several items out of the reserve fund; for renewals, and so on, in the last years we have spent £7,000. The inspector: But out of that you have scrapped a lot of plant, it doesn't add to the assets to take it from the reserve. What have you done with the profits of last year, which were about £800? The city treasurer: We brought forward a surplus balance of £1,785, and with the year's profits it gave us a total of £2,867, and out of that we paid an outstanding liability of £2,812. The inspector: So really you have got no money at all. You hope, apparently, that everything will go on normally until you have got something. Fifty-five pounds is practically nothing on a capital of £200,000. The city treasurer replied that the sinking fund was very heavy; they were paying over £12,000 a year.

APPLICATIONS FOR LOANS.

Aldershot U.D.C.—£800 for workmen's dwellings.

Ashton-under-Lyne T.C. £20,400 for a secondary school.

Clacton U.D.C.—£1,205 for a new battery for the electricity works.

Darlington T.C.—£18,500 for new electrical plant.

Doncaster R.D.C.—£1,063 for the Askern sewage disposal scheme, and £3,000 for sewage disposal at Barmborough.

East Stow R.D.C.—£1,188 for the erection of three pairs of cottages.

Harrogate T.C.—£1,000 for the electricity undertaking.

Limerick T.C.—£5,000 for additional electrical plant and machinery.

Lower Bebington U.D.C.—£350 for public conveniences.

Swansea R.D.C.—£900 for works of sewage disposal.

Swindon T.C.—£2,640 for new trunk water mains.

Taunton T.C.—£3,450 for the erection of public baths.

Wakefield T.C.—£3,295 for the Westgate improvement.

LOANS SANCTIONED.

Arnold U.D.C.—£3,700 for the purchase of a site for a public park.

Barnet R.D.C.—£4,907 for the provision of workmen's cottages.

Broadstairs U.D.C.—£280 for drainage works.

Kirkby-in-Ashfield U.D.C.—£5,500 for a gasholder.

Romford U.D.C.—£11,288 for wood paving, £9,616 for foundations, setts, and kerbing, and £4,184 for sewerage works.

Runcorn U.D.C.—£270 for making up a road.

Wanstead U.D.C.—£580 for erecting a cottage and making an approach road to the isolation hospital.

Waterford T.C.—£23,138 for a housing scheme.

Wigan T.C.—£2,000 for conversions to the water-carriage system.

Wokingham T.C.—£3,150 for the gas undertaking.

Wolverhampton T.C. — £12,031 for workmen's dwellings.

Wrexham R.D.C.—£11,000 for the erection of houses at Rhos.

London Lighting.—It is estimated by the St. Marylebone Electricity Department that, as a result of the street lighting restrictions, the output at their works is less by 10 per cent to 20 per cent per day.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear in the Buildings, Barrow Rail, Bradford Notice St., Sowerby Bridge, Sanitary and Town Planning, Wakefield, roads and materials, Lancaster, Norwich, Harrogate, sewerage and sewage disposal, New Mill, water, gas and electricity, Greenock, Lanchester. Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Banbury T.C. It has been decided to carry out alterations to the town hall at an estimated cost of £900.

Barrow T.C. It was reported on Monday that the Carnegie Trustees had agreed to increase their gift of £12,000 to £15,000 for a new free library, and the donors were cordially thanked for their handsome gift.

Bath T.C.—The question of making alterations at the bathing establishment is under consideration. The estimated cost of the proposed works is £20,000.

Bradford T.C.—It is intended to provide public baths at Five Lane Ends, at an estimated cost of £9,762.

Doncaster T.C. Plans are being prepared for a police station and mortuary at Balby.

Essex C.C. Revised plans have been approved for extensions to the sanatorium at Black Notley, which are estimated to cost £1,500.

Hull T.C.—The Bridges Committee last week resolved to postpone for three months any further progress with the scheme for rebuilding the North Bridge.

Nelson T.C.—An amended scheme for public abattoirs has been approved.

Sheffield T.C.—The Watch Committee recommend the council to apply for sanction to borrow £4,067 for the extension of the chief fire station in Rockingham-street.

Sowerby Bridge U.D.C.—Plans have been approved for rebuilding the public baths at an estimated cost of nearly £5,000.

Surbiton U.D.C.—The council on Monday accepted the tender, the lowest of ten, of Messrs. Myall Brothers, Southend-on-Sea, at £2,021, for the erection of the chapel, lodge, office, &c., at the new cemetery. This sum includes £39 extra for terra-cotta instead of Bath stone, Mr. Bannan, the architect, considering that the latter might be affected by fumes from the destructor chimney.

Taunton T.C.—The borough surveyor, Mr. D. Edwards, has prepared a scheme for the provision of public baths, at an estimated cost of £3,450, including the cost of the site.

Warrington T.C.—The borough surveyor, Mr. A. M. Ker, has received instructions to prepare plans and estimates for an isolation hospital at Pear Tree Farm.

HOUSING AND TOWN PLANNING.

Ballycastle R.D.C—A letter has been received from the Local Government Board urging the council to deal with the insanitary areas of the town.

Bangor T.C.—It has been decided to purchase land from the Penrhyn estate at 4s. per square yard for the purpose of erecting additional workmen's dwellings.

Brixham U.D.C.—The Public Works Loan Commissioners have granted a loan of £3,810 for carrying out the housing scheme, to be repaid with interest at 4 per cent per annum, by half-yearly instalments, in sixty years, as regards £3,410, and eighty years for the remaining £400.

Ludlow T.C.—The Local Government Board have approved the council's housing scheme with a few alterations, and recommend that the building of twenty-two houses should be proceeded with.

Wednesbury T.C.—The council on Monday resolved to erect forty-eight working-class houses, and to apply to the Local Government Board for a loan of £10,200 to meet the cost of the scheme. The houses will have two rooms downstairs, and three bedrooms, and each tenement will have garden ground extending back 45 yds. The houses will be built in pairs with varying elevations, and they are to be let at 5s. 3d. a week.

REFUSE COLLECTION AND DISPOSAL.

Fowey T.C.—It has been resolved to terminate the agreement with the scavenging contractor, and to consider the question of doing the work by direct labour.

ROADS AND MATERIALS.

Bermondsey B.C. Arrangements are completed with the London County Council for the reconstruction of the tramway from Grange-road to Rotherhithe New-road. It is estimated that the cost of the tramway work alone will amount to £74,700. Of this sum £62,500 will be expended on trackwork, the cost of additional cars will amount to £6,650, the cables and ducts will cost £5,450, and additional plant at the sub-station will cost £100.

Blackburn T.C.—Plans have been approved for a number of new streets.

Carshalton U.D.C. Tenders are being invited for making up a number of new streets.

East Grinstead U.D.C.—The surveyor, Mr. W. E. Woollam, has received instructions to prepare plans, specifications, and apportionments for making up a number of roads in Park-road district.

Fifeshire C.C. A sub-committee of the County District Committee have recommended that with the object of carrying out in a more improved and economical manner the surface improvements, for which a grant of £7,000 has been made, the committee should purchase tar-mixing and road-rolling plant, consisting of a Koehring tar mixer, three tanks and sprayers, and a workmen's van, the total cost being £1,440.

Grimsby T.C.—The legal difficulties in connection with the Weelsby-road improvement scheme have been satisfactorily overcome, and the work will be put in hand as soon as possible.

Limerick T.C. In order to provide work for the unemployed the council have resolved to apply to the bank for a loan of £7,150 for completing the block paving of the streets.

Little Lever U.D.C.—The council are giving consideration to a scheme for the provision of a new main road from Bury-road, Ainsworth, through Little Lever and across the valley to Moses Gate.

Lostwithiel T.C.—The County Main Roads Committee having intimated that they were prepared to consider plans for widening the approaches to the town, the Street Committee recommended the taking off of the dangerous corner at the foot of St. Austell-road.

Marlborough T.C.—An additional estimate of £664 has been agreed to for granite for the London to Bristol main road.

Newcastle (Ireland) R.D.C.—The council have agreed to a proposal to construct about 8 miles of new road between Cushendun and Ballycastle, at an estimated cost of £11,000. It is hoped to obtain the greater part of the money from the Road Board and the county council.

Newhaven U.D.C.—The tender of Mr. W. J. Burstow, Brighton, at 6.365 has been accepted for the surfacing of roads for military traffic.

Southgate U.D.C. During the three years ended October, 1914, the sum of £865 has been expended by the council on trees in streets. The number of new trees planted was 1,864. This sum of £865 includes the purchase of trees, stakes, wire-netting, cord, and binders, planting new trees, and the maintenance of both new and existing trees.

Swansea R.D.C.—Consideration is being given to a scheme for a new road from Gowerton to Penclawdd.

Tipton U.D.C.—The surveyor, Mr. W. H. Jukes, has received instructions to prepare plans and specifications for making up Hurst-street.

Winchester T.C.—The council have agreed to a scheme for widening Bridge-street, at an estimated cost of £2,130.

SEWERAGE AND SEWAGE DISPOSAL.

Bexhill T.C.—The Sanitary Committee on Monday reported that the Local Government Board had refused to sanction a loan of £360 for storm-water overflow work at Cooden. The committee therefore recommended that the work should be proceeded with, the money to come directly from the rates. Replying to Councillor Coppard, the mayor said the Local Government Board were being communicated with in regard to the legality of the proposed step.

New Mills U.D.C.—The council have under consideration a sewerage scheme for Hague Bar, the estimated cost of which is £2,300.

Reading T.C.—The borough surveyor, Mr. J. Bowen, has been instructed to prepare a report upon the proposed sewerage works in Basingstoke-road, Whitley Wood-lane, and Whitley Wood-road.

Stratford-on-Avon R.D.C.—Difficulties have arisen with respect to a proposed scheme of sewerage for Claverdon, which is estimated to cost £3,000. The council last week agreed again to negotiate with the parish council with a view to arriving at an amicable settlement.

Wantage R.D.C. A scheme has been adopted for dealing with the sewage of Charlton on land to be leased from the county council.

WATER, GAS, AND ELECTRICITY.

Barnoldswick U.D.C.—It is proposed to provide a water supply for Elslock.

Billinge U.D.C. The tender of Messrs. A. Kyle & Sons has been accepted for making a borehole.

Coventry T.C.—The nett profit of the electricity undertaking in the last financial year was £1,687.

Doncaster R.D.C.—A scheme has been prepared and submitted to the Local Government Board of a water supply for Adwick-le-Street.

Essex C.C.—An estimate of £350 has been approved for the construction of a water tank to hold 100,000 gallons at the Severalls asylum.

Greenock T.C.—Official sanction has been received to an expenditure of £30,000 upon the electricity undertaking.

Hucknall U.D.C.—The General Purposes Committee have appointed a sub-committee to go into the question of electric power and lighting.

Londonderry T.C. The council have adopted a resolution in favour of a filtering scheme for the water supply.

Ripon T.C.—The council have consented to construct a water supply to the military camp provided the War Office bear the cost, estimated at £1,000, for a new filter bed, and also pay £100 a year for filtering

Walsall T.C.—It has been decided to light with electricity the new street which is being constructed to improve the approach to the town from the Birmingham-road.

MISCELLANEOUS.

East Grinstead U.D.C.—The surveyor, Mr. W. E. Woollam, has been instructed to prepare a scheme for laying out the new cemetery.

Lees (Lancs) U.D.C.—The council recently in committee considered the question of making application to the Local Government Board for sanction to borrow the monies necessary for the provision of stables, horses and carts, to enable the council to undertake their own team labour.

Southgate U.D.C. The General Purposes Committee has been instructed to consider and make a recommendation to the council on the entire subject of filling the vacancy in the office of surveyor to the council, and the terms of any fresh appointment.

Institution of Civil Engineers.—We learn that Messrs. B. Hall, municipal engineer's office, Singapore, A. Burton, borough engineer, Stoke-on-Trent, F. W. Lawson, assistant engineer, sewerage branch P.W.D., Perth, Western Australia, and L. Roseveare, borough engineer, South Shields, have been transferred from the class of associate member to that of member of the Institution of Civil Engineers. Messrs. H. H. Bradshaw, borough surveyor's office, Rochdale, G. L. W. Butterworth, district surveyor's office, Birchington, Kent, J. H. Clarke, town hall, Lancaster, W. H. Duckworth, council offices, Watford, M. H. Shorto, P.W.D., Municipal Council, Shanghai, and S. T. Stubbs, Rangoon Municipality, have been elected associate members; and Mr. W. H. Pike, county surveyor's office, Nottingham, has been admitted as a student of the institution.

PERSONAL.

Mr. Arthur Kilburn, Leeds, has been appointed manager of Roall waterworks by the Pontefract Corporation.

Mr. W. W. Squire, engineer-in-chief of the Bristol Docks, died, we regret to state, on Monday last. He had held office since 1899.

Mr. S. Stead has been appointed city surveyor *pro tem.* of Ripon, in the absence of the city engineer and surveyor, Mr. A. Barlow, on military service.

Mr. Wm. Frank Gardner, who served his articles under Mr. J. W. Hipwood, ASSOC.M.INST.C.E., borough engineer of Morecambe, and is now assistant surveyor to the Earby Urban District Council, has been appointed assistant surveyor under the Derby Corporation.

Mr. Stanley Empsall, of the urban district council offices, Bentley, Mr. Aubrey Glyn Evans, of the borough engineer's office, Neath, and Mr. Bernard Robson, A.R.I.B.A., of Hull, have been appointed town planning assistants in the office of Mr. H. Gilbert Whyatt, M.INST.C.E., borough engineer and surveyor, Grimsby. Three town planning schemes are to be dealt with, covering an area of 13,000 acres.

Mr. A. P. I. Cotterell, M.INST.C.E., the new president of the Institute of Sanitary Engineers, is a consulting engineer practising in Westminster and Bristol. He was formerly engaged on works of railway construc-

MR. A. P. I. COTTERELL, M.INST.C.E.,
President of the Institute of Sanitary Engineers.

tion in the West of England, among these being the Exe Valley Railways, Teign Valley Railway, and the Helston Railway. Since commencing private practice, he has designed and carried out numerous sewage and water undertakings, for, among others, the towns of Surbiton, Harpenden, Bristol (suburbs), Gillingham, Minehead, Street, Glastonbury, Launceston, and St. Ives. At present he has works in hand in South Wales and the West of England, and is also consulting engineer to the Poole Corporation waterworks. Mr. Cotterell was at one time Lecturer in Sanitary Engineering to the University of Bristol, and was for some years a member of the corporation of Bristol. Business claims, however, compelled him to relinquish the latter office. He is a Fellow of the Surveyors' Institution and of the Royal Sanitary Institute, an associate of the Society of Medical Officers of Health, and a past-president of the Bristol Association of Engineers.

We deeply regret to report the death, which occurred at her residence, 5 Gwendolen-avenue, Putney, S.W., on Saturday last, of Mrs. Shone, wife of Mr. Isaac Shone, the well-known engineer and sanitarian. Mrs. Shone was in her eighthieth year.

H. E. AMES,
Clerk.

The Public Offices,
Christchurch-street West,
Frome.
January 12, 1915. (2,255)

BECKENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The Beckenham Urban District Council invite Tenders for the making up of St. George's-road, Beckenham. The works comprise the supply and laying of about 400 lin. yds. granite kerb and channelling, 360 cub. yds. of hardcore, 200 cub. yds. field flints, 700 super. yds. of tar-paving, and other incidental works.

Plans and Sections may be seen, and Bills of Quantities, Specifications and Forms of Tender obtained, on application to Mr. John A. Angell, Surveyor, on and after January 11th, on the production of a receipt from the Collector for a deposit of £2, which will be returned on the receipt of a *bonâ-fide* Tender.

A clause will be inserted in the Contract providing that the Contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, and (2) to the extent of 75 per cent at least of the staff required in the execution of such works, give preference to and engage such competent workmen of the class required as may be *bonâ-fide* residents in the Parish of Beckenham, and may offer themselves for employment.

Payment under the Contract will not be made until six months after the completion of the works.

Tenders, duly sealed and endorsed "Tenders for Street Works," to reach undersigned not later than 4 p.m., Monday, January 25, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

F. STEVENS.
Clerk of the Council.

January 6, 1915. (2,234)

BECKENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The Beckenham Urban District Council invite Tenders for (*a*) the culverting of stream between Cromwell and Hampden Roads, and (*b*) the construction of a culvert under Cedars Road.

The works include some 270 cub. yds. of cement concrete, and 400 cub. yds. of excavation.

Plans and Sections may be seen, and Bills of Quantities, Specifications and Forms of Tender obtained, on application to Mr. John A. Angell, Surveyor, on and after January 11th, on the production of a receipt from the Collector for a deposit of £1, which will be returned on the receipt of a *bonâ-fide* Tender.

A clause will be inserted in the Contract providing that the Contractor shall (1) pay to the employees the wages generally accepted as current for workmen engaged on similar work in the town where the work is executed, and (2) to the extent of 75 per cent at least of the staff required in the execution of such works, give preference to and engage such competent workmen of the class required as may be *bonâ-fide* residents in the Parish of Beckenham, and may offer themselves for employment.

Tenders, duly sealed and endorsed "Tenders for Culverts," to reach undersigned not later than 4 p.m., Monday, January 25, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

F. STEVENS.
Clerk of the Council.

January 6, 1915. (2,235)

HERTFORDSHIRE COUNTY COUNCIL.

LONDON-ROAD, BUSHEY.

WOOD AND GRANITE SETT PAVING.

The Highways Committee of the County Council invite Tenders for Laying London-road, Bushey (between the Middlesex County Boundary and the Watford Urban District Boundary) with Creosoted Deal Paving (approximate area 31,000 sq. yds.), and a short length with Granite Sett Paving (approximate area 3,000 sq. yds.).

Persons desiring to Tender for the Work may see the Drawings, Specification, Agreement, &c., at the County Surveyor's Office, Hatfield, on or after Monday, 18th January, 1915, between the hours of ten a.m. and four p.m., except on Saturdays, when they may be seen from ten a.m. till twelve noon.

A copy of the Schedule of Works and a Form of Tender can be obtained at the County Surveyor's Office upon payment of Two Guineas, which sum will be returned to the Tenderer upon receipt of a *bonâ-fide* Tender and the documents which have been supplied to him.

Sealed Tenders, endorsed "Tenders for Wood Paving, Bushey," must be delivered to the undersigned at his Office, not later than 12 noon on Saturday, 30th January, 1915.

Such security for the due execution of the works as the Council may require must be given by the Contractor.

The lowest or any Tender will not necessarily be accepted.

J. S. KILLICK.
County Surveyor.

County Surveyor's Office,
Hatfield.
January 12, 1915. (2,259)

METROPOLITAN BOROUGH OF STEPNEY.

The Council of the Metropolitan Borough of Stepney hereby invite Tenders for Contracts for one year, from 31st March, 1915, as follows:—

(1) Supply of Bricks, Lime and Fireclay.
(2) Supply of Cast-iron Work.
(3) Supply of Colours, Varnishes, Painters' Brushes, &c.
(4) Supply of Drainage Materials.
(5) Supply of Oilman's Goods.
(6) Supply of Portland Cement.
(7) Supply of Pitch, Bitumen, Tar and Green Oil.
(8) Supply of Timber.
(9) Supply of Tools, Implements and Ironmongery.
(10) Supply of Uniform Clothing.
(11) Supply of Boots.
(12) Chimney Sweeping.
(13) Clock Winding, &c.
(14) Window Cleaning.
(15) Supply of Disinfectants.

Persons tendering must submit the names and addresses of two substantial persons willing to be jointly and severally bound for the due and proper performance of their several Contracts.

Contractors will be required at all times during the existence of their Contracts to pay the Trade Union rates of wages as agreed to by the Employers' Associations and Trade Unions, and as in practice obtain.

Contractors will also be prohibited from assigning or underletting their Contracts without the written consent of the Council previously obtained.

Forms of Tender, Specifications, Stipulations, and other Conditions for items numbered (1) to (9) inclusive may be obtained upon application to the Borough Engineer (Mr. M. W. Jameson, Assoc.M. Inst.C.E.), at the Municipal Offices, No. 15 Great Alie-street, Whitechapel, E., on and after Thursday, the 14th January, 1915, between the hours of ten and twelve a.m., upon deposit of a £5 Bank of England note in respect of each Tender.

Forms of Tender and Specifications for items numbered (10) to (15) inclusive may be obtained upon application to the undersigned at the Municipal Offices, No. 15 Great Alie-street, Whitechapel, E., on and after Thursday, the 14th January, 1915, between the hours of ten a.m. and twelve noon, upon deposit of £1 in respect of each Tender.

The deposit will in each case be returned upon receipt of a *bonâ-fide* Tender, together with the other documents.

Tenders must be enclosed in the envelopes to be provided by the Council, and sent to the undersigned on or before noon on Saturday, the 23rd January, 1915.

The Council do not bind themselves to accept the lowest or any Tender, and will not accept the Tender of any person or firm who on any previous occasion has withdrawn a Tender after the same has been opened, unless the reasons for the withdrawal were at the time satisfactory to the Council, and the Council, moreover, reserve to themselves the right of dividing the contract between one or more of the persons tendering.

(By order)

GEO. W. CLARKE.
Town Clerk.

EXTENSION OF MAIN SEWERAGE: CONTRACT No. 2.

TO SEWERAGE CONTRACTORS.

The Corporation of the City of St. Alban, acting as the Sanitary Authority for the said City, are prepared to receive Tenders for certain works in connection with alterations and additions to the Sewage Disposal Works, near Park-street, on the outskirts of the City of St. Alban.

The works generally will consist of the construction of Concrete Sedimentation and Humus Tanks, Primary and Secondary Bacteria Beds, necessary Drains, Connections, &c., extension of Buildings, and alteration to existing Bacteria Beds, &c.

Particulars, Bills of Quantities, and Forms of Tender may be obtained, and Plans may be seen, at the office of the Consulting Engineer, Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, after the 8th day of January, 1915, between the hours of 10 a.m. and 4 p.m.

Intending Contractors will be required to deposit a sum of Three Guineas prior to particulars being furnished, such sum being returned after the Corporation have come to a decision on the Tenders received, provided that the Contractor shall have sent in a *bonâ-fide* Tender, and shall not have withdrawn the same.

The successful Tenderer will be required to execute a Contract the draft of which may be seen at the offices of the Consulting Engineer aforesaid.

Tenders must be on the official form, each Tender in a sealed envelope (which will be provided by the Engineer).

Contractors must, with the Tender, return the Bill of Quantities and Schedule of Prices duly filled in in detail, and signed in the handwriting of the Tenderer or his authorised Agent.

Tenders must reach the undersigned not later than noon on the 27th day of January, 1915. The Corporation do not bind themselves to accept the lowest or any Tender.

Given under my hand this 4th day of January, 1915.

Vol. XLVII. JANUARY 22, 1915. No. 1,201.

Minutes of Proceedings.

Engineering and Publicity.

[illegible] Mr. [illegible] read to the Municipal Engineers' Society, Philadelphia, a paper on "Engineering and Publicity," which was discussed at the meeting of the Department of Public Works, Philadelphia. Among the points dealt with in the paper were the relations of the engineer to the community and public opinion, and the [illegible] by the engineer. Mr. Cooke [illegible] that the engineer [illegible] to be a [illegible] and that in every decision and act there shall be the [illegible] of the public welfare. [illegible] engineer [illegible] can doubtless result from this [illegible] engineer might [illegible] actions which have not only [illegible] undergone examination, but which [illegible] and in many cases [illegible] It is [illegible] from [illegible] that, broadly speaking, the test by which the ultimate position of the municipal engineer will be determined is the competence in the profession of a [illegible] part of public [illegible] In regard to the position of consulting engineers, it appears that in America, as here, some difficulty is felt with regard to the connection which [illegible] with manufacturing firms. As an illustration of this, Mr. Cooke quoted the case of an eminent authority on concrete, in intimate touch with the most progressive in the [illegible] who recently asked the chairman of an engineering firm was not in any way connected with the [illegible] manufacture of this material, and after considerable thought was able to think of [illegible] man. Although we agree that there is nothing necessarily improper in such a state of affairs, it makes neither for the true dignity of the profession nor the confidence of the public. In this country the difficulty has largely been met by the recently established organisation of consulting engineers, and it would seem that our American confrères would do well to possess themselves of a similar association.

In the latter part of his paper Mr. Cooke made some most valuable remarks on the work of the municipal engineer in influencing public opinion. Only too frequently the engineer is in the position of an enlightened pioneer in regard to some matter of health or sanitation, whose first business it is to convince his council and the public of the utility and ultimate economy of his schemes. In other words, he must be a good advocate, and his arguments must be clear, convincing, and convincing. It is only as engineers who are able [illegible] lead the public, sometimes against its will, understand their work, that they will obtain that degree of popular support which will enable them to achieve the ends they have in view. In this country an excellent illustration is afforded in the matter of housing. [illegible] Housing [illegible] by local authorities under the Housing of the Working Classes Act, 1890, were used to anything like their full extent, and, although great strides have been made in this matter since the passing of the Act of 1909, much [illegible] remains to be done. Many [illegible] still [illegible] willing to balance the public health of their areas against pounds, shillings and pence, and to indulge in petty economies which result in the greatest harm. The business of the municipal engineer [illegible] and [illegible] although in many cases it seems an almost hopeless task, that [illegible]

Burst Water Mains.

The [illegible] of leakage and waste in a pipe system are many, and depend upon the special conditions of each district or system. In one case leakage may occur owing to corrosion of the pipes, at others the trouble may be due to defective joints, imperfect connections to services, or defects in the service pipes to houses; or again a main may fail owing to some defect in the casting or structure, which was not observed when it was laid; such defects sometimes only become apparent when a great pressure comes upon the main. An investigation of the causes of forty-two breaks in the Chicago water mains resulted in a report to the effect that the leaks or breaks in the mains were due to thirteen causes—viz.: improper design, poor material, improper handling and installation, subsidence or rise of soil, jarring from traffic, frost, temperature changes, electrolysis, corrosion, excessive static pressure, excessive momentary pressure, periodic pressure waves, and extraordinary causes. The most serious cause of breaks, however, at Chicago was found to be due to excessive momentary pressure due to water hammer. It is demonstrated that the intensity of the pressure cannot be calculated with any degree of certainty, and therefore it

cannot be provided for in the design, except approximately.

Water hammer may be caused by suddenly increasing the flow in the mains, as with the sudden starting of a pump, or by suddenly shutting off the flow at the outlet end of the main. A large consumer who suddenly shuts off the flow to his premises may thus cause sudden and undue pressure to occur in the main. Some leaks at joints were thought to be due to the jar of heavy traffic. The investigations appeared to prove that certain burst pipes were made of metal of a quality and thickness to withstand the greatest pressure that could come upon them in ordinary working. The pipes had been tested when laid to 100-lb. pressure, and the greatest pressure coming upon them in working was 41 lb. A water-hammer producer, as a testing appliance for pipe brittleness, has therefore been proposed. It comprises a plunger of small size, free to move inward a short distance towards the water in the pipe while on the testing flow. The motion outward is promoted by steps. A weight on guides is fixed to fall upon the plunger. The water under the plunger is connected to the water in the pipe, the water having a static pressure equal to the working pressure in the town main. The entire pressure can be regulated by the size of the weight and by the length of its fall.

The future policy at Chicago appears to be the testing of all pipes, fittings, and valves for strength under water hammer, to protect the mains by the installation of a number of air vessels, and to require the use of such vessels in all places where there may be quick-closing valves of a size equal to one-quarter of the area of the supply pipe, and in all cases where the supply pipe exceeds 4 in. in diameter, also to lay all mains to line and grade. Whether such elaborate precautions are necessary must depend upon the nature of the system, but undoubtedly where quick-shutting valves over 4 in. in diameter exist on mains, as is apparently the case at Chicago, special precautions must be taken. Whether the increased weight of modern traffic will exert any harmful influence on water mains in this country is doubtful. Where the foundations of the main have been disturbed by other works, there is always a likelihood of trouble arising, but it does not seem reasonable to suppose that more pressure and vibration will adversely affect good pipes properly jointed.

* * *

Roadmaking and Skilled Labour.

Under the heading of "Things One Would Like to Know," our contributor last week inquired whether surveyors throughout the country are not suffering from a lack of sufficient skilled labour for road maintenance and construction. Be the reason what it may, there is no doubt that—to use the accepted formula—this question should be answered in the affirmative. It is equally true that the inevitable result of the handling of expensive appliances and materials by unskilled workmen is an element of waste of public money. An interesting paragraph in regard to this matter appeared in the last annual report of Mr. G. H. Jack, the county surveyor of Herefordshire, in which he drew attention to the common fallacy that any sort of man will do for road work, and that little or no skill is required in its execution. He then made the striking statement that there were not in his county a dozen workmen competent to act as foremen over gangs employed in the construction of waterproof roads. The reason for this shortage of competent labour is, in our view, to be found in the comparatively low wages offered. Most highway authorities have yet to learn that a wage must be paid which will attract men who are sufficiently educated to grasp quickly the elementary scientific principles of good road-making. If this were done, the extra expense would be saved many times over in reduced cost of maintenance, both of the better-made roads and of the more carefully-used appliances. As Mr. Jack pointed out, it matters little how competent the chief surveyor or his staff may be; if the men who actually do the work are untrained and consequently incompetent, the result must be both unsatisfactory and costly. It is quite impossible to get good work out of a bad workman, however much he is supervised. Good workmanship is essential for the production of good roads, and it is well worth paying for.

* * *

Concrete Roads.

The article which we publish in another column from the pen of Mr. W. W. Crosby forms a fitting supplement to the references that have appeared in our pages of late to the use of concrete in modern road construction. At the present time the choice of a form of construction adapted to the requirements of modern traffic is a problem that is constantly before the highway engineer. The use of concrete as a surfacing material made no progress in the days when animal traction reigned supreme, mainly owing to the expense and difficulty of repair. With the advent of mechanically-propelled vehicles, however, new considerations have arisen, and the voice of the advocate of concrete is again heard. Mr. Crosby's article is based upon the hypothesis that he is speaking only of city streets on which a considerable amount of animal-drawn, hard-tyred traffic is mixed with motor vehicles on rubber tyres. For such cases a concrete surface certainly has many desirable characteristics. For example, it can be maintained without the use of any expensive mechanical appliances; it is easily kept clean; has an extraordinarily low resistance to traction; and is as sanitary as any pavement, except a bituminous one. As regards first cost, however, the figure for a concrete road is necessarily comparatively high, although the excess may in part be obviated by the use of a local stone as the aggregate. The cost of repairs too must be large owing to the necessity for cutting away the material in almost every case. The burden of Mr. Crosby's article is that the advantages of an all-concrete road can be secured without the attendant disadvantages by providing a bituminous surface on the concrete. In other words, economy in the first cost of the concrete may be effected by making it of a composition suitable for foundations, and economy in repair by the presence of the bituminous carpet.

* * *

Groynes.

The protection of our foreshores is at the same time one of the most difficult and important tasks devolving upon our engineers to-day, and the whole subject has been receiving increased attention in recent years at the hands of experts and specialists. Among these, few can speak with greater authority than Mr. A. T. Walmisley, whose [illegible] article to which reference will appear in our Special Issue next week. Some of our readers may remember that a paper by Mr. Walmisley on the subject of "Groynes" appeared in our columns as long ago as 1897. In the article of which we now write he brings the matter thoroughly up to date, and provides a large number of excellent drawings, showing details which are likely to be of considerable value to those who are concerned with foreshore protection works. The primary object of groynes is to arrest the shingle upon the windward side—an object which must be attained without producing any undue scour to leeward. They thus act in aid [illegible] natural barriers which may exist against

the denuding action of the sea. There are four rainy-point to be kept in view in their construction. They should be connected at the top and with a sea wall, carried well out into the sea, constructed only at sufficient height to retain the beach, and not to obstruct the rush of water over the beach, and provided with an inclined outer edge parallel to the steam angle of the beach. Mr. Whitelegg states these principles as illustrated by a series of eight designs showing various forms of groyne construction. As regards the material to be used, he expresses the opinion that there appears to be no merit in the adoption of reinforced concrete which may suffer from the expansion of the metal to a greater degree than the attrition of the shingle. Moreover, a concrete groyne cannot be so readily repaired as one constructed in timber.

* * *

Haworth Council and the Ventilation of Dwelling-houses.

The revolt against practically improvement in general sanitary powers generally finds a most vehement expression in a section of urban and rural councillors whose opposition is almost interested or merely the outcome of obstinate humour. Lately, the Haworth (Urban) District Council have had under consideration the problem of the open window—by no means rare in the rural districts—and it was proposed at the council meeting that a resolution passed in November last with reference to the ventilation of rooms of dwelling-houses should be extended so as to include the following: "That the window shall be fitted with cords and weights so as to allow of the top and bottom sashes being opened, or, if a casement window, it shall be made to open the full length thereof, and not less than one-half of the area of the window." The proposal, it was explained, would only apply to one window in each room. The protest there is always a more serious protest launched against such propositions—on this particular occasion assumed the usual form that the proposed resolution was unreasonable, drastic, and unworkable. There was a variant, however, upon this note in the suggestion that, owing to the high altitude of Haworth, many people had the greatest difficulty during six months out of the twelve in keeping the wind out of their rooms and keeping warm. This, of course, might point to the necessity for enforcing structural repairs to the houses, and to ensure that these shall be reasonably wind-proof, but, so far from being an argument against the ventilation of the rooms by means of the movable window, it only strengthens the case for the proposition, which, we are pleased to record, was carried by a substantial majority.

Municipal Engineers and the War.

In another column will be found an article on "Camp Kitchens," being the last of the series written for THE SURVEYOR since the outbreak of war in August last by Mr. Bertram Hartfree, the engineer and surveyor to the Alton, Hants, Urban District Council. The general object of these articles, which have dealt with a wide variety of topics, has been to indicate to municipal engineers who may be called upon in an emergency to render assistance to the military authorities the general principles underlying those classes of work which are most likely to fall to their lot. In the article in our present issue the writer deals in succession with the case where a kitchen is wanted for immediate use, the provision of kitchens in connection with billets in empty buildings, and the construction of trench kitchens of various types. Finally, he deals with the most important considerations to be borne in mind in the selection of a site for a camping ground. This is, perhaps, one of the most likely points for consultation with a civil surveyor acquainted with the neighbourhood in which it is desired to settle. As Mr. Hartfree points out, the primary factor is a suitable soil, which in no case should be impregnated with subsoil water. Other important considerations are the avoidance, as far as possible, of sites recently occupied by other troops; the selection of a suitable aspect; and the provision of an area adequate to accommodate the number of troops to be provided for. In the last respect, [illegible] the side of generosity.

* * *

Sanitary Institute Lectures.

The Royal Sanitary Institute have arranged, as usual, during the forthcoming Spring a [illegible] highest educational value for sanitary officers. It is pointed out in the syllabus that the lectures are in no way meant as a substitute for the practical familiarity with sanitary work which the efficient inspector must necessarily possess. As a supplement to this part of his training, however, their usefulness cannot be gainsaid. The full syllabus comprises almost, if not quite, every branch of knowledge which the fully equipped sanitary inspector ought to possess, and the names of the [illegible] lodged expert in his own subject is alone a sufficient guarantee of the quality of the instruction to be given. The subjects in Part I. of the course include elementary physics and chemistry, public health statutes, the practical duties of a sanitary inspector, municipal hygiene, and building construction in its sanitary relations; while Part II. consists of seven lectures on meat and [illegible] of water, food, and drugs for analysis. The whole course is supplemented by a series of inspections, demonstrations, and visits to various public and private works, illustrative of sanitary practice and administration. It only remains to add that the privilege of attendance is not confined to members of the institute or to prospective sanitary inspectors, and that many of the topics to be dealt with are of direct interest to the young municipal engineer.

* * *

Flies and Health

Apropos of our remarks last week calling attention to the [illegible] report to the Local Government Board on "Flies as Carriers of Infection," it is of interest to recall that in a circular letter relating to the prevention of [illegible] the Board so early as 1908 called attention to the [illegible] In that letter it was stated that for practical purposes the number of flies in the summer months [illegible] under present conditions, of the possibilities of [illegible] by decomposing organic matter, especially in districts in which privies and pail closets persist, and in which accumulations of house refuse or [illegible] are permitted. The rapid development of flies and the necessity for the frequent cleansing of their breeding places, and it is only by vigorously attacking the pest at this source that any appreciable reduction in its numbers can be effected. The part of the ordinary householder in this warfare for health must, however, consist in the destruction of the adult insect. To this end the use of fly traps or papers should be encouraged in every possible way, and any handbills in regard to domestic cleanliness or hygiene issued either by health societies or sanitary authorities ought certainly to include directions for the destruction of flies.

C*

Madras City Water Supply.

OPENING OF NEW WORKS.

New water supply works for Madras, for the entire design and construction of which Mr. J. W. Madeley, M.A., M.INST.C.E., M.AM.SOC.C.E., special engineer to the corporation, has been responsible, were formally opened by the Governor, Lord Pentland, on December 17th last.

Originally the city of Madras obtained its water supply from shallow wells. These became polluted and dangerous to health through contamination of the subsoil water by the constant stream of sewage which was allowed to soak into the ground. Complaints were numerous, and various schemes were put forward. Eventually a proposal to obtain water from the present sources was adopted, and the works were inaugurated in 1872. This supply having proved unsatisfactory, the new works have been carried out to remedy the defects.

The Madras City water supply is part of a project undertaken with the object of utilising, to the fullest economical extent, the waters of the Corteliar River and its tributaries. This is effected by means of a masonry weir built across the Corteliar River at Tamarapakkam. This weir diverts the river—excluding the greater flood discharges—into a channel feeding the Cholavaram and Red Hills tanks which store the flood water, resulting from the monsoon rains, and render it available during the months that the river bed is dry. From the lower of these—the Red Hills tank—the Madras water supply is drawn. The water from both tanks is also used to irrigate a first crop area of 7,500 acres, and a second crop area of 3,200 acres. The water thus used for irrigation is estimated to amount to about three times the present water supply to Madras. The Red Hills tank is fed partly by rain falling on its own catchment area, but mainly from the Cholavaram tank, which, in its turn, is supplied by the Corteliar river itself, by means of the channel starting at Tamarapakkam anicut, and also by the rivers Katankal and Bosikal (tributaries of the Corteliar), which are intercepted by the same channel that carries the water of the Corteliar to Cholavaram tank.

The storage capacity of the two tanks is 2,741 million cub. ft.; the average rainfall over the whole catchment area may be taken as 57 in. per annum.

The following new works have been constructed to remedy the faults in the old works:—

(1) An intake tower in Red Hills Lake located at a point where the water is deep so that the lake can be almost entirely emptied without pumping.

(2) An underground conduit to replace the existing open channel. This conduit will prevent loss by evaporation and percolation, will convey an adequate supply of water, and will remove the possibility of pollution in transit.

(3) Sand filters to purify the water.

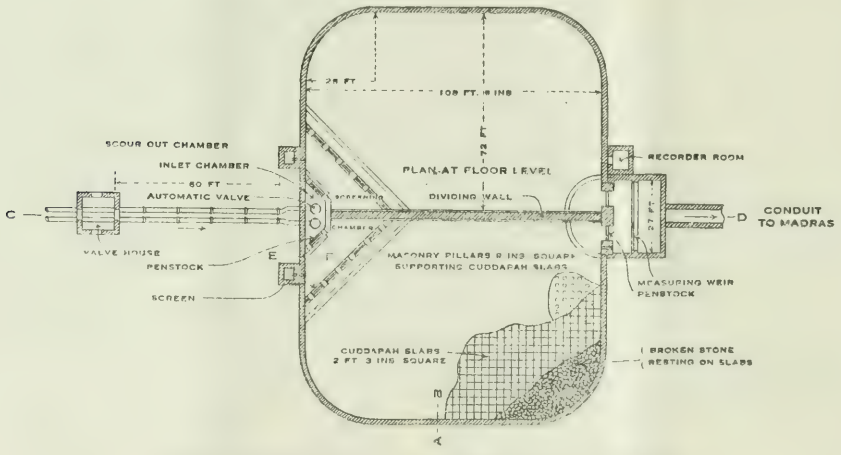
(4) Pure-water tanks to store the filtered water.

(5) Pumps to impart to the water an adequate pressure.

(6) An elevated tank to ensure the maintenance of a steady pressure in the mains.

(7) The remodelling alteration and extension of the distribution system so as to provide all the inhabitants of Madras with an adequate quantity of water under sufficient pressure.

The whole of these works—(1) to (6)—were completed by December last except for the supply of filtering materials for five filters. The most important mains of the new distribution system, together with a large number of urgently required street pipes, have been laid. The main object of the new works—the furnishing of a sufficient supply under adequate pressure—is now accomplished. The principal works remaining to be done are the completion of the subsidiary mains and distributary pipes, and the installation of waste-water detection meters. These works are delayed



Madras Water Supply: Plan of Roughing Filters (Fig. 1).

owing to the decision of the corporation to defer entering into contracts for large quantities of materials during the uncertainty which now prevails in consequence of the war.

Before construction was commenced the question of the agency by which the waterworks should be carried out was carefully considered, and it was eventually decided that the work should be divided into small sections, so that it might be executed by local contractors. This was thought preferable to importing outside contractors with up-to-date plant, machinery and methods of construction such as are used in Europe. It ensured that the money spent on the work should, as far as possible, be paid to local firms, and, further, it was considered that the work would be done more cheaply, although the time taken would probably be longer. The results have confirmed these anticipations, and the employment of local contractors has been justified in so far as the cost has been kept low; but, on the other hand, the rate of progress has been much less than it would have been if some large European firms had been entrusted with the whole of the works. Contractors with up-to-date plant and skilled foremen are very much wanted in Madras in order to speed up the rate of carrying out work.

COST.

The total estimated cost of the works is about Rs.63 lakhs [£419,958], of which works to the value

[illegible] 12 miles (19,979 yd.) have been completed. The remaining 21 miles 5 f. [illegible] are almost wholly required for the purchase and laying of cast-iron pipes, &c., which will be obtained [illegible].

It is satisfactory to be able to state that the [illegible] work have cost less than the estimated amount, and there is reason to anticipate that the whole of the works will be completed within the estimated amount, unless there is a further rise in rates in addition to the increase that has already taken place.

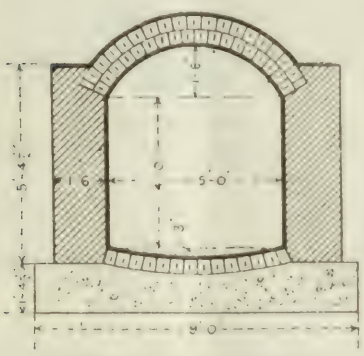
RECENT IMPROVEMENTS OF NEW WORKS.

The two 24-in. pipes from the reservoir [illegible] are passing through the [illegible] chamber, the walls of which are fitted with movable copper [illegible].

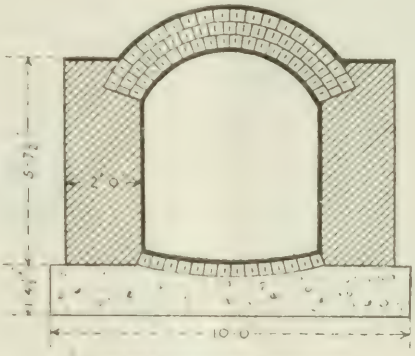
Fig. 3 illustrates a similar section of the conduit for deep excavation.

The whole of the internal surface of the conduit [illegible] with a coat of cement to [illegible] in thick, and the outside of the earth is protected with [illegible] concrete.

When originally designed it was not intended that the conduit should be subjected to internal pressure. Where [illegible] it was proposed that [illegible] pipes should be used. After careful consideration, however, it was decided to [illegible] and although the [illegible] conduit [illegible] the [illegible] pipes [illegible] the [illegible] it was decided that [illegible] should be perforated with barbed wire to take the tension.



CROSS SECTION OF CONDUIT IN SHALLOW EXCAVATION 11 FEET OR LESS TO INVERT



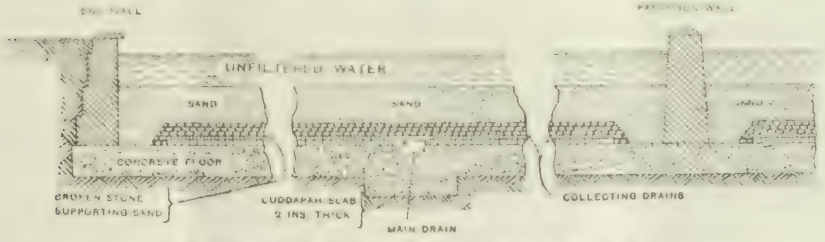
CROSS SECTION OF CONDUIT IN GOOD GROUND 11 TO 18 FEET TO INVERT

MADRAS WATER SUPPLY. [illegible] (Fig. 2, page [illegible] Note.—Interest [illegible] on the same [illegible].)

[illegible] must pass in order to reach the roughing filter.

The roughing filters [illegible] long, 108 ft. wide, and 8 ft. deep. It is divided into two compartments, each of [illegible] half may be thrown out of use for repairs or cleaning while the other half remains in use. Ordinary cleans-

Fourteen filters of the ordinary slow sand type have been constructed. The filters are arranged in two rows of seven each, it being intended that six filters of each row, twelve in all, should be continuously in operation, allowance being made for one filter in each [illegible] being under repair or being cleaned. [illegible] each



MADRAS WATER SUPPLY. SECTION OF FILTER. (Fig. 4.)

ing will be effected by reversing the flow through the filter.

The filtering medium consists of 3 ft. of [illegible] trap rock, varying in size from that which will just pass through a 1½-in. ring at the bottom to the top layer, which will pass through a ⅜-in. ring and be rejected by a ¼-in. ring.

The conduit which conveys the water from the roughing filter at Red Hills to the sand filters at Kilpauk is 7 miles in length, and has an average gradient of 1 in 4,470. Internally, the conduit is 5 ft. wide, with vertical side walls 4 ft. high to the springing of the arched roof, which has a rise of 18 in. The floor is inverted, with a dip in the centre of 3 in., so that the maximum height is 5 ft. 9 in.

A typical cross-section in shallow excavation, which applies to most of the conduit, is shown on Fig. 2, from which it will be seen that the concrete floor averages 15 in. thick, and is covered by a 4½-in. brick invert. The side walls are in brickwork 18 in. thick, and the arch consists of two rings of brickwork.

will be constructed when required. The conduit which brings the water from the Red Hills is continued round the fourteen filters, and is connected to each bed by a 14-in. diameter cast-iron pipe controlled by a valve, so that any filter may be isolated for cleaning or repair. Between the two rows of filters runs the filtered-water channel, to which filtered water from each bed can be delivered through a Glenfield-Jones automatic [illegible]. Each filter is 200 ft. long and 100 ft. wide. A typical section of a filter is shown (Fig. 4).

Below the top of sand level the walls are slightly battered, in order that the sand by its own weight may be packed tightly against the walls, and thus prevent the free flow of water between the sand and the walls. As a further precaution, neither the drains nor the broken stone at the bottom of the filters are taken right up to the side walls. The drains are stopped 3 ft. away from the walls; broken stone is placed round the ends of the drains, and the space between the stone and the walls is filled with sand.

The filtering material consists of clean, washed,

river sand, screened so as to eliminate all material except that which passes through 1/30-in. mesh and is retained on 1/50-in. mesh. Under the fine-sand layer, 28 in. deep, is a layer of coarse sand, 2 in. deep, resting on broken granite stone laid in two layers, each 2 in. deep. The top layer of stone will pass a ½-in. ring, and be retained on a ⅜-in. ring; the bottom layer will pass a ¾ in. ring and be retained on a ⅜-in. ring.

Below the bottom layer of stone are brick collecting drains, consisting of rows of best pressed bricks laid flat, 4½ in. apart, and covered by another layer of bricks with open joints. Through these drains the water makes its way to the main semi-circular drain running along the centre of the bed and sunk below the floor. This drain is 24 in. wide, and is covered by Cuddapan slabs. It leads to a rectangular filter outlet chamber.

The three underground covered pure-water storage tanks are each 150 ft. square, with a depth of 10 ft. of water, and have a capacity of 1,400,000 gallons each. The tank floor consists of 2 ft. of concrete, and the side walls are of brickwork. The roof is supported on brick jack arches, springing from steel girders resting on brick cross-walls carried by arches springing from granite stone piers. Each tank is provided with a 30-in. inlet and a 30-in. outlet, both fitted with sluice valves. A scour is also provided for emptying and cleaning each tank.

From the pure-water tanks the water gravitates to the suction culvert, whence it will be pumped into the corporation mains through a 48-in. diameter steel main ½ mile long. An elevated tank is connected with the pumping main, in order to act as a balancing tank between the pumps and the distribution system.

The pumping plant has been supplied and erected by Messrs. James Simpson & Co., of England and Calcutta. It comprises three high-duty Worthington direct-acting pumping engines, each capable of delivering 12,000 gallons of water per minute against a maximum total head of 80 ft. Three Babcock & Wilcox boilers, each capable of supplying steam continuously to any two engines working together against a total head of 80 ft., are provided.

THE DISTRIBUTION SYSTEM.

When the new distribution system was designed it was anticipated that such loans as would be required to defray the cost of the work would be subject to repayment over periods of from thirty to fifty years, according to the nature of the works, and thus it was considered that the distribution system should be sufficient for the needs of the consumers at the expiration of that period. The pipe system was therefore designed so as to suffice for all parts of the city up to 1961, when the population is expected to be 660,000.

The new supply provides for a consumption of 25 gallons per head per day, and the distribution system has been planned so as to be capable of supplying water at a rate equal to three times the average daily demand—that is, at the rate of 75 gallons per head per day. At the average rate of supply of 25 gallons per head per day the pressure will be about 50-ft. above ground level at the ends of principal mains, and additions and alterations to the existing system have been worked out to ensure this pressure.

The pipes of the distribution system vary in diameter from 3 in. to 42 in. The total length of new pipes is about 140 miles, and of old pipes retained 110 miles—a grand total of 250 miles in the completed system. The smallest new pipe is 4 in. in diameter.

HOUSE SERVICES.

Each service starts with a brass ferrule in the water main, and is provided with a brass screw-down stop-cock in the road. Lead or iron pipes may be used, but if the latter they must be properly protected from corrosion when laid in earth.

Two classes of connections have been adopted—namely, first-class and second-class. The second-class, which will apply to the bulk of the population, enables a householder to have his own taps provided they are placed in such positions that they can at all times be inspected by the municipal staff. No second-class service will be of larger bore than ¾ in. Anyone desirous of having a supply which is not open to inspection without notice may have a first-class service, which is subject to the following conditions:—

(1) The householder is required to hire water meters placed at his disposal by the corporation, to adopt specified fittings, and to secure approval of the position of pipes and taps.

(2) He obtains a full supply of 100 gallons per day for every rupee of rent, with a minimum free allowance of 3,000 gallons per month.

(3) A charge of 12 annas per 1,000 gallons is made for all water used in excess of the free supply.

It is believed that by the adoption of this method of house service, everyone in the city will have all the water which he legitimately requires, and that it will at the same time tend to reduce waste to a minimum.

PREVENTION OF WASTE AND LEAKAGE.

A waste-water meter system will be introduced into the city as soon as the requisite pipes and valves have been laid. For this purpose the city has been subdivided into 134 districts, and the mains so arranged that by closing a few valves the whole of the water required by any district is passed through a pipe on which is placed a waste-water meter.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

A meeting of the council of the Institution of Municipal and County Engineers was held at 92 Victoria-street, Westminster, on Saturday, January 9th. Present: Messrs. J. S. Pickering (president, in the chair), W. N. Blair, J. Patten Barber, J. A. Brodie, G. F. Carter, F. C. Cook, W. Harpur, T. W. A. Hayward, W. T. Lancashire, W. H. Prescott, P. H. Palmer, N. Scorgie, H. T. Wakelam, C. F. Wike, O. E. Winter, the consultant secretary, and the secretary.

THE MEMBERSHIP ROLL.

The following candidates were elected:—

Members: Messrs. E. T. Annett, assistant borough surveyor, Gillingham, Kent; J. B. Cooke, engineering surveyor to the Denton Urban District Council; W. J. Hiscox, surveyor to the Hay Urban District Council; T. H. Negus, engineer to the Meriden Rural District Council; and H. A. Newman, chief assistant to the Finchley Urban District Council.

Associate-member: Mr. F. S. Oldfield, engineering assistant to borough engineer, Battersea.

Students: Messrs. C. H. Collins, articled pupil to surveyor at Walsall Rural District Council; and W. S. Wilson, engineering assistant to borough surveyor, Chesterfield.

Transfer from Associate-member to Member: Mr. W. H. Pearce, engineer and surveyor to the Swanage Urban District Council.

LETTERS OF CONDOLENCE.

It was resolved to send letters of condolence to the relatives of the late Mr. Frank Sumner, engineer to the City of London, and of the late Mr. T. Callen.

AWARD OF TESTAMUR.

It was resolved to award the testamur of the institution to Mr. J. P. Pike, assistant to the municipal engineer of Port Elizabeth, as the result of examination held in South Africa.

CHARLES JONES MEMORIAL.

A report was received from the Finance Committee as to the method of utilisation of the fund raised to perpetuate the memory of Mr. Charles Jones. In view of the wishes of the family of Mr. Jones, and the difficulties which would be experienced in establishing a prize, it was resolved to utilise the fund for the purchase of a replica of a portrait of Mr. Charles Jones presented to the Ealing Town Council, to be hung in the council chamber of the institution.

NOMINATION OF VICE-PRESIDENTS AND HON. TREASURER.

It was resolved to nominate Messrs. J. S. Brodie, T. W. A. Hayward, and P. H. Palmer as vice-presidents, and Sir James Lemon as hon. treasurer for the year 1915-1916.

ANNUAL MEETING, 1915.

The arrangements for the annual meeting to be held in 1915 were left in the hands of the president-elect, Mr. H. T. Wakelam.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

Camp Kitchens.

By G. BERTRAM HARTREE, A.S.I., Engineer and Surveyor to the Alton, Hants Urban District Council.

In providing food for soldiers [illegible] placed across [illegible] a galvanised stake driven in the ground. In the open form the cooking pot is supported on a tripod and underneath three burning brands lie radiating with their flames under the pot, the wood being pushed forward as the centre of the fire is reached. Other simple type methods [illegible] placed transversely across to carry the pot. On marshy and similar ground, where excavations have a disadvantage, two parallel rows of sods are built up with a space between for the fire. The Red Cross Training Manual advises that, in cases where a kitchen is wanted immediately, parallel rows of cooking pots should be [illegible] at such distance between rows that other pots can be supported by them.

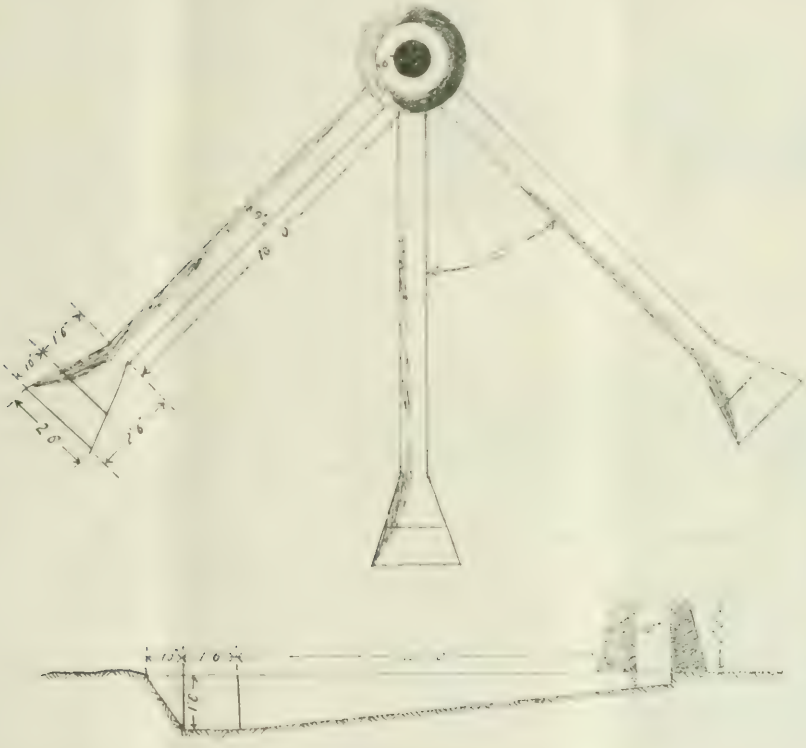


FIG. 1.

In arranging for billets in empty buildings, a common practice is to utilise three piers of bricks to support the pot, and a roof supported by four posts to protect from rain. By supplying spare sheets of corrugated iron, the camp cooks are able to make a draught to suit their purpose. A further improvement with movable sides and fixed span roof is known as the "Pent" cook-house.

In constructing a trench kitchen, the following dimensions are usually followed: Mouth, 2 ft. 6 in. wide, commencing at ground surface and tapering to a depth of 1 ft. 6 in. at a distance up of 1 ft. On plan the mouth tapers to 9-in. width at a distance back of 2 ft. 6 in., and a trench 10 ft. long continues from mouth to flue. The depth of trench is 1 ft. 6 in. at mouth, and 4 in. at flue end. The flue should be about 2 ft. in height, formed of rough sods, with an internal diameter of 12 in., and a thickness about 6in. The position of trench must allow the wind [illegible] flue. The top [illegible] broad-arrow kitchen as illustrated.

When constructing a row of trenches with separate flues the distance apart generally adopted is from 6ft. to 8 ft.

To reduce the number of flues, ofttimes a number of parallel trenches are connected to lateral trenches, and these join a main flue. This type of construction requires a transverse mouth trench 2 ft. wide and 1 ft. 9 in. in depth. To ensure good results, a branch trench should *not* join a main opposite another, and so avoid conflicting draughts. This type is known as the "gridiron" trench, and the illustration shows a four-trench gridiron. As many as twelve trenches have been found successful on this plan, subject in every case to following the rule as to direction of wind.

SELECTING A CAMPING GROUND.

The first important factor for consideration when selecting a site for a camp is suitable soil, and its suitability will be governed by its natural dryness. An earth impregnated with subsoil water is very objectionable, as at night, the temperature inside the tent being greater than outside, evaporation must take place.

In most instances, and especially under war conditions, it is advisable, for several reasons, to avoid the sites recently occupied by other troops.

In the British Isles a south-east aspect is the best, and due south is next in order. The south-west generally is to be avoided, owing to the possibility of driving rains. Low lands liable to floods must be avoided, and there is an equal objection to bottoms

of declivities that receive subsoil water from heights above. Rock or gravel are good soils, loam is fair, and clay may be equal to the latter if sun-baked; otherwise it is inferior. Heather, pasture land, and stubble fields are more suitable than long grass or ploughed land.

In considering areas, the following may be taken as suitable for units: One battalion of infantry,

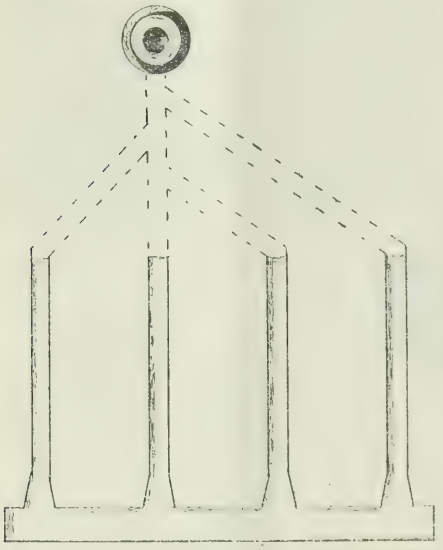

Fig. 2.

150 yds. by 120 yds.; one regiment of cavalry, 160 yds. by 180 yds.; one battery of artillery, 80 yds. by 130 yds. With larger bodies addition must be allowed for headquarters and attached services. Pending definite instructions from the military, should a civilian surveyor be acting in the matter, he should endeavour to obtain ground for double the above space, and add 30 per cent for transport, medical service, and so forth.

WHATMAN FILTER PAPERS.

At a time like the present, when consumers in the United Kingdom of all kinds of articles are seeking to replace goods previously made in Germany by those of British manufacture, it will be of interest to many of our readers to learn that Messrs. W. & R. Balston, Limited, of Whatman drawing-paper fame, have turned their attention to the production of filter paper used in analytical and technical chemistry, and have already placed on the market a grade which they claim to be fully equal to a well-known German make, and which they are offering at the price demanded for the foreign article. Messrs. H. Reeve, Angel & Co., 15 New Bridge-street, London, E.C., who have been appointed Messrs. Balston's representatives for promoting the sale of these filter papers—a number of samples of which have been submitted to us—inform us that the firm are now proceeding to manufacture the washed qualities, and that ultimately they will produce all the higher grades for which there is any demand.

Coast Sand Dunes, Sand Spits, and Sand Wastes. (By G. O. Case. Price 5s. St. Bride's Press, Limited, 24 Bride-lane, E.C.). . . . "A most useful little book crammed with facts culled from all parts of the world and well illustrated with photographic reproductions and diagrams. Numerous references to other works are given. Mr. Case discusses the formation and distribution of sand dunes and the devastation caused by them when they move inland, and then goes on to consider protective works and the reclamation of sand wastes. If we have one criticism to offer it is that the book is too condensed. There is certainly not a superfluous paragraph."—*Geographical Journal.*

HASLEMERE SURVEYOR AND HIS DUTIES.

"SUFFERING FROM BEING COMPETENT."

An unusual situation which has arisen at Haslemere with regard to the relations between the urban district council and their surveyor, Mr. H. V. Snook, was (the *Surrey Times* reports) discussed at a special meeting of the council recently. The request from Mr. Snook that the council should define his duties and hours of work arose, it appeared, because he considered that some members of the council were unappreciative of the fact that during the past year he had done a great deal of work which could not be regarded as being within the scope of his ordinary duties.

At the request of the chairman (Mr. E. Eley), Mr. A. G. Whitcher, the clerk, read the surveyor's list of duties as contained in the agreement of the surveyor's appointment, and Mr. C. J. Welland said, considering that Mr. Snook had accepted the position with certain specified duties, he did not see how they could vary the arrangement. The agreement provided that he should perform all the duties of the office, and that he should be a whole time official.

The chairman explained how the question had arisen. Mr. Snook had asked the council to define his duties and his hours of labour. Mr. Snook had done a great deal more than they might reasonably have expected from him, but what he had done had not been appreciated.

Mr. Waterston: In what way has it not been appreciated?

Mr. Snook explained that the point arose following a remark by Mr. Mills to the effect that he (the surveyor) should undertake work in connection with the drainage scheme, because he had carried out the design and construction of the new depot, and Mr. Mills said that, therefore, no payment should be made for work done in connection with the drainage scheme until such time as the plans had been finally approved. He felt very strongly on the point, because he had done practically the whole of the depot work in his own time between 6.30 p.m. and 11 p.m. He did that because they wanted the depot, and wanted to get it done as cheaply as possible, and he made no bones about doing it, even though it did mean all that work in his own time. But he did not want that to be regarded as a precedent. It must be understood that if the work was going to be of such a nature that he could not perform it in a reasonable time his hours must be defined. When getting out the plans for the depot, his hours were eight in the morning to eleven at night, and if that were going to be expected of him he should be following a rather dangerous policy.

Mr. Mills said he had not objected to extra payment being made with regard to the work to be done in connection with the new drainage, but his point was that extra payment should not begin until after the inquiry had been held.

Mr. Waterston: I should like Mr. Snook to reconsider his position.

The Surveyor: At the last meeting I produced a list of the works which had been done during the last twelve months. It is impossible to keep on at the same rate with the routine work of the district going on at the same time. I suppose we are rather an ambitious little district, and we have done a great deal of work. The report I made with regard to the drainage took me five days of levelling to see how best we could drain the district, and it necessitated nearly 1,000 inspections. That is all in addition to the ordinary routine work.

In the course of further remarks, Mr. Snook said he thought that the extension of headings at the waterworks did not come within the terms of his appointment.

Mr. Mills pointed out that one of the conditions of the appointment was that the surveyor should carry out the instructions of the council. If there were too much to do the surveyor ought to have temporary assistance during the time of pressure.

The Chairman: That is not the point, Mr. Mills. You have got hours for opening and closing up shops, and what Mr. Snook asks is that the hours should be defined during which he is at the council's service. No one can expect him to be at the beck and call of the council for the twenty-four hours of the clock.

Mr. Mills: I do not object to the hours being fixed, but what I do object to is the absolute refusal to carry out the waterworks headings.

The chairman said that was the work of a civil engineer. If they had a surveyor who had the brains

and the question to be considered is whether or not the men are to be permitted, but they were not entitled to expect him to give both those matters consideration and then not be questioned.

Mr. Mills: I have never been questioning the question when the contracts have been.

The Surveyor: I really cannot see that I can be more explicit. He asked that the hours of the men employed for the council should be reduced from 54 hours in his position.

Replying to a further statement by Mr. Mills, the surveyor said he did not intend to be discourteous with the questioning of the members, but he did not like to be cross-examined in the manner.

Mr. Mills said he did not mean to be unreasonable at all. He thought the surveyor could have come to the point long ago and saved the time. One thing he did not like was the manner of the surveyor at the last meeting when the council really only wanted all the particulars for 14 days.

Replying on other questions, the surveyor said the office staff now have from nine to five and one to two on Saturdays. In answer to another question he said he would be more than glad not to have to be called out at midnight or at three or four in the morning to the fitters on the pier, should any emergency arise, but when he signed that he should be able to do the ordinary work of the council in a reasonable number of hours in the day.

On the motion of Mr. [illegible] it was agreed that Mr. Snook's hours should be from nine to five and none to see the Saturdays.

Mr. Snook thanked the council, and said he was quite prepared to compromise the work of collecting the water leading question that if it necessitated his taking up a lot of time the council would not feel that he was breaking his contract with them in asking for [illegible] assistance if he found the work too great.

SOME RECENT PUBLICATIONS.*

Liverpool Town Planning and Housing Exhibition, 1914. Liverpool: Corporation. Edited by S. D. Adshead & Patrick Abercrombie. 9 in. 7 in. 64 pp. Liverpool: The Daily Post Press.

The Town Planning and Housing Exhibition which is now being held at Liverpool [illegible] March will be well worth the consideration of any member who is desirous of keeping in touch with the most practical side of the movement that has taken place in recent years, which has led to the [illegible] hands of the larger constituency which could not be present. [illegible] the exhibition have been selected by the chairman of the committee responsible for the [illegible] was divided. It would be difficult elsewhere to find within so small a compass the opinions of so many acknowledged experts on the wide variety of topics which come within the province of the modern improver of a modern town.

Cement Croutins.—Mr. A. Rollins, M.Inst.C.E., engineer and surveyor to the Liversedge Urban District Council, desires information relating to contractors or others who possess a process of cement-grouting foundations who would be willing to quote for some work in Liversedge.

Association of Somerset Surveyors.—The autumn general meeting of the Association of Somerset Surveyors will be held at the Merchant Venturers' College, Bristol, to-morrow (Saturday), when the following business will be transacted: (1) The election of president and officers for the ensuing year; (2) to ballot for the election of members on the Executive Committee; (3) president's address; (4) presentation of premiums to any other business. The president-elect—Mr. F. W. Jones, [illegible] invites all members to tea at the conclusion of the business. Subsequently a short convivial gathering will take place, and all members are requested to assist in this direction.

* Any of the publications noticed can be procured through, and forwarded by the "S. E. & I. Press, Limited," on receipt of published price, plus postage in the case of [illegible] books.

REFUSE DESTRUCTION IN AUSTRALIA.

MELDRUM INSTALLATION FOR NORTH SYDNEY.

[illegible] Meldrum [illegible] of the [illegible] Meldrum Destructor Company, Limited, Manchester, [illegible] Australia, [illegible] the [illegible] North Sydney [illegible] Council, [illegible] are now [illegible] and [illegible] working.

North Sydney Destructor.

The plant is the Meldrum [illegible] type, and is fed [illegible] hopper feeders, each [illegible] charge of refuse [illegible] The actual [illegible] has been 1s. 7d. per ton.

Interior of North Sydney Destructor.

It is proposed to utilise the [illegible] in connection with an adjoining tar plant and for other municipal purposes.

[illegible]

Tramways and Light Railways.—The annual report of the Board of Trade respecting tramways and light railways under Order in Council for the year 1913 shows that [illegible] and light railways in the kingdom [illegible] and [illegible] March last 2,707 miles [illegible] having increased from slightly under £4,250,000 to nearly £81,000,000.

Concrete Roads *v.* Concrete Foundations.

By W. W. CROSBY, Baltimore, Maryland.

For the sake of making clear the statements to follow, let it be assumed primarily that a "concrete road" is one in which the artificial surfacing for the roadway is built of a concrete composed of hydraulic cement, sand, and gravel or broken stone, all of predetermined proportions, and is *not* covered or protected from wear by a carpet or coating of appreciable thickness of pitch and other material. Then all those roadways of which a cement concrete layer is covered by a carpet of pitchy material will naturally fall together into another class where a "concrete base" or "foundation" supports a wearing surface composed of block paving, sheet or rock asphalt, bituminous carpets, &c., and in the consideration of these instances of the use of concrete the latter will be referred to as the "concrete foundation." Further, it should probably be understood that in writing the following the author had in mind when he referred to a road or street those public highways on which a considerable amount of animal-drawn and of hard-tyred traffic might be expected, along with motor traffic carried on rubber tyres. In any case, where the road-crust is not open to use by an appreciable amount of the former traffic, some of the remarks made might have to be considerably modified.

The use of concrete for both road surfaces and road foundations is not new. Thirty or more years ago the concrete road (in the above-described sense of the term) was "discovered," tried out and abandoned. It was found to possess certain inherent defects, and under the then existing conditions these proved so serious that its economical use was found to be limited so as to result in the practical abandonment of this form of surfacing for the time being. With the changed conditions now existing the use of concrete for roadways has again begun. The increase of traffic has demanded stronger roads. The reduced ratio of horse-drawn to total traffic has changed the average character of the stresses on the surfacing material. The immense reduction in the cost of "hydraulic cement," and the improvements in machinery for mixing and placing the concrete have aided the latter to compete with other road-crusts in first cost, and also in long-run costs. And it seems to the writer that, under the changed conditions, there are at present many cases where existing circumstances, such, for instance, as poor natural foundation for and heavy traffic on the roadway, or convenience in the supply of materials for concrete, justify, or even demand, its selection for at least a part of the road-crust. On the other hand, the tendency of certain road authorities and others to rush to "concrete" as a panacea for all road ills is to be deplored as both irrational and extravagant. In these days the great problem for road authorities is the proper selection of the form of construction best suited for the circumstances of any particular case, and a sufficient variety of surfacings, including concrete, is now available to permit true economy to be had by a proper choice.

Of the factors influencing the decision for or against the selection of concrete as the road surfacing may be considered: "Cost (first and long-run), durability, ease of maintenance, cleanliness, resistance to traction, slipperiness, sanitariness, acceptability, favourableness to travel."*

COST.

Only too frequently this consideration is limited to first cost, and fails to include, as it should, the interest charges on first cost and the cost of maintaining the pavement in as good condition as when first completed (or a "depreciation charge"), in order that a fair comparison may be drawn. Concrete can never be as low in first cost as macadam under the same conditions, because of the introduction into the former of cement, for which an additional cost has to be met. Ordinarily, though competition may be had—often successfully—by a proper assumption that a less thickness of concrete will be as strong as the macadam to be prescribed, and, further, that it is frequently possible to use in the concrete a local material for the aggregate which may be secured at a smaller cost than necessary for a proper stone for the macadam. A local granite may make an excellent concrete when it would prove entirely unsatisfactory, because of its lack of binding qualities, for macadam, and if macadam were to be built the cost of importing a suitable stone might offset the additional cost of making concrete from the local granite.

In the same way, where small, sandy gravel is plentiful in a locality, and good stone for broken stone macadam is required to be imported at a considerable expense, frequently gravel-concrete roads, or gravel-concrete foundations carrying a bituminous surface, will be found to be the economical solution.

Contrary to the arguments of many of the advocates of concrete roads, a concrete surfacing is not "permanent" in the sense that it will last indefinitely without repair. It is unfortunate that in the advocacy of modern road improvement the use of this word "permanent" has been so indiscriminate. No road surface is permanent. All require repairs from time to time if they are to be kept continuously in good condition, and the use of the word "permanent" in the arguments for better roads has been deceptive. Its abuse has produced disappointment, frequently a reaction against the movement, and often extravagance in later expenditures. It is questionable whether or not the cement manufacturers themselves, to whom many of the arguments for concrete roads may be traced, are working for their best interests in the end by their reference to concrete as "a permanent road" surfacing.

Concrete roads, in addition to the interest charges to be figured in their long-run cost, require continuous expense for maintenance and repair. Except, possibly, in those cases where a kerb adjoins the edges of the concrete roadway, the shoulders (even if the concrete itself does not) begin the day after the completion of the roadway to need maintenance. The usual sudden transition from the rigid concrete to the softer shoulder material produces, under the first heavy vehicle that in passing turns out and off the concrete, a depression or rut along the edge of the concrete. This depression or rut is a vulnerable spot in the armoured roadway, and must be immediately protected by repair against serious consequences from the entrance of water, or from material damage to the edge of the concrete itself. These points of weakness, which also are likely to occur between the earth shoulders and any road surfacing, are, in the case of concrete roads, more frequent and of greater extent, because of the greater difference in rigidity between an earth shoulder and the concrete than between the same kind of shoulder and a gravel road, for instance. While the shoulder maintenance may not be a part of the maintenance charges for the concrete itself, it certainly is a part of the road maintenance, especially where, in order to keep the first cost down, the concrete surface has been built too narrow in width to carry on it all the traffic, and a considerable portion of the latter constantly turns out on the shoulders. Certain road authorities have seemed frequently to neglect, in deciding widths or character of surface to be built, a proper consideration of the comparison between shoulder maintenance costs and interest charges, plus surfacing maintenance costs, with the results of dissatisfaction to the road user and excessive costs in the end to the contributors.

The concrete surfacing itself will, after a period dependent, of course, on local conditions, require repairs, and it is an inherent difficulty of concrete that repairs to it are not easily made. This fact was one of the main reasons for the abandonment of the earlier efforts to use concrete for road surfaces. While these repairs may seem in some respects relatively slight, the expense for them will be inversely large.

Reliable figures of cost for maintenance of concrete roads are not as yet at hand, but the foregoing may serve to indicate, from the point of view of cost, the factors to be considered in this connection, and the points of weakness in some of the arguments that have been advanced for the more general adoption of concrete road surfaces.

* See "The Scientific Selection of Pavements," *Municipal Journal and Engineer*, New York, May 29, 1913, p. 737.

[illegible] ability to wear uniformly, and this is frequently, if [illegible] even if slower, rate of wear. The difficulties in the [illegible] deliver a uniform product, that there is frequently [illegible] that there often is variation even between the pro[illegible] less irregular, and segregation and other causes for non-uniformity generally arise during the mixing and placing of the concrete. All these contribute to [illegible] surfaces of spots of unequal abilities to resist wear [illegible] of proper repair [illegible] tions to this type of pavement.

[illegible] vision does reduce to some extent the lack of homogeneity in results, certain inherent irregularities can only be reduced by mechanical means, while certain others seem inevitable. For instance, the natural irregularity in position of the stone in the [illegible] considerable extent by rolling, so that, just as in good broken-stone macadam, the majority of the [illegible] macadam. Harrowing a layer of broken stone will [illegible] of stone in the surface. Hence there seems to be [illegible] of a concrete road surface formed by grouting the broken stone, spread and rolled in place. Further, the mechanical bond thus secured between the stone particles is worth considering as an additional factor for strength and durability.

[illegible] tory. In the first place the difficulty of remedying a slight depression worn into the surface under traffic generally leads to letting such a defect increase to material dimensions before attempting its repair. [illegible] depression with any degree of surface smoothness [illegible] made, sufficient to provide space for placing in it aggregate of the same size as that which forms the adjoining surfaces and flush with them. Also, it is necessary that the new concrete be of uniform thickness, not tapering off at the edges. This means that for the proper repair of a hole the old concrete must be more or less cut away—a rather expensive proceeding. Even then a good bond—a thing by no means frequently secured between the [illegible] and the old concrete, the joints in the surface soon become objectionable. When the ordinary concrete road surface begins to need repair, it is practically only a question of a short time when the concrete surfacing will have to be abandoned as such and turned into a concrete foundation, because of the difficulties of repairing the concrete so as to leave it satisfactory as a road surface.

If a concrete road is built of gravel, notwithstanding that the average greater strength of gravel concrete is greater than with broken stone concrete, the lack of mechanical bond obtainable from the rounded stones in the surface renders the latter particularly susceptible to damage by the shod feet of draught animals. The blow of a horseshoe may break the cementing mortar around a stone, and the pushing or twisting of the foot may then easily dislodge the stone from its place. Of course, the adjoining stones are then more easily dislodged, and the hole in the surface grows rapidly and needs repair.

The difficulties of proper repair are so well recognised that many engineers are now recommending such work to be done with bituminous concrete instead of cement concrete; but, of course, this is only a step toward the ultimate transformation of the "concrete road" (surface) into a "concrete foundation."

Again it seems pretty generally agreed that concrete roads are liable to objectionable cracking under the influence of changes in temperature and the conditions regarding moisture present. After being placed the wet concrete shrinks considerably in setting and drying, and this change of volume produces cracks in the surface. These cracks form points of weakness and *foci* of deterioration more or less serious, according to their distribution and concentration. The effort is usually made to concentrate them in regularly occurring "joints," and these joints are predeterminedly built in place with cumbersome iron or steel plates which themselves are objectionable to traffic. These "expansion joints" increase in obnoxiousness as the road gets older and wears down, and ultimately, in order to relieve this feature, if for no other reason, the coating of the whole road with a bituminous or other surface or pavement is necessary. If these "expansion joints" are not provided in the first place the concrete road surface develops cracks irregularly under alternate wetness and dryness, or heat and cold, and these cracks break away on their edges and ultimately develop into objectionable places in the surface. Apparently the only remedy then is to cover the entire surface with a carpet or pavement. The "concrete road" then becomes a "concrete foundation," and if it can be foreseen that such an end is [illegible] believes that reasons of economy demand its careful consideration before reaching a decision to attempt the concrete road construction in the first place.

[illegible]

Special machinery is not required for maintaining [illegible] advantage over such pavements as bituminous concrete and sheet asphalt. Heaters, mixers and unusual tools are not required, nor even steam rollers, for at least any but the largest jobs.

[illegible]

[illegible] clean. They are, perhaps, less susceptible to dustlessness and thorough cleanliness than is an asphalt surface or the best brick pavement; but, on the other [illegible] than [illegible] ordinary good stone block pavement.

[illegible]

This is extraordinarily low in the cases of concrete pavements, and few pavements go ahead of them on [illegible]

SLIPPERINESS.

Concrete pavements are generally more slippery than macadam and stone-block pavements (except in those cases of the latter where the joints are filled with cement mortar), but less so than wood, asphalt, bituminous pavements generally, and well-laid brick pavements.

SANITARINESS.

Concrete pavements are slightly less sanitary than bituminous surfaces and pavements, are equal in this respect to the best-laid brick, and are more sanitary than stone-block pavements or macadam.

ACCEPTABILITY.

—*i.e.*, the bases of personal or local preferences, and of æsthetic consideration and of noiselessness. As before referred to, the writer is aware that at present there exists in many minds a prejudice more or less strong toward the selection of concrete for the road surface regardless of facts. That the propriety of this state of affairs may sometimes be successfully questioned he has attempted to show. As to æsthetic considerations, it may be noted that the glaring effect of the mortar in the concrete is frequently objectionable even when dark-coloured stones are used for the aggregate. On the other hand, a light colour of the concrete may be beneficial for unlighted roads through woods, especially where there is much travel at night. As to noiselessness, concrete pavements offer slight objections on this count. They are productive of more noise than bituminous surfaces and pavements, or than macadam, but of less than brick or stone blocks.

FAVOURABLENESS TO TRAVEL.

Concrete pavements are somewhat less favourable to travel than macadam or bituminous surfaces and pavements, and more favourable than stone blocks or brick in that their surface rigidity lies between the two types mentioned. An extremely rigid, inelastic

surface is objectionable to passengers over it, even when the vehicular devices for lessening the inevitable shocks are of the highest efficiency. Animals naturally prefer the softer materials on which to tread, especially when unaccustomed to metalled or paved roads. As the proportion of surfaced or unsurfaced roads increases, the latter objection to concrete is somewhat reduced. Complaints have reached the writer from motorists using newly completed stretches of concrete roads that an unpleasant vibration was noticeable to the passengers in going over such roads, and it seems probable from the descriptions and the writer's own experiences that such vibration was due to minor unevennesses in the surface unnoticeable to the eyes or at low speeds. If the speed be high enough this vibration can be detected on the best concrete roads, though it seems imperceptible on macadam or on good bituminous surfaces and pavements.

Those who lean toward "concrete roads" (using the term as, perhaps, it is more loosely and generally now applied) may attempt to meet the objections offered above by the writer to concrete roads under his definition of the term by suggesting, as is so frequently done, that the removal of nearly all grounds for objection and a considerable strengthening of the arguments for the more general use of concrete for roadways may be had by providing a bituminous surface on the concrete.

Now this point is the rock on which it appears that so many commanders of the good ship "Economy and Efficiency" have come to grief. If the concrete layer is finally to be treated as a foundation, why go to the extra expense necessary for even fairly successful use of it as a surfacing? Why make it a 1:2:4 mixture if a 1:3:6 has been so often satisfactory? Why pay for floating and otherwise finishing its surface if this can be just as well avoided by finally surfacing with a bituminous material? Why bother with, and pay for, unnecessary expansion joints? Foundations seldom have required them.

The reasons for separating the consideration according to the definition proposed at the beginning by the writer he hopes may now be apparent. After all, when a concrete layer is to be covered by a bituminous carpet, or by a block pavement, are not the considerations regarding the concrete those old ones of sufficient thickness and strength to enable it to perform its purposes, of its composition with gravel or broken stone as may be desirable for economy in first cost, and generally and identically those of any concrete foundation or base for a road surface? And then, as regards the surfacing layer, are they not the same old ones of character, of thickness, of composition—all to fit best the local conditions?

There certainly is room in the practice of highway engineering for the better and more scientific selection of road crusts. Many are, doubtless, familiar with instances of good pavements that have satisfactorily survived many years on a cheap gravel or sand foundation with only reasonable charges for maintenance, and as familiar with other cases where economy would evidently have been had from the installation of a concrete foundation in the first place. It really seems to the writer that the far larger part of the consideration concerning "concrete roads" (using the term in its broadest, and perhaps at present more general, sense) were composed of two main parts—first, as to the advisability of providing a concrete foundation for the surfacing, and, second, the determination of the character, composition and thickness of the latter.

If highway engineers will but regard the facts in the matter calmly and conservatively, and proceed carefully and steadily past the siren songs of the cement-concrete promoters, the writer feels that time and money will be saved, and that their reputation as engineers will be enhanced.

Roadmen's Wages in Ayrshire.—It was reported to the Northern District Committee of the Ayrshire County Council recently that the surveyors had drawn attention to the difficulty they were experiencing at the present time in connection with their road surfacemen leaving for other employment where better wages could be obtained. After consideration by the Works Sub-Committee it was agreed in the special circumstances to grant a general increase of wages to the men whose wages were under 5s. per day, to take effect as at next pay, the increase to be a minimum of 2s. and a maximum of 3s. per week.

BRIDGE CONSTRUCTION IN BOLIVIA.

JUNIOR INSTITUTION OF ENGINEERS LECTURE.

At a meeting of the Junior Institution of Engineers held recently, Mr. Chas. W. Glover, jun., spoke upon the subject of "Bridge Construction in Bolivia."

In the course of his remarks Mr. Glover pointed out that the high cost of bridge material in Bolivia is due to the enormous distance over which material has to be shipped, and to the difficulties experienced in transporting cumbersome girderwork. All bridge material is imported from the United States or Europe, and costs anything from twice to three times the corresponding London price, dependent, of course, upon the location of the site. Native labour, both male and female, is, however, cheap; for natives, when working on contract, will execute approximately as much work as an English labourer for half the latter's pay in England. Supervision is, however, expensive, as this can only be entrusted to white employees.

Evidence of very small stone spans constructed by the Incas still remain, but the Spanish invasion of 1631 marked a new era in bridge construction, and at present bridges of all classes, but mostly of small span, are to be seen in every town or village. Owing to the mountainous nature of the country very heavy vehicular traffic is not encountered, and the road bridges are usually of quite primitive and light construction. The small suspension bridges at the approaches to the Yungas district and the larger suspension bridge on the Potosi-Sucre coach road are examples worthy of note. Heavy bridge building is therefore practically confined to railways.

It is with the design of abutments that the greatest troubles are experienced, the attendant difficulties being usually traceable to the proximity of "mazamorra," or mud river. In Bolivia the "mazamorra" occurs most frequently on the Oruro-Cochabamba line, where seventeen big "mazamorras" are crossed in a distance of 37 kilometres (23 miles).

When properly drained and sun-dried these "mazamorras" are quite hard, and present foundations which are apparently quite firm, but a ten minutes' rain storm is often quite sufficient to render each a huge moving mire which will carry away any bridgework unwarily constructed upon it in the dry season. Piling for foundations is not practicable owing to the frequent occurrence of rocky boulders, which intersperse this "mazamorra" material, and blockwork foundations constructed upon it seldom settle, but often indicate lateral motion.

Owing to the "heaping up" effect described, "mazamorras" will often completely bury bridges constructed to span them. Under-bridges have in many cases been substituted by over-bridges, or timber chutes, but each have proved to be quite inadequate to cope with the enormous load imposed upon them. Masonry "cut and cover" structures have been suggested, but have now been superseded by the reinforced concrete tube, well anchored, and so constructed as to carry the railway through the "mazamorra."

Reinforced concrete construction, thought the speaker, will in future be greatly developed in Bolivia. Skilled labour and good supervision for this class of work is, however, not easily obtainable, and this, coupled with the fact that Portland cement is so dear (£1 to £3 per barrel of 400 lb.), offers the greatest obstacle to the development of reinforced concrete construction.

Mr. Glover illustrated his remarks with lantern slides made from his own photographs.

Chiswick and Motor Traction.—At the last meeting of Chiswick Urban District Council, Councillor Harvey spoke of the difficulty experienced by the local authority in obtaining horses. The only animals they could get were those termed "Army throw-outs," which were of no use to the council. Horses could not be hired because they could not get the men with them. The council had three horses sick at present, and the Horses Sub-committee thought the council should seriously consider the question of motor traction in the future, as no doubt horses would fetch a very big price. The chairman, Mr. J. Leith, J.P., suggested that a special committee should be appointed to consider the matter of motor traction, and this the council agreed to.

The Purification of Waste Liquors from Fellmongers' Yards and from Tanneries.—(3.)

By G. BERTRAM KERSHAW, M.Inst.C.E., M.Inst.M.E., Late Engineer to the Royal Commission on Sewage Disposal.

[redacted]

Both trades are met with in [redacted] small, throughout England.

In fellmongering [redacted] fellmonger to deal with sheep and lamb skins, removing the wool, the skins being then dispatched to the tanner to be further dealt with.

Methods vary somewhat in individual yards, a very [redacted]

[redacted] to soften them and to remove blood and dirt. When the business is carried out on a large scale, the skins [redacted] They are next either placed in brick pits containing milk of lime, or painted on the flesh side with lime [redacted] of arsenic sometimes being used in conjunction with lime. The skins are then taken in twos, laid together [redacted] twenty-four hours.

The effect of the lime is to dissolve the roots of the wool, so that it can be pulled off by hand, and the skin scraped clean. Formerly, the skins were hung up in a damp, warm room to induce putrefaction, [redacted] apt to cause damage to the skins when the wool is removed. The flesh removed from the skins is usually sold for making gelatine and glue. The skins, or [redacted] and "plunged" with wooden rods. In cases where the skins have to be sent some distance to the tanner, they receive a further soaking in lime water for three to four days in order to preserve them.

The liquors resulting from fellmongering consist of "soak" water, sometimes water from the "burring" machine, liquor from the lime pits (or "limes"), and liquor from the washing of the skins, together with a mixture of the various liquors which drip to the floors from the skins while they are being handled. All these liquors are of a grossly polluting character, but especially those discharged from the "limes" [redacted] renewal. Formerly the limes were used for a considerable time before being renewed, but it was found that this was detrimental to the skins, and the usual period for which the lime pits are now run is from two to four days.

The combined wastes contain large quantities of dissolved and suspended organic matter, taking up large quantities of oxygen very rapidly if discharged into a stream; they also contain large amounts of lime salts, together with much fibre.

Fellmongers do not use anything like the volume of water required by tanners, a [redacted] turning out perhaps [redacted] daily. As a general rule, most fellmongers' yards are situated in towns, and in such cases the question arises as to preliminary treatment prior to admission to the town sewers.

Undoubtedly the mixed wastes should be carefully settled in large catchpits or small settling tanks, which are kept carefully attended to, and cleaned out when necessary. Moreover, a suitable screen should be provided to intercept wool fibre, which, in conjunction with the precipitating action brought about by the lime salts, is very apt to cause trouble by rapidly silting up sewers, especially if they happen to be of small diameter, and [redacted] a shallow invert flow normally.

Turning to isolated cases, where the fellmongers' yard may be situated far away from sewers.

In such cases good settlement in tanks would be advisable for preliminary treatment, followed by filtration through percolating filters, or treatment upon land, if this can be obtained and of suitable quality.

In either case a low rate of filtration would be essential with such a strong liquid—probably little in excess of some 25 gallons per cube yard per twenty-four hours. The sludge has a certain manurial value, but it is difficult to dispose of in towns.

With regard to the arsenic frequently present in the combined waste liquors, and the likelihood that it may exercise a sterilising effect upon filters, this point will be touched upon in the tannery section, from which it will be seen that certain experiments have demonstrated fairly conclusively that this is not likely to occur.

In conclusion, it is well to bear in mind the fact that most fellmongering businesses are small, and [redacted] purification works.

[redacted]

[redacted] quently been the cause of trouble arising from pollution of streams in many localities. Various tanning substances are used—viz., chrome, oak, wattle, sumach and other barks, oil, alum, &c., certain tanning materials being better suited for producing particular types of leather than others.

Dealing with the oak-bark process first, the procedure to which the skins (usually bullock hides) are subjected before the tanning process proper, consists in soaking them for from two to eight days in small brick tanks, measuring about 6 ft. by 4 ft. by 4 ft. deep, filled with water. This process is termed "soaking." The skins or hides from abroad, when they arrive at the tannery, are often very hard, some being sun dried, while Continental and American hides are salted, and the "soaks" soften the hides, removing the salt* from the salted ones and the blood from fresh hides received direct from the butchers. The water in the soak pits is changed from time to time when it becomes too foul.

After leaving the soak pits the hides are placed in pits containing lime water, where they remain for from about six to twenty-four days, according to the nature of the particular batch of hides being treated. This liming process has the effect of swelling the hides or skins, making them soft and flaccid, so that the hair is loosened and the pores of the skin opened, allowing the subsequent tanning solutions to permeate them better. The contents of these lime pits, or [redacted] they are infrequently emptied, except in hot weather.

After the skins are removed from the lime pits, they are placed on a "beam" and scraped on both sides with a blunt two-handled scraper resembling a carpenter's draw-knife, this process resulting in the removal of the hair, lime and grease. In the case of skins intended for soft leather, a "pure," or "bate," is employed, these consisting of fermenting solutions of dog dung and pigeon or fowl dung respectively. The action effected by this treatment appears to be very largely bacterial, and it renders the skins flaccid.

After rinsing the skins are now ready for the tanning process proper, being first suspended in pits in the tanning liquor, and subsequently laid flat in pits with a layer of tanning substance between each skin. The duration of the tanning process varies from two to four days to as much as six to eight months for high-class sole leather.

The waste liquors produced are very polluting, particularly those derived from the liming and puring, and their treatment is a matter of some difficulty. Messrs. Wilson & Calvert, in their book on "Trade Waste Waters,"† give, among others, figures for three "hour average mixed refuse" samples, as shown in the table which appears on the next page.

The figures show the polluting nature of the mixed [redacted] before discussing their treatment, it may be well to mention briefly another process which is very largely used in this country—namely, chrome tanning.

In the process of chrome tanning, used for goat and calf skins, the skins, usually in batches of about fifty, are soaked in brick tanks for about six hours, during

* Naphthalene is sometimes used in the case of [redacted] hides.

† Chas. Griffin & Co., Limited, London.

which time they receive about three changes of water. They are next placed in brick* tanks containing lime and water (and sometimes a little sulphide of arsenic), where they remain for about three days, lime being added from time to time.

De-hairing of the skin is the next process often effected by special machines provided with a fluted brass roller which removes the hair. After de-hairing the skins are placed in wooden vats containing a solution of lime and sulphide of sodium, which is used to give certain qualities to the leather. The skins generally remain in this solution for about twenty-four hours. After the sulphide bath the skins go to the "beams" to be scraped; they are then washed in revolving drums for about thirty minutes, running water being used.

After being drummed, the skins are placed in a wooden vat containing dilute acetic acid, after which they are washed again and transferred to the tanning solution, which is composed of reduced bichromate of potash and sulphuric acid, the solution being applied to the skins in revolving wooden drums. The skins remain in the chrome drums for about five or six hours, when the solution is nearly exhausted, and it is run off to waste.

After tanning the skins are bluish-green in colour when wet, but they become white on drying. In some tanneries a hypo-sulphite solution is used after tanning to neutralise any acidity. Dyeing is effected after the tanning process, black or yellow dyes being most frequently used, the skins being washed once before dyeing and several times subsequently. The skins are next squeezed by a special machine, in order to express the water, and they are finally shaved by another appliance.

The liquors resulting from the soak and lime pits, de-hairing, first waste-waters, sulphide bath and tanning, are all of them polluting, the actual degree of pollution varying somewhat, according to the length of time a particular liquor has been in use. There is also a considerable quantity of foul liquor draining off from the floors, derived from the handling of the dripping skins when removed from the several processes.

Many other tanning processes are employed—*e.g.*, oil tanning in the manufacture of chamois leather and buckskin, cod-liver oil being used and forced into the skins, when they are stored in a warm room and afterwards placed in a weak solution of alkali. Alum tanning is used for glove leather (as at Yeovil), alum, flour, and yolk of egg being drummed into the skins, after which they are scraped and dried. When dyed leathers are required, aniline dyes are now very largely used, together with log-wood and fustic, and mordants are often used for fixing purposes.

Coming to the volume of waste liquors discharged from tanneries. A medium-sized tannery will possibly use some 20,000 gallons of water daily, but the quantity varies greatly, and it may be as little as 2,000 gallons to as much as 80,000 gallons daily. Further, it must be remembered that the mixed wastes are most polluting when discharged into a river or stream in their crude state. The lime liquors and the tanning substances, it is true, tend to neutralise one another and cause a copious precipitation, but this needs to be carried out in properly designed precipitation tanks, and not allowed to take effect on the bed of the sewers. The effect of tannery wastes on streams containing iron is to blacken the bed of the stream, giving the flowing water the appearance of ink for some time afterwards, although the actual pollution may not have been recent. As a preliminary treatment, good precipitation in tanks is indicated, and it is frequently necessary not to rely solely upon the natural precipitation caused by the mixed wastes, but to add additional precipitants, such as lime and sulphate of alumina.

* Iron and steel tanks cannot be employed for use in tanneries, since the skins would be damaged by their use.

Screens are advisable when the tank liquor is discharged into the sewers.

Tillmans mention that tannery liquors when run direct to drains frequently cause trouble when they contain sodium sulphide, and come into contact with acid effluents, like those from breweries, the sulphuretted hydrogen which result causing great annoyance in the streets. He further mentions that arsenic and other poisonous substances must be removed before any biological purification is taken in hand.

Parts per 100,000.

Do. do. ...	131	214	7	3·8	69

Now, as regards the action of arsenic upon nitrification at filters, it will be of interest to turn to some careful experiments which were made by the Massachusetts State Board of Health.* These experiments were conducted with tannery liquors in order to ascertain how much arsenic might be present in a sewage without seriously interfering with its purification by filtration, and also to see whether the proportion of arsenic ordinarily present in tannery wastes would prevent the starting of nitrification in a new filter. Two sand filters, 3 ft. 6 in. deep, were used, and settled sewage was applied at a rate of 100,000 gallons per acre daily, arsenic being added to one of the filters in the proportion of ·15 part per 100,000.

The filter receiving arsenic took four weeks to produce nitrates, while the filter which did not receive arsenic took seven weeks. Further experiments were carried out with two new filters, arsenic being added to one of them in the proportion of 2·5 parts per 100,000. The results were as follows:—

	Settled Sewage.	Settled Sewage plus Arsenic.
	Nitrate in parts per 100,000.	
After two weeks ...	·23	·1
,, three ,,	·72	1·0
,, four ,,	Nitrification equal	active nitrification.

The dose of arsenic was gradually increased to as much as 400 parts per 100,000, without any decrease in nitrification occurring. On increasing the dose to 500 parts of arsenic per 100,000, however, nitrification was effectually checked, and could not be again re-established. The arsenic was applied as As_2O_3 dissolved in sodium carbonate, and made nearly neutral. From the foregoing it would appear to be exceedingly improbable that the quantity of arsenic found in ordinary tannery wastes would exert any inhibitory action upon biological filtration.

Considering supplementary treatment, there are, so far as the writer is aware, no tannery waste liquor purification plants which are giving what might be termed satisfactory results, and this could hardly be anticipated, having regard to the inadequacy of many of the existing plants, and the carelessness with which they are worked. There is no doubt whatever that tannery wastes can be purified by biological treatment, either upon land or upon filters, but a large area of either (1) suitable land or (2) filters would be needed. Contact beds could be employed, but triple contact would certainly be necessary, and percolating filters would generally be preferable.

Wherever practicable, dilution of the wastes with water *after* tank treatment, and before further treatment upon filters or land, would be beneficial. In any case it would probably be impracticable, at any reasonable outlay, to produce an effluent of the same degree of purity as could be obtained from a sewage, and a tannery effluent might be regarded as sufficiently purified if it did not contain, say, more than 4 to 5 parts of suspended matter per 100,000, while not taking up more than a similar amount of dissolved oxygen in five days. Typical such results, however, the purification works would not only require careful

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

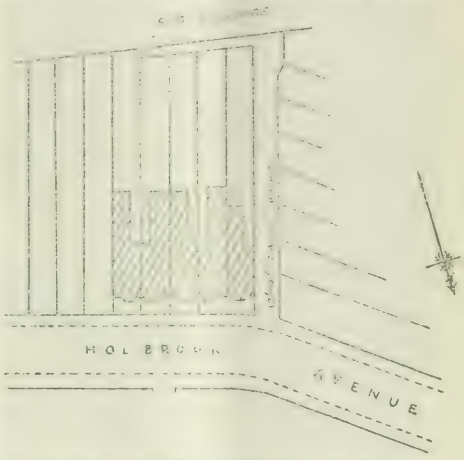
The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

ALLEGED NUISANCE: COMPLAINT DISMISSED: CLAIM FOR DAMAGES: PUBLIC HEALTH ACT, 1875, SECS. 91-96. An unusual point in connection with proceedings to abate an alleged nuisance was decided in *Bailey v. Rodgers* (the Law Reports, Division Court of Appeal). The defendant Bailey (who was the sanitary inspector of the council), having made an inspection of a house at Romford in the occupation of the plaintiff, served a notice on him, under sec. 94 of the Public Health Act, 1875, requiring him to abate an alleged nuisance on the premises. The notice not being complied with, Bailey, purporting to act upon the instructions of the council, preferred a complaint against the plaintiff before the magistrates under sec. 95 of the Act. The magistrates, however, dismissed the complaint, and allowed the plaintiff £5 5s. costs. The plaintiff then brought this action, claiming damages for malicious prosecution. The council, in their defence, denied (1) that they had not reasonable and probable cause for preferring the complaint, and (2) that they had acted maliciously. The case was tried before Mr. Justice Horridge and a jury. The jury answered the questions left to them as to reasonable and probable cause and want of *bonâ fides* in favour of the plaintiff, and assessed the damages at £250 against the council only. Mr. Justice Horridge held that the complaint under sec. 95 was a proceeding involving damage to the plaintiff's fair fame sufficient to support the action, if the complaint had been preferred maliciously and without reasonable and proper cause, and he gave judgment for £250 against both defendants. The Court of Appeal reversed this decision, and gave judgment for the defendants. Lord Justice Buckley said that an action of malicious prosecution would not lie unless the plaintiff could show that he had suffered one of three sorts of special damage—viz., (1) damage to his fame, as if the matter whereof he was accused was scandalous; (2) damage to his person; or (3) damage to his property. There was no question here as to damage to property, nor was there a danger of imprisonment; but the plaintiff, to succeed under the first head, must show that damage to his fair fame was the natural and necessary consequence of the proceedings he complained of. The complaint was, in a sense, a criminal proceeding, but the imputation conveyed by it did not necessarily attack the fair fame of the person against whom it was made. It might well be that the occupier of the premises was not in any way responsible for the existence of the nuisance. For these reasons he thought the judgment of Mr. Justice Horridge was wrong, and that the action was not maintainable; also that the findings of the jury were against the weight of evidence and inconsistent with another, and that the damages were excessive.

QUERIES AND REPLIES.

In order to avoid confusion, queriists are requested to use distinctive words as nom de plume. The letter X, combinations such as XYZ, the words such as "engineer" and "surveyor" should not be used.

BY-LAWS: SECONDARY MEANS OF ACCESS.—"Access" writes: Plans have been submitted to [illegible] By-law Nos. 7 and 10 in force in the district call for a secondary [illegible] the removal of house refuse and other matters. (Copy of By-laws 7 and 10 forwarded.) It has been the custom to allow a passage of about 3 ft. between the houses to serve from two to four houses as the secondary means of access. The plans now deposited [illegible] to serve the five houses. This plan has been disapproved on the grounds that it does not comply with By-law No. 7. The owner contends that the council has no right to disapprove the plan upon these grounds, neither has the council the right to say what width the secondary means of access shall be, nor as to the number of houses it shall serve, inasmuch as a passage as shown does not constitute a new street. The word street, as defined by the Public Health Act, 1875, includes footway, square, court, alley, or passage, whether a thoroughfare or [illegible]. This being so, [illegible] A passage placed between



[illegible] more houses (four in all)—does this constitute a new street, and, if so, has the council right to allow the passage to be only 3ft. wide; (c) a passage placed at the rear of the houses, as shown on plan—does this constitute a new street?

[TEXT [illegible] BY-LAWS.]

(7) Every person who shall lay out a new street which shall not be intended to form the principal approach or means of access to any building, but shall be intended for use solely as a separate means of access to any premises for the purpose of removing therefrom the contents of the receptacle of any privy, or of any ashpit, or of any cesspool, without carrying such contents through any dwelling-house or public building, or any building in which any person may be or may be intended to be employed in any manufacture, trade, or business, shall so lay out such street that the width thereof shall be 12 ft. at the least.

[illegible] which shall be intended for use as the principal approach to any building, shall provide in connection with such street and communicating therewith, or with some other street, a secondary means of access, where necessary for the purpose of the removal of house refuse and other matters.

[illegible] statutory defin[illegible] new street." (b) The same answer will apply to the first part of the query. The council cannot legally approve the [illegible] By-law.

COVERED STREAM.—"Acme" writes: The dotted line on the accompanying sketch shows the course and direction of a covered stream under streets and property before emptying into the river. The street A was sewered by the local authority thirty years ago, and at the same time surface-water gullies were fixed in the street and connected with the stream as shown, in order to avoid the surface water passing into the foul sewer. Does this act of the local authority constitute the stream for the length of this property a sewer vesting in the local authority? At the

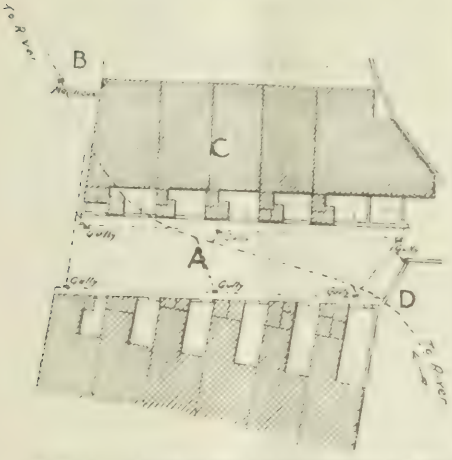
point B, and at a date previous to the street being paved a water main was laid in the street by C for the purpose of taking water to his works, which abut on the roadway street. At the present time the stream from the weir for the full length of the property to



the point D is blocked with silt and rubbish, and this causes the water in times of heavy rain to back up the surface-water gullies and flood the street. What is the position of the local authority in the matter? Can they or the property owners affected call upon C to take up the weir, and so remove the obstructions to the free flow of the water after so long a period? Or could C be proceeded against for a nuisance? Or does it devolve upon the local authority to cleanse the stream?

"In my opinion it is doubtful whether the stream is a "sewer" vested in the local authority. A conduit for surface water *may* be a sewer per Lord Justice A. L. Smith in *Eyre and v. Hollins Land and Building Company* 1893, 2 Q.B., at p. 144]). But I can find no instance in which a natural stream, *not* polluted by sewage, was held to be a "sewer," and in every case in which a natural stream has been held to be a sewer (so far as I can find) the ground of the decision was that the stream had been used for conveying sewage. See *Falconer v. South Shields Corpora-*

[illegible] prescriptive right to obstruct the stream as against other [illegible] to assume a public character. The [illegible] a public nuisance and [illegible] action to the [illegible]

[illegible] carried out, and these are some £200 above the surveyor's estimate. The surveyor is asked to carry out the work, and has to put on many extra hands, and has to put in much overtime. The work is eventually carried out for £50 below his estimate, and £160 below the lowest tender. Would not the surveyor in this case be doing the work of a contractor? Would he not reasonably be entitled to at least half a contract [illegible] A surveyor taking a post and undertaking to give his whole services. Does not this refer to services of a surveyor and conducting of duties connected with [illegible] staff of men? Could he not reasonably expect extra if called upon to carry out any extensive works? (3) A surveyor appointed for twelve months is not reappointed, but is still acting at the end of three years. Is he still bound by the terms of the first appointment? (4) A surveyor also appointed as [illegible] engineering work in connection with waterworks. Could he [illegible]

[illegible] of a surveyor's duties. It would appear, however, that the only way in which extra remuneration can legally be paid [illegible] salary for a specified period, commencing not sooner than [illegible] p. 451. (2) This would depend upon the terms of the engagement and the nature of the works. (3) Yes, in the [illegible] a claim would seem reasonable.

"THE SURVEYOR" SPECIAL ISSUE.

FEATURES OF NEXT WEEK'S NUMBER.

In the Special Annual Issue of THE SURVEYOR to be published next week the customary comprehensive list of the works projected for 1915 by the various local authorities will, as usual, be preceded by a series of articles contributed by specialists reviewing the progress which has taken place during the past year in connection with road work, sewerage and sewage disposal, water supply, refuse disposal, street lighting, electricity supply, housing and town planning, bridge construction, tramways, street lighting, and the provision of public buildings.

The legal precedents and legislation of 1914 in relation to municipal engineering will be reviewed by the law editor, Mr. J. B. Reignier Conder, while another valuable feature of the issue will be a survey of the year's literature of municipal engineering.

A special article on "Groynes and Sea Walls" will be contributed by Mr. A. T. Walmisley, M.INST.C.E.; the new Johannesburg town hall and municipal buildings will be described and illustrated; in addition to which there will be the customary reports of municipal works in progress and projected, law notes, local government inquiries, assistants' and students' section, and the fullest information relating to vacant appointments, municipal contracts and competitions.

To non-subscribers the price of the Special Issue will be 1s., but subscribers will receive their copies without extra charge.

Rural Surveyor Anxious to Enlist.—The surveyor to the Stafford Rural District Council, Mr. Frank Ideans, being anxious to join the colours, submitted the matter to the Highways Committee, who recommended that his position be kept open, and that he be allowed £100 per annum. When the subject was discussed at the council meeting, however, it was pointed out that there might eventually be a modification of his position owing to the extension of the Stafford borough boundaries, and upon this plea the committee's recommendation was referred back.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

451. Hydraulics. Sketch a practical form of hydraulic ram for raising automatically to a considerable height a portion of any volume of water derived from a lesser height, and explain the points upon which satisfactory working depends.

452. Wells. What are (1) A deep well, (2) a shallow well, (3) an artesian well, and (4) an Abyssinian well? Give definitions. (G. C., *Wigston Magna.*)

453. Building Construction. Draw a section showing the construction of a flat asphalted roof, carried on timber joists 10 in. by 2½ in., roofed below the walls to form of 14 in. brickwork, surmounted by a 9-in. parapet, 2′ 0″ high, coped with stones, the section to run across the joists and through the parapet walls. ("Ajax.")

454. Foundations.—What should be the composition of concrete for the foundations of a factory chimney shaft? Would lime concrete be suitable? (Ajax.)

NOTES.

449. Roof Truss. The accompanying diagrams show the stresses in the members of the roof truss illustrated in the "Assistants' and Students' Section" last week, when subjected to the loads and wind pressure indicated.

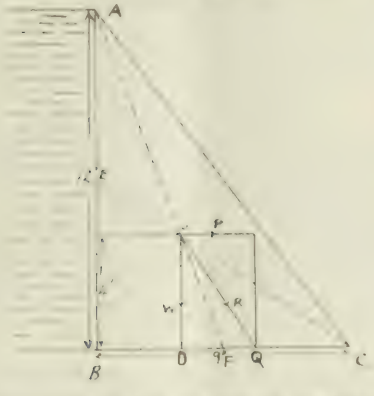
STEEL ROOF TRUSS 10-FT. CENTRES

REPLIES TO QUESTIONS.

450. Masonry Dam.—The inner face of a masonry dam is a plane vertical surface 12 ft. in height. The section of the dam is a right-angled triangle 9 ft. wide at the base, and the weight of the masonry is 125 lb. per cubic foot. When the reservoir is filled to the upper edge of the dam, find the point at which the resultant pressure intersects the base. (A.M.I.C.E.)



Consider the dam to be 1 ft. in length, and therefore the volume of the dam $= \frac{12 \times 9}{2}$ cu. ft.

Weight of dam $= 54 \times 125 = 6{,}750$ lb.

The resultant pressure intersects the base at the point of intersection of the vertical centre of gravity of the section of the dam ABC.

Let the line of action of this weight meet the base at D.

The pressure of the water = WAH.

where W = Weight of one cubic foot of water
= 62·3 lb.
A = Area of surface of dam
= 12 sq. ft.
H = Head of water at centroid of surface.
= 6 ft.

Pressure of water $= 62{\cdot}3 \times 12 \times 6$
$= 4485{\cdot}6$ lb.

This pressure acts horizontally at a distance $\frac{1}{3}$AB = 4 ft. from the base of the dam;

∴ its line of action passes through O.

W = 6750 lb. is represented to a suitable scale by OD = 4 ft.

P = 4485·6 lb. is represented to the same scale by $\frac{4 \times 4485{\cdot}6}{6750} = 2{\cdot}66$ ft.

On completing the parallelogram formed by the two forces W and P, we find that their resultant meets the base at Q.

But DQ = P = 2·66 ft.

The distance of Q from B = BD + 2·66 ft.

But BD = $\frac{1}{3}$BC = 3 ft.

∴ Distance of Q from B = 3 + 2·66
= 5·66 ft.

or from C = 3·44 ft.

(N. W. K., *Barry St. Edmund's*.)

Military Traffic in Norfolk.—The county surveyor of Norfolk, Mr. T. H. B. Heslop, has reported to the Western Highways Committee that considerable damage had been done to the main roads by military traffic. Under the traffic of troops and guns, footpaths had been absolutely destroyed. The flint roads had also been badly damaged by the passage of guns and horses. The damage must be repaired. He was under the impression that the cost of repairs must fall upon the county, but he had learned from the Road Board that any reasonable damage would be made good by the authorities. He proposed to have the work of repairing carried out, and to send in the bill to the Road Board. He had laid the facts before the board, and would prefer to send in a bill for the cost of repairs rather than an estimate.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Colne T.C. (January 14th. Mr. F. H. Tulloch). [illegible] gasworks [illegible] and [illegible] [illegible] The total amount [illegible] is proposed to be raised in 1914 from the [illegible] of Dudley at [illegible] 1 × 3/4. There were no [illegible]

Colwyn Bay U.D.C. (January 19th. Mr. A. G. Darby).—£11,000 for sewerage works. Mr. Isaac Amphlett, engineer, stated that it was intended to [illegible] from Mochdre to the [illegible] sewage farm. plans for the erection of a cliff tramway, giving easier access to the beach.

APPLICATIONS FOR LOANS.

Barnsley T.C.—£4,500 for the purpose of the electricity undertaking.

Billericay R.D.C. £1,400 for laying water mains.

Bournemouth T.C.—£4,630 for works of street improvement.

Coole U.D.C. £13,000 for gasworks extensions.

Hindley U.D.C.—£12,200 for private street works.

Holmfirth U.D.C.—£7,500 for electricity works.

Ince U.D.C.—£13,500 for a new school, and £600 for tar-macadamising.

Keith T.C.—£8,000 for a new reservoir.

Kenmare R.D.C.—£4,000 for a water supply.

Maldens and Coombe U.D.C.—£850 for surface-water sewerage.

Normanton U.D.C.—£4,000 for the extension of the sewage disposal works.

Penistone U.D.C.—£1,000 for water pumping plant.

Rowley Regis U.D.C.—£1,482 for a technical school.

Salford T.C.—£18,252 for the provision of a transformer sub-station, £25,000 for high-tension mains, and £6,533 for extensions to the Pendleton car depot.

Sculcoates R.D.C.—£2,500 for a reservoir.

Shepshed U.D.C.—£1,450 for the purchase of a site for a housing scheme.

Taunton T.C.—£3,450 for the provision of public baths.

Truro T.C.—£10,000 for the electricity undertaking.

Yeovil T.C.—£1,155 for the construction of an overflow sewer.

LOANS SANCTIONED.

Barnsley T.C.—£400 for road widening.

Broadstairs U.D.C.—£2,650 for the provision of a depot.

Chelmsford T.C.—£620 for the provision of slipper baths.

Criccieth U.D.C.—£3,294 for workmen's houses.

Harwich T.C.—£2,114 for road improvement.

Hungerford R.D.C.—£1,500 for workmen's houses.

Poole T.C.—£586 for street improvement, and £336 for surface-water drainage.

Radcliffe U.D.C.—£4,500 towards the cost of a joint sewerage scheme.

Stafford T.C.—£13,700 for a new gasholder, and £20,000 for vertical retorts.

Stanley U.D.C.—£3,000 for laying out a public park.

Tiverton T.C.—£150 for works of water supply.

Woking U.D.C.—£2,081 for making up certain roads.

PROFESSIONAL MEN AND THE WAR.

To the Editor of THE SURVEYOR.

SIR,—I should be glad if you would again grant me space in your journal to discuss recruiting for the Army.

The Architects' War Service Bureau is in a position to advise professional and business men and men of skilled trades as to the branch of the Forces in which they can best serve the Government and for which they are personally most suited.

More particularly we are recruiting for the Royal Engineers and Sanitary Companies. But we are also at present making a special effort to recruit a gun section for the R.F.A. Howitzer Reserve, to be composed of professional and business men, who will serve together.

Lastly, since the War Office have officially recognised the Volunteer Training Corps now existing in London, no man, whatever his age or circumstances, has any excuse for not being a member of a military organisation. Those who can join the Regular Forces should do so at once; those who cannot, should join the Architects' Volunteer Training Corps, which is recognised by the Architects' War Committee, the Surveyors' Institution, the Auctioneers' and Estate Agents' Institution, the Junior Art Workers' Guild, and the London Master Builders' Association. By doing so they can materially help the recruiting authorities to distinguish between the "willing" and "unwilling" members of the community.

All recruits should apply direct to 18 Tufton-street, Westminster, S.W.—Yours faithfully,

ALAN POTTER.
Hon. Recruiter, A.V.T.C.

January 19, 1915.

THE BALTIC TIMBER TRADE.

To the Editor of THE SURVEYOR.

SIR,—As the originator of the query in your issue of December 25th "whether it is a fact that the Baltic timber trade is mainly controlled by Germans," I note (not without satisfaction) that such a view is, in your issue of January 8th, stigmatised by a contributor, who claims to know, as "absolute nonsense."

Strong as this assertion is, greater conviction would be felt by reliable facts being adduced to controvert the above-mentioned view, which I may say is based upon first-hand information obtained during a recent visit to Sweden, from a leading Berlin commercial financier. It is but right to say that he expressly excluded the Bergevik Company, much of the capital of which is, I believe, held in this country.

The undoubted fact that the Germans have very large financial and commercial interests in Sweden, coupled with the significant circumstance that a large number of timber-importing firms bear German names, seemed to lend colour in confirmation of my informant's statement.—Yours, &c.,

W. H. S.

January 19, 1915.

Welsh Tramway and Sewerage Bills.—The Aberdare Urban District Council (Tramways) Bill, and the Monmouthshire Eastern Valleys Joint Sewerage Bill on Tuesday passed the examiners, and were sent for first reading when Parliament meets.

Proposal to Erect Three Thames Bridges.—At the meeting recently of the Thames Conservancy Board, provisional acquiescence was expressed with the plans for three new bridges across the Thames. One of these would be constructed across the river between Goring and Streatley, and the other two, it is suggested, should be erected between Reading and Caversham.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this heading as complete and up-to-date as possible.*

[illegible] Borough Surveyor, Rural Surveyor, Surveyor and Engineer, Engineer and Surveyor, Engineer, Engineer and Manager, Engineer and Surveyor, Engineer and Surveyor, Engineer and Surveyor

with barely sufficient team labour to perform the ordinary removal of the house refuse of the town. Of course, this put an end to the work of cleansing which the department was carrying out in the camp. Notwithstanding this, however, the divisional barrack officer called upon him to inquire if it were possible for the council to undertake the scavenging work of the camp permanently. It also prevented his executing the street cleansing that was so urgent in the recent foul weather. The council agreed to give the Highways Committee power to purchase six horses.

ROADS AND MATERIALS.

Berwickshire C.C.—A sub-committee appointed to tar-spray the streets at Earlston has reported that the work had been carried out, and the result was quite satisfactory so long as the weather was dry. There was also a considerable diminution in dust. Since the setting in of the wet weather the appearance is not so good. It was referred to the sub-committee to watch the behaviour of the surface during the winter and to report to the next meeting of the West District Committee. The total cost was a little over £140, half of which is to be refunded by the Road Board.

Bournemouth T.C.—The council have accepted the tender of Messrs. William Griffiths & Company, Limited, at £6,336, for laying wood-block paving in Holdenhurst-road from Lytton-road to Richmond Park-road, also the tender of Mr. J. Francis at £649 for the making up of the Southbourne Overcliff Drive-road.

Camberwell B.C.—The council have passed an estimate of £2,651 for repairs to the Crystal Palace parade, and have asked the Road Board to make a grant in aid of the work.

Chiswick U.D.C.—Arrangements have been made to deal with the wood paving of Bath-road at a price which is 1s. a yard above the original tender, but which will be a saving compared with what would have to be paid in mere repairs if the present arrangement was not carried out.

Clacton U.D.C.—The council have approved the report of the surveyor, Mr. D. J. Bowe, for additional work required to complete the West Cliff improvement. The estimated cost is £450.

Deptford B.C.—The council have approved a report prepared by the borough accountant, outlining a scheme for equating the expenditure on highway purposes over the next six years, by which the council would be able to defray the cost of repaving New Cross-road. It appeared that the income of the fund would be a uniform charge on the rate of £16,000 per annum, out of which would be paid the ordinary highway maintenance expenses, and the capital charges in respect of permanent paving works defrayed out of loan.

Derby C.C.—The council have approved the recommendation of the Highways Committee for the improvement of the bend in the main road between Chapel-en-le-Frith and Hayfield, at an estimated cost of £400, apart from the purchase of the land. Many other proposals for widenings, which the Highways Committee have considered at the instance of the Road Board, are in abeyance.

Doncaster T.C.—Attention was called recently to a recommendation that as the present street crossings wear out they should be taken up and the road made good without relaying the crossings, and a member asked if it meant the abolition of crossings. Councillor Wightman replied that it meant that the streets would be all crossings instead of crossings here and there, and it was intended to make the roads so that there would be no need for crossings.

Esher and the Dittons U.D.C.—The surveyor, Mr. H. C. Fread, has been authorised to arrange for the supply of rail-borne granite sufficient to keep up necessary patching-work, the contractors having intimated that, owing to shipping difficulties, they could not deliver sea-borne granite.

Exeter T.C.—The city surveyor, Mr. T. Moulding, has received instructions to carry out the street widening at the junction of Pinhoe-road and Polsloe-road. The cost of the work, including the purchase price of the land, and arbitration proceedings, is estimated at £768.

Hackney B.C.—The council are recommended to widen part of Homerton-road, at an estimated cost of £1,900.

Hammersmith B.C.—It has been agreed to undertake the diversion of Old Oak-road and the widening of Old Oak Common-lane, at an estimated cost of £1,915, towards which the Ecclesiastical Commissioners are expected to contribute £400, and the London County Council £1,000.

Manchester T.C.—The Parks Committee are steadily adding to the number of districts and thoroughfares in which they are planting trees and generally improving the scanty stock of foliage, says the *Manchester Guardian*. In all nearly 4,500 trees have been planted in the outlying districts, particularly on the south side of the city, and so successful have been the results that the inner and eastern parts of Manchester are now the scene of experiments. Tree-cultivation is being attempted in Clopton-street, Hulme, and Grey Mare-lane, Openshaw, and probably other parts of Hulme and Moss Side and Higher Openshaw will follow.

Manorhamilton (Ireland) R.D.C.—The council have passed proposals for four additional new roads, at a total cost of £1,830. The works are approved subject to assistance from the Congested Districts Board and Estates Commissioners.

Margate T.C.—It is proposed to carry out road widenings and bridge construction, at an estimated cost of £12,500, and application is to be made to the Road Board for a grant.

Marlborough T.C.—Upon the road estimates coming up for consideration it was agreed that an additional £333 be passed for the purpose of providing granite, instead of flint, on the main road from London to Bristol.

Norfolk C.C.—Reference was made at the recent meeting of the council to the difficulty of obtaining supplies of granite. In moving the adoption of the report of the Eastern Highways Committee, Mr. R. J. Colman stated that it was of the utmost importance that such supplies should be kept up as well as the council were able to obtain them. Unfortunately, owing to the demand for granite, and the consequent rise in cost, it was difficult to get consignments. The council accepted contracts last year for certain supplies, but the council could not under present circumstances obtain seaborne granite from Northumberland, and they were having to buy what they required from two other sources—namely, Guernsey and Leicester. Both supplies had risen, but at increased price.

Norwich T.C.—The council have accepted the offer of the Road Board to advance by way of loan, free of interest, and repayable by five annual instalments, the sum of £2,500, the cost in connection with the improvement of additional areas of the surface of Newmarket-road, and the town clerk has been authorised to apply to the Local Government Board for sanction to the borrowing of the money.

Romford U.D.C.—The Local Government Board, having intimated their willingness to grant sanctions for loans to carry out the proposed improvement in the main London to Colchester road, the surveyor, Mr. H. T. Ridge, has been instructed to proceed with the preparation of the specification for the work.

Rotherham T.C.—The Highways Committee recommend that the borough engineer arrange to repair the portion of Wortley-road from the Sportsman Inn to Bray Plantation at an estimated cost of £882, to be repaid out of revenue, and that the tender of Mr. H. Roberts, of Gainsborough, of £1,280 for private street works in Ridge-road be accepted.

South Stoneham R.D.C.—The surveyor, Mr. F. Heather, has submitted a report on the repair of the local roads, involving an outlay of £650. The military authorities desired the work to be started at once. The matter would have to be referred to the Road Board, and the council would be reimbursed, save as might be otherwise agreed between the local authority and the board. It was agreed that the work should be proceeded with, and thanks were accorded to the surveyor for the way he had carried the matter through.

Surrey C.C.—On the recommendation of the county surveyor, it has been decided to expend £75 on the purchase of a motor cycle with side-car attachment for the use of the assistant (who had to take with him a chain-man and the necessary instruments for measuring purposes) employed in making a survey of the dangerous curves and corners in the county. The Road Board have undertaken to pay such official's travelling expenses.

Warrington T.C.—The Health Committee have presented a report drawing the attention of the Paving and Sewering Committee to the need for paving in Oldham-road, Slater-street, Cairo-street, Peter-street and neighbouring streets in Latchford.

West Riding C.C. Included in recent estimates of the Highways Committee was an item of £92,336 for works to provide employment in distress areas. It was explained that at present there were little distress in the Riding, the proposal being put forward to safeguard the committee in the event of a period of exceptional distress arising.

Wombwell U.D.C. It has been decided to carry out works of street improvement at an estimated cost of £7,908.

SEWERAGE AND SEWAGE DISPOSAL.

Chelmsford T.C.—The accounts for the joint sewage farm presented recently showed that the expenditure of the year had exceeded receipts by £139. The Councillor Grey said, was not quite so satisfactory as in the previous two years, when a profit was shown, but the bulk of the deficit was due to work which might be considered as capital expenditure in making earth banks and similar works. They had enclosed 6 acres, and the committee considered it a very good job done cheaply. Taking the profits of the previous two years, they would find that it meant that the disposal of sewage had not cost the borough a penny for three years except in the matter of repayment of loans, &c.

Doncaster R.D.C. Messrs. Balfour have been instructed to prepare plans and specifications for additional liquefying tanks and filters at the Cusston and Skellow sewage outfall works.

Doncaster T.C.—At the meeting held recently a discussion took place on the proposal of the council to prepare a new sewage scheme for the extended borough on competitive terms, and to ask the advice of the Institution of Civil Engineers as to the conditions consistent with their institution. The proposal was carried in committee as an amendment by 14 to 13, and Alderman Carr, in moving that the motion be not confirmed, urged that the borough surveyor had already too much work to do, and said a committee had been appointed to consider how to afford relief to certain officers upon whom the extended borough had thrown extra pressure. The motion to reject the recommendation was defeated, but eventually the matter was referred back.

Norwich T.C. The balance-sheet of the Whitlingham Hall sewage farm for the year 1914 shows a profit of £65. The result would have been more satisfactory, but for the fact that five bullocks, valued at £140, had died.

Teddington U.D.C. The Sanitary Committee on Monday recommended the acceptance, at £22,298, of the tender of Messrs. J. J. Mann & Co. for the sludge filters for the sewage disposal works. It was agreed, however, to refer the three lowest tenders to Mr. Fairley, the engineer to the scheme, for report, as it was possible he might suggest modifications which would effect a saving of £3,500. It was further agreed to pay Mr. Fairley a fee of £100 if his suggestions were not adopted, or £250 if they were.

WATER, GAS, AND ELECTRICITY.

Ballinrobe U.D.C. The council have prepared a scheme for an improved water supply to the town estimated to cost £5,000.

Bethnal Green B.C.—The Electricity Committee have submitted an estimate of £15,944 for the supplying and laying of cables and execution of road work in connection with the new electricity undertaking. The council do not intend to generate their own electricity, but will obtain the supply they require from the Stepney Borough Council. In connection with the contract for cables and accessories, the Electricity Committee propose to stipulate that these shall be manufactured by British firms.

Bourne U.D.C.—The council have obtained a loan for the purchase of the gas-works—viz., £275 for ten years, £600 for sixty years, and £13,355 for thirty years—all at 4½ per cent. to be repaid in equal half-yearly instalments of principal and interest.

Cardiff T.C.—The Waterworks Committee have resolved to send a circular letter to architects, builders and contractors, stating that on and after March 1st next all water fittings and appliances must be submitted to the corporation for testing, excepting those bearing the registered trade mark. This action is taken, it is said, in the interests of [illegible] of the fittings used within the area of the corporation. The testing fees will vary from 1d. for taps to 4d. for cisterns.

Exeter T.C.—The Water Committee have decided, on the report of the city engineer, Mr. T. Moulding, to recommend the duplication of the machinery extension of the filtering beds at Pynes waterworks. They say that the matter will admit of no further delay. The Earl of Iddesleigh has offered to present to the council the land required for the two new filter beds, subject to the council undertaking certain slight services, and the thanks of the committee have been presented to his lordship for his liberality. The committee recommend that application should be made to the Local Government Board to sanction the borrowing of £8,824 for the duplication of the machinery and other extensions of the waterworks.

Teddington U.D.C.—The Sanitary Committee, in their report upon the electric lighting tenders, recommended that one 100 horse-power [illegible] be accepted, and that the tenders of Messrs. [illegible] Queen Victoria-street, Westminster, be accepted, the price being £545 or £556, according to the type of oil engine. As to this point, the matter was left to the engineer, Mr. [illegible].

MISCELLANEOUS.

Hull T.C. It was stated at a meeting of the Water Committee last week that, under the agreement with the corporation, a water supply for Withernsea will be available by the end of June next. For the purpose of that supply to Withernsea, and the rural district between Withernsea and Hull, a water tower and reservoir will have to be constructed. The committee sanctioned the purchase of a site at the rate of 70 per [illegible].

Paddington B.C. In order to provide work for the unemployed, the council have formulated a scheme for rearranging disordered memorial stones and levelling disturbed ground in the Paddington Cemetery. The work will cost £324.

PERSONAL.

Mr. F. G. McHugh, Municipal Buildings, Norwich, has been elected a member of the Royal Sanitary Institute.

Mr. James G. Melvin, B.SC., of Maryhill, Glasgow, has been appointed assistant burgh surveyor of Helensburgh.

Mr. R. O. Roberts, of Langport, Somerset, has been appointed surveyor to the Pontypool Rural District Council at a salary of £100 a year.

Mr. H. H. Oakes, surveyor to the Ventnor Urban District Council, has been appointed clerk to the council *pro tem.* in the absence of Mr. W. Tozer on military service.

Mr. J. H. Lowndes, of Scunthorpe, has been appointed mechanical engineering assistant in the Norwich city engineer's department, at a commencing salary of £150 per annum.

Mr. Walter V. Anderson, the city engineer and surveyor of Winchester, had the honour of being presented to the King on the occasion of His Majesty's visit to that town last week.

Mr. B. Ball, municipal engineer's office, Singapore, who has been transferred from the class of associate-member to that of member of the Institution of Civil Engineers, is at present in England on leave.

Mr. Donald McColl, superintendent of the Glasgow Corporation cleansing department, was last week presented by his colleagues with a silver rose-bowl with flower vases upon his retirement after forty-six years' service.

Mr. G. L. Butterworth, who, as announced in our issue of last week, has been elected an associate-member of the Institution of Civil Engineers, is the engineer and surveyor to the Isle of Thanet Rural District Council.

Mr. H. A. Hosking, surveyor to St. Germans Rural District Council and Mr. W. Olver, surveyor to

Newton Abbot Urban District Council, have been appointed assistant county surveyors to the Cornwall County Council. The appointments are made in connection with the county taking over direct control of the roads in East Cornwall.

Mr. Jeremiah Wolstenholme, ASSOC.M.INST.C.E., ex-borough engineer and surveyor of Blackpool, died, we regret to state, last week, at the age of sixty-one. He was appointed to the Blackpool position in 1885, and resigned in 1900, and was responsible for many important municipal schemes, including the North Shore parade, the South Shore drainage, the electricity works and tramway depot.

Mr. A. E. Brookes, late county surveyor of Cornwall, who was recently appointed county surveyor of Durham, has been the recipient of a pleasing souvenir from the members of the Main Roads Committee of the Cornwall County Council. The chairman, Mr. A. Carbeck, at the meeting on the 13th inst., stated that the members contributed towards a gift to show their appreciation of the services rendered by Mr. Brookes, and how much they valued him and his loyalty to them. They had hoped to have Mr. Brookes with them that day, but as he was not he would send the gift—a case of cutlery—together with an expression of their feelings towards him.

FOR OTHER ADVERTISEMENTS
See End of Paper.

GOOLE URBAN DISTRICT COUNCIL.
SURVEYOR'S ASSISTANT.

Applications are invited for the appointment of Assistant in the Engineer and Surveyor's Department.

Applicants must be good draughtsmen, with a good knowledge of Surveying, Levelling, Building and Drainage Inspection, and the general work of a Surveyor's Office. Salary at the rate of £75 per annum.

Applications, in candidate's own handwriting, endorsed "Surveyor's Assistant," stating age and experience, accompanied by copies of not more than three recent testimonials, and giving the date on which the applicant can take up his duties, must be received by me not later than Monday, the 1st February, 1915.

J. H. CASTLE,
Engineer and Surveyor.

Council Offices,
Goole.
January 19, 1915. (2,285)

BOROUGH OF CHEPPING WYCOMBE.

The Corporation invites applications for the post of Temporary Clerk to fill the place of one on Military Service.

Preference will be given to those who have a knowledge of Municipal Accounts. Salary, 30s. per week.

Applications, stating age, experience, &c., accompanied by copies of three testimonials of recent date, must be delivered to my office by February 3, 1915.

Canvassing will be considered a disqualification.

T. J. RUSHBROOKE,
Borough Engineer and Surveyor.

25 Easton-street,
High Wycombe. (2,280)

CITY AND COUNTY OF THE CITY OF EXETER.
ROAD FOREMAN.

The Council of Exeter invite applications for appointment as Road Foreman, at a salary of £150 per annum.

A statement of the duties and Form of Application can be obtained at my Office.

Applications, on the official Form, must be received at my Office on or before Friday, the 5th February, 1915.

Canvassing will disqualify.

H. LLOYD PARRY,
(2,282) Town Clerk.

COUNTY BOROUGH OF DEWSBURY.

Wanted, in the Borough Engineer's Office, a Temporary Engineering Assistant. Must be a good Draughtsman. Commencing salary at the rate of £100 per annum. Any further information may be obtained by applying to the Borough Engineer, Town Hall, Dewsbury. Applications, in envelopes marked "Engineering Assistant," must be in the hands of the Borough Engineer not later than 4th February, 1915. (2,286)

LANGPORT RURAL DISTRICT COUNCIL.
SURVEYOR'S ASSISTANT.

The Council invite applications from qualifying Engineers and Surveyors for the appointment of a Surveyor's Assistant. Salary at the rate of £75 per annum, payable monthly.

The person appointed will act under the supervision of the Surveyor, and perform such duties as he may require.

Applications, in candidate's own handwriting, stating age and qualifications, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than the first post of Monday, 25th instant.

(By order)
EDWD. Q. LOUCH,
Clerk to the Council.

Council Offices,
Langport, Somerset.
January 12, 1915. (2,281)

CITY AND COUNTY OF THE CITY OF EXETER.
CLERK OF WORKS.

The Council of Exeter invite applications for appointment as Clerk of Works, at a salary of £150 per annum.

A statement of the duties and Form of Application can be obtained at my Office.

Applications, on the official Form, must be received at my Office on or before Friday, the 5th February, 1915.

Canvassing will disqualify.

H. LLOYD PARRY,
(2,283) Town Clerk.

CITY AND COUNTY OF THE CITY OF EXETER.
CLEANSING SUPERINTENDENT.

The Council of Exeter invite applications for appointment as Cleansing Superintendent, at a salary of £120 per annum.

A statement of the duties and Form of Application can be obtained at my Office.

Applications, on the official Form, must be received at my Office on or before Friday, the 5th February, 1915.

Canvassing will disqualify.

H. LLOYD PARRY,
(2,284) Town Clerk.

URBAN DISTRICT OF PENGE.
TENDERS FOR SUPPLIES.

Notice is hereby given that after the expiration of 10 days from the date hereof the Urban District Council of Penge intend to enter into Contracts for the Supply of the following Goods and Materials; and that they are prepared to receive Tenders for the same, namely,—

Artificial Stone.
Brooms.
Disinfectants.
Drysaltery.
Flint, Sand, Gravel, and Ballast.
Tarred Granite.
Cement and Lime.
Granite Macadam and Chippings.
Winding, Regulating, &c., Clocks.

Forms of Tenders (which alone will be received), with full particulars of the various places of delivery, periods of Contracts, &c., may be obtained on application to the Surveyor, Town Hall, Anerley, S.E., on and after Tuesday, the 26th day of January, 1915.

Sealed Tenders, endorsed "Tender for ——," as the case may be, to be delivered to me, the undersigned, not later than 12 o'clock noon on Saturday, the 6th day of February, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

Dated this 21st day of January, 1915.

ARTHUR E. EVES,
Clerk to the Council.

Town Hall,
Anerley-road, Anerley, S.E. (2,287)

BUILDER'S MANAGER seeks situation. Good manager, estimating, quantities and draughtsman; life-long experience; good references.—S., 103 Belgrave-road, Birmingham. (2,287)

NEW COUNCIL SCHOOL AT TWICKENHAM.

At Twickenham recently the new Church [illegible] were formally declared open by Mr. W. A. Slade, J.P., the Chairman of the Education Committee, presided, and Mr. F. W. Pearce, the Chairman of the Council, in moving a vote of thanks to Mr. J. H. Bevan, the Chairman of the Education Committee, said that, as a general rule, in this district, they appointed a consulting architect, leaving their professional friend nothing but praise for the way he attended to the building and [illegible] to finish.

The new building has been designed to accommodate 420 boys on the first floor and 420 girls on the ground floor, and, together with the building for the infants erected in 1911 on the same site, will provide places for 1,250 children. The accommodation consists of separate assembly halls for boys and girls, each 30 ft. by 28 ft. 6 in., sixteen class-rooms, teachers' rooms, cloak-rooms and lavatories for boys and girls, and basement for heating apparatus and coal and coke stores.

Special attention has been given to the question of lighting and ventilation. The class-rooms are placed so as to receive direct and ample lighting on the south side, carried to the full height of the rooms, and are so planned that in every case the desks are lighted from the left-hand side of the scholars. In addition to the window ventilation, special inlet and outlet ventilators are provided in each class-room, arranged so as to secure adequate ventilation at different levels above the breathing line, and ventilators fitted with regulating valves are also provided near the external walls for the supply of warm fresh air during the winter months. The assembly halls, corridors and cloak rooms are also provided with special extract flues connected with ventilating turrets in the roof, and the cloak-rooms are fitted with wrought-iron lattice folding gates, which not only serve as a protection against theft, but also materially assist the ventilation. The school is heated throughout by an accelerated low-pressure hot-water system, and is lighted throughout by electric light, the whole of the wiring being placed in steel tubes.

The building is faced externally with Adderley Park best pressed red facing bricks up to the level of the window sills, and picked stock facings for the remainder of the height, and the window mullions are constructed in red brick, with artificial stone keys. Artificial stone has also been used for the window sills, the dressings to the entrance doorways and windows, and for the coping of the parapet walls. The roofs are covered with Welsh green slates. Internally the walls are finished with plastolith dados up to a height of 5 ft. 6 in. and stippled plaster for the remainder of the height. The floors in the hall on the ground floor and the corridors throughout are of patch pine blocks, and the floors of the class-rooms, basement and latrines are finished in granolithic paving, the entrance halls being paved with terrazzo. All external angles in the brickwork, woodwork, and plaster are rounded in order to prevent unnecessary damage to the fabric, and to avoid risk of accident to the children.

The final accounts of the building have not yet been completed, but it is estimated that the total cost, including a moiety of the cost of fencing, boundary walls, latrines, playsheds, and drainage works previously carried out in connection with the erection of the infants' department, will be approximately £11,200, or £13 6s. 8d. per head of the accommodation. It may be pointed out that, while no unnecessary ornamental work has been introduced in the erection of the building, there has been no elimination of items which are necessary, either in order to secure efficiency and hygienic conditions, or which tend to reduce, so far as possible, the cost of future upkeep.

The contractor was Mr. W. Lacey (Hounslow), and the electric light installation was undertaken by Messrs. J. B. Marr & Co., the hot-water engineers being Messrs. Haden & Sons.

Sewage Works Machinery.—Neither the war, nor the recent rebellion appear to have had any serious effect on municipal activities in South Africa, for we learn that the Ames Crosta Sanitary Engineering Company, Limited, 12 Victoria-street, Nottingham, have just had their tender accepted, in open competition, for supplying and installing sludge elevating machinery, gas engine, &c., for the Municipality of Johannesburg.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President: Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor and Water Engineer, Cheltenham.

DONCASTER MEETING.

A North-Eastern District meeting is to be held at Doncaster on Saturday, January 30th.

PROGRAMME.

2.30 p.m. Meet at the Mansion House. Short paper, "Some Notes on Extraordinary Traffic," by Mr. F. Oscar Kirby, M.Sc., Assoc.M.Inst.C.E., borough engineer, Doncaster.

4.30 p.m.—Tea, by kind invitation of his Worship the Mayor (Mr. S. Balmforth).

5.30 p.m. Business meeting.

(1) Correspondence.

(2) Minutes of last meeting held in Sheffield, May 2, 1914.

(3) Election of Executive Committee.

(4) Any other business.

In order that the necessary arrangements may be made, members must give notice not later than Tuesday, January 26th, of their intention to be present.

L. F. Wakefield, M.Inst.C.E.,
Hon. District Secretary.

Wakefield.

MEETING IN METROPOLITAN DISTRICT.

A meeting of the institution will be held at 92 Victoria-street, Westminster, on February 5th.

PROGRAMME.

8 p.m.—Presentation to the late secretary, Mr. T. Cole.

8.15 p.m.—Paper by Mr. H. D. Searles-Wood, F.R.I.B.A., on "Building Bye-laws and a Court of Appeal" (which will be taken as read).

Discussion.

Adjourned discussion on paper by Mr. W. H. A. Court, on "By-laws and the Housing Question," presented at the meeting at Hinckley on October 3, 1914.

Those attending should intimate their intention to the secretary on or before Wednesday, February 3rd, so that arrangements can be made and copy of paper forwarded.

Norman Scorgie, M.Inst.C.E.,
Hon. District Secretary.

Hackney.

ANNUAL MEETING.

June 24th, 25th and 26th (subject to alteration).

Papers or communications are cordially invited for discussion at the annual meeting to be held in London this year. The following subjects are suggested, but others will be welcomed:—

(1) The improvement and maintenance of highways in connection with modern traffic conditions.

(2) The use of reinforced concrete in buildings, road construction, &c.

(3) Town planning.

(4) Haulage by mechanical means *v.* horse power from an economical point of view.

(5) Restriction and control of heavy traffic both as regards weight and speed.

(6) The maintenance and strengthening of iron and steel bridges.

J. W. Dudley Robinson,
Secretary.

92 Victoria-street, S.W.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Monday, February 1st, at the Institution of Electrical Engineers, Victoria Embankment, W.C. (south end of Savoy-street, near Waterloo Bridge), Mr. H. C. H. Shenton (president, 1914) will present the premiums awarded for papers published in the *Journal* during 1914.

Mr. Norman Scorgie, the president for 1915, will then deliver his presidential address.

The chair will be taken at 7.30 p.m. precisely.

A. S. E. Ackermann,
Secretary.

17 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. W. H. Matthews Jones, C.E., Engineer and Surveyor, Chester.

NO. 1 (NORTHERN) DISTRICT.

A meeting of the above district will be held at Hartlepool and West Hartlepool to-morrow (Saturday).

PROGRAMME.

1.15 p.m. Lunch at Central Grill, West Hartlepool (charge 2/- per head).

2.5 p.m. Leave Central Grill by tramcar for Central estate, Hartlepool; upon arrival, walk along Hartlepool Promenade past the Batteries and visit various parts of the town to inspect damage by recent bombardment.

3.30 p.m. Return to West Hartlepool and visit gas works, waterworks, and tram depots. If time permits inspect new swimming baths at Seaton.

4.45 p.m. Short business meeting in committee-room at municipal buildings.

JOHN ROBINSON,
Hon. Secretary.

Darlington.

Change of Address. Messrs. Mossay & Co., Limited, have removed from their premises at 45 Horseferry Road to Queen Anne's Chambers, Westminster, where they are continuing their engineering business. In announcing this the firm mention that they have made arrangements with Messrs. Ransomes, Sims & Jefferies, Limited, Orwell Works, Ipswich, for the manufacture of their (Messrs. Mossay's) design of electrically driven vehicles. Under these arrangements they are also acting as selling agents for these vehicles in the United Kingdom. A first series of chassis is already in hand.

WOKING.—February 22nd.—For the construction of three screening chambers and detritus tanks, three sedimentation tanks, fifteen circular bacteria beds, provided with automatic distributors, six humus tanks, various lengths of effluent carriers, engine-house, sludge pump and press-house, and engine-houses for driving screens and pumping humus, and other works, for the urban district council.—Mr. G. Midgley Taylor, Caxton House, Westminster, S.W.

Stores.

LEIGH.—January 25th.—For the supply of grit setts, kerbstones, channel stones, macadam, chippings, sewerage pipes, castings, pitch, and creosote oil, for the corporation.—Mr. Tom Hunter, borough engineer and surveyor, Town Hall, Leigh, Lancs.

NORTHAMPTON.—January 25th.—For the supply of broken granite, granite kerb, setts, artificial stone paving, stoneware pipes, gullies, Portland cement, lime, ironmongery, wrought iron, steel, tar-paving, tar-macadam, blue bricks, gravel, sand, brooms, brushes, coal, coke, iron castings, timber, and team labour, for the corporation.—Mr. Alfred Fidler, borough engineer.

WILLESDEN.—January 26th.—For the supply of paving, road material, tar paving, tar-macadam, and tar for use on roads, house rails, fences, etc., granite chippings, broken granite, stone, etc., for the urban district council.—Mr. C. Bolton, engineer and surveyor, Municipal Offices, Dyne-road, Kilburn, N.W.

CHISWICK.—January 27th.—For the supply of oils, motor spirit, drysaltery, ironmongery, disinfectants, alumino-ferric or copperas, lime, cement, Kentish pit flints, hoggin, blue Guernsey granite, and other broken road stone, York and other paving, tarred granite slag and limestone paving, tar, asphalt, pipes, gullies, sludge presses, and hire of horses and drivers, for the urban district council.—Mr. Edward Willis, surveyor, Town Hall.

OTLEY.—January 29th.—For the supply of granite, limestone, tar-macadam, slag dust, setts, kerb, flags, pitch, brushes, coal, and hauling stone, for the urban district council.—Mr. C. F. Hodgson, surveyor, Council Offices, Otley.

GRIMSBY.—January 29th.—For the supply of chalk, whinstone macadam, artificial flags, Yorkshire flags, Yorkshire kerbs, granite setts, granite kerbs and channel, pitch, coal-gas tar, Buxton quicklime, blue lias lime, dog-kennel lime, Portland cement, drainage pipes, brushes, drysalteries, oils, paints, disinfectant fluid, disinfectant powder, and formalin, for the corporation.—Mr. H. Gilbert Whyatt, borough engineer and surveyor.

FROME.—January 30th.—For the supply of scavenging brushes, Portland cement, broken limestone, broken granite, tarred material, tools, kerbing, channelling, pennant and concrete flagging, and coal, for the urban district council.—Mr. F. W. Jones, Public Offices, Frome.

WIGAN.—January 30th.—For the supply of [illegible] horse brush stocks and brushes, Portland cement, lime, common bricks, stoneware pipes, gullies, pitch, and creosote oil, manhole and gully grates, iron and tools, timber, oils and paints, glass and glazing, ironmongery, grit setts, kerbstones, channel stones, flags, gravel, chippings, and macadam, for the corporation.—Mr. A. T. Gooseman, borough engineer and surveyor.

CHELTENHAM.—January 30th.—For the supply of Portland cement, forage, stoneware pipes, broken stone, disinfectants, oils, colours, ironmongery (including tree guards), timber (including wheelbarrows and street orderly trucks), india-rubber goods, lead, brass fittings, tools for highways, wrought iron, steel files, electric lighting fittings, lias lime, and bricks, for the corporation.—Mr. J. S. Pickering, borough surveyor.

HUDDERSFIELD.—January 30th.—For the supply of granite setts, gritstone setts, granite macadam, furnace slag (broken and unbroken) for highway purposes, granite slag and limestone tar-macadam, flags, [illegible] kerbs, pitch and creosote oil, [illegible] materials, Portland cement, bricks, lime, and river sand, hay, straw and pot-ash, [illegible] brushes and brooms, earthenware pipes, [illegible] goods, house coal for highways department [illegible] (for all districts), shoeing horses, oils (engine, cylinder, gas engine, heavy bearing and petroleum), for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor, 1 Peel-street, Huddersfield.

OSSETT.—February 1st.—For the supply of materials, stores, and workmen's tools required in the highways, gas, lighting, water, sanitary and educational departments, for the corporation.—Borough Surveyor.

YORK.—February 1st.—For the supply of Portland cement, pitch and creosote oil, stoneware pipes, building lime, Yorkshire-stone flags, kerbing and edging, whinstone and limestone chippings, for the corporation.—Mr. F. W. Spurr, city engineer.

WOOLWICH.—February 10th.—For the supply of ballast, sand, brooms, brushes, cement, chandlery, drain pipes, forage, granite kerb, harness, ironmongery, road material, sewer ironwork, and timber, for the borough council.—Mr. J. Rush Dixon, borough engineer, Town Hall, Woolwich.

Miscellaneous.

SOWERBY.—January 27th.—For the supply and erection of filtration plant, for the proposed new baths.—Mr. James Eastwood, engineer and surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance
‡ Provisionally accepted.

BOLSOVER.—For the supply of Hartshill stone and chippings for the rural district council.
W. Iveson & Son, Normanton.*
Judkin, Limited, Normanton.*
G. Abell, Limited, Normanton.*
Jno. Hartshill, Normanton.
Mercaston Granite Company, Otherstone.
Mountsorrel Granite Company, Mountsorrel.*
Enderby and Stoney Stretton Granite Company, Leicester.
G. H. Gray & Company, Leicester.
W. Twigg & Company, Leicester.
Midland Granite Company.
Swithland Granite Company.
W. L. Tippetts & Company, Otherstone.
Castle Hill Granite Company, Markfield, Leicester.
Ratcliffe Stone Company, Stanton.
Charnwood Granite Company.

LEATHERHEAD.—Accepted for the erection of a sanatorium, for the corporation.—Mr. C. Brewerridge, borough engineer and surveyor.

A. Francis Nesten, £7,000.

DOVER.—Accepted for the collection and disposal of house refuse, for the corporation.—Mr. W. C. Hawke, borough engineer.

W. J. Kennett, Dover, £25.

HAPPISBURGH.—For carting work in Waxham-cum-Palle part of, for the urban district council.—Mr. John H. Leverton, surveyor:—
G. & E. Bell ... £ s.
W. Longwood ... 329
T. C. Jarvis ... 304
W. Brumpet ... 196
A. J. Pearson ... 140

Surveyor's estimate, £204.

LEEDS.—For building an administrative block at the small-pox hospital, for the corporation.—Mr. W. T. Lancashire, city engineer:—
W. Rogerson & Co., York-road, Leeds, £14,685.

MIDDLETON.—Accepted for the supply of about 1,400 tons of kerb & granite setts, for the corporation.—Mr. William Wesson, borough surveyor.
Penmaenmawr and Welsh Granite Company, Penmaenmawr.
Pwllheli Granite Company, Runcorn.
Brookes, Limited, Manchester.

ST. ANNES-ON-SEA.—For the construction of an open-air swimming bath, for the urban district council.—Mr. E. Harrison, architect, Accrington:—
E. Shepherd, Derwen ... £1,949
[illegible] & Sons, Preston ... 8,900
Martin Brothers, Rawtenstall ... 8,817

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

JANUARY.

27.—Institution of Mechanical Engineers.—Mr. John Dewrance on "Standardisation of Pipe Flanges and Flanged Fittings." 8 p.m.

28.—Institution of Municipal Engineers.—Northern District Meeting at Hartlepool and West Hartlepool.

28.—Institution of Civil Engineers.—Discussion of Mr. A. Langley Bell's paper, "The Lateral Pressure and Resistance of Clay, and the Supporting Power of Clay Foundations," paper to be read "Engineering Operations for the Prevention of Malaria," by Mr. P. Dudley Evans. 8 p.m.

29.—Institution of Municipal Engineers: Council Meeting, London.

30.—Institution of Municipal and County Engineers: North-Eastern District Meeting at Doncaster.

FEBRUARY.

1.—Society of Engineers.—Mr. Norman Scorgie, Borough Engineer of Hackney, delivers his Presidential Address; Presentation of Premiums. 7.30 p.m.

[illegible].—Institution of Municipal and County Engineers: Meeting at 32 Victoria-street, S.W., 8 p.m.

13.—Institution of Municipal Engineers: Northern District Annual Dinner, Newcastle-on-Tyne.

19-20.—Royal Sanitary Institute: Meeting at Manchester.

23.—County Councils Association: Annual Meeting. 3 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

HERTFORDSHIRE COUNTY COUNCIL.
Clerk of Works Wanted for large Softwood Paving Contract in Hertfordshire. Must have had experience in similar work, and be thoroughly acquainted with qualities of Timber. Salary £3 per week.

Applications, accompanied by testimonials, to be forwarded at once to the County Surveyor, Hatfield, Herts. (2,272)

CORPORATION OF LEICESTER.
SEWAGE WORKS SUPERINTENDENT.

The Sewage Works and Farms Committee of the Corporation of Leicester invite applications for the appointment of Superintendent of the Effluent and Sludge Pumping Station and Bacterial Works at their Beaumont Leys Sewage Farm, to act under the direction of the Borough Surveyor.

Applicants must be qualified practical mechanical engineers, and have had experience in the running and overhauling of high-speed engines and centrifugal pumps. It is essential that they should also have had experience in the running of electrical plant.

Candidates should state full particulars of their experience in the supervision of sewage disposal works.

The successful candidate must be a married man, and reside in the house which is provided on the farm.

Salary £3 per week, with house, rates, water and coal free.

Applications, stating age and present occupation, with copies of at least three recent testimonials, and endorsed "Sewage Works Superintendent," are to be addressed to the undersigned, and delivered at the Town Hall, Leicester, not later than Friday, January 29th, 1915.

E. GEORGE MAWBEY, M.INST.C.E.,
Borough Engineer and Surveyor.

Town Hall, Leicester.
January 18, 1915. (2,274)

CUDWORTH URBAN DISTRICT COUNCIL.
The above Council require the services of an Assistant in the Offices of their Surveyor and Sanitary Inspector.

Candidates must have been properly trained in the Office of a Municipal Engineer. Sanitary Inspector's Certificate desirable.

Salary £80 per annum.

Applications, in candidate's own handwriting, stating age and experience, accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than January 30, 1915, endorsed "Assistant."

W. T. LYNAM,
Surveyor and Inspector.

Council Offices,
Cudworth, near Barnsley. (2,268)

COUNTY BOROUGH OF BIRKENHEAD.
The Corporation of Birkenhead invite applications for the position of Engineering Assistant in the Borough Engineer and Surveyor's Department, at a salary of £120 per annum, rising by annual increments of £5 to £150 per annum.

Candidates must have had experience in a Municipal Engineer's Office, and be not less than 21 years, nor more than 35 years of age.

Preference will be given to candidates who have passed Studentship Examination of Institution of Civil Engineers, or similar examination.

Applications, in candidate's own handwriting, stating age and experience, and accompanied by copies of not more than three recent testimonials, sealed and endorsed "Assistant, Surveyor's Department," must be delivered at the Office of Mr. Chas. Brownridge, M.INST.C.E., Borough Engineer and Surveyor, Town Hall, Birkenhead, by 12 noon on Saturday, the 6th February, 1915.

Canvassing will be deemed a disqualification. (2,277)

NEWTON ABBOT RURAL DISTRICT COUNCIL.
The Council require the Services of a Highway Surveyor for the Southern Sub-district, which comprises 16 parishes, with about 40 miles of main roads and 210 miles of district roads.

The salary will be at the rate of £150 per annum, and will include all travelling and other expenses, except stationery and postages.

The appointment will be subject to the approval of the Main Roads Committee of the Devon County Council.

Candidates must have had not less than two years' experience as a Highway Surveyor, and the person appointed must devote his whole time to the duties, and give security in an approved guarantee society in the sum of £200 for the faithful discharge of his duties.

Application, in candidate's own handwriting, stating age and previous experience, with copies of not more than three testimonials of recent date, to be sent to me on or before 12 o'clock on Monday, the 1st day of February, 1915.

(By order)
FRED HORNER,
Clerk.

Council Offices,
Newton Abbot.
January 16, 1915. (2,275)

APPOINTMENTS WANTED.

ADVERTISER wishes negotiations with Manufacturers or Contractors desirous of introducing their Specialities or developing their Trade with Municipal Authorities, Home and Foreign Railways, Steamship Companies, Export Merchants, &c.

An influential connection and the advantages of own London Offices and Showroom placed at their disposal upon favourable terms.—Address Box M.866, c/o W. Dawson & Sons, Limited, 121 Cannon-street, E.C. (2,279)

TENDERS WANTED.

WILLESDEN DISTRICT COUNCIL.
ANNUAL CONTRACTS.

The Willesden District Council are prepared to receive Tenders from persons willing to enter into Annual Contracts, commencing April 1st, 1915, to Execute the following Works or to Supply the following Materials viz.:—

1. Jobbing Works in Construction of Sewers, &c.
2. Supply of Artificial Slab Paving.
3. Supply of Tar Paving and Execution of Tar-paving Works.
4. Supply of Horses, Carts and Drivers, for cartage of various descriptions.
5. Supply of Gravel, Flints, Burnt Ballast, &c., for repair of roads, &c.
6. Supply of Broken Granite for repair of roads, &c.
7. Supply of Lime, Cement, Salt-glazed Ware Pipes, &c.
8. Supply of Oils and Chandlery.
9. Supply of Coal and Coke.
10. Barging of Road Slop, &c., from Fermoy Wharf.
11. Supply of Horse Provender.
12. Supply of Ironmongery and Tools.
13. Supply of Timber.
14. Wood-paving Works.

Specifications and Forms of Tender may be obtained upon receipt of 5s. for each Tender Form, on and after Monday, January 18th, 1915, upon application to Mr. O. Claude Robson, M.INST.C.E., Engineer to the Council, Municipal Offices, Dyne-road, Kilburn, N.W. The deposit for Tender Form will be returned upon receipt of a *bonâ-fide* Tender.

Tenders to be delivered to the undersigned not later than 4 p.m. on Tuesday, January 26th, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
STANLEY W. BALL,
Clerk of the Council.

Municipal Offices,
Dyne-road, Kilburn, N.W.
January 12, 1915. (2,260)

METROPOLITAN BOROUGH OF WOOLWICH.

SUPPLY OF ROAD MATERIAL, FORAGE, STORES, &c.

The Council of the Metropolitan Borough of Woolwich are prepared to receive Tenders for the Supply of the under-mentioned Road Material, Forage, Stores, &c., from the 1st April, 1915, to 31st March, 1916:—

1. Ballast, Sand, &c.
2. Brooms, Brushes, &c.
3. Cement.
4. Chandlery.
5. Drain Pipes.
6. Forage (for six months from 1st April, 1915).
7. Granite Kerb.
8. Harness.
9. Ironmongery.
10. Road Material.
11. Sewer Ironwork.
12. Timber.

Forms of Tender, with Schedules and further particulars, can be obtained at the Office of Mr. J. Rush Dixon, M.INST.C.E., Borough Engineer, Town Hall, Woolwich.

The persons or firms tendering will be required to make a declaration that they have paid, and will pay, trades union rates of wages, and have observed, and will observe, trades union hours of labour upon all work carried out for the Council. The persons or firms whose Tenders are accepted will be required to enter into formal Contracts.

Samples may be inspected at the Town Hall, Woolwich, between 9 a.m. and 1 p.m., and 2 p.m. and 5 p.m. (Saturdays 9 a.m. to 1 p.m.). No Tender will be considered in cases where Samples are provided unless the tenderer or his agent has inspected them and signed the book to that effect. No Tender will be considered unless on the authorised Form of Tender.

Sealed Tenders, based on properly priced-out Schedules, must be delivered to me at the Town Hall, Woolwich, not later than 12 o'clock noon on Wednesday, the 10th February, 1915, in envelope endorsed "Tender for ——."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

ARTHUR B. BRYCESON,
Town Clerk.

Town Hall,
Woolwich.
January 19, 1915. (2,278)

TO STONE MERCHANTS, QUARRY OWNERS, PIPE MAKERS, AND OTHERS.

MARPLE URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the Supply of the following Material during the year ending March 31, 1916—viz.:—

1. Granite Macadam and Chippings.
2. Macclesfield Macadam and Chippings.
3. Limestone Macadam and Chippings.
4. Six-inch Setts.
5. Sanitary Pipes.

Specifications and Forms of Tender, together with any further information, may be obtained from Mr. D. J. Diver, the Council's Surveyor, Council Offices, Marple, to whom Samples must be forwarded.

Tenders, addressed to "The Chairman of the Council," to be delivered at the Council Offices, Marple, before 12 o'clock noon on Monday, the 22nd February next.

(By order)

J. W. RAMSBOTTOM,
Clerk to the Council.

Council Offices,
Marple.
January 19, 1915. (2,276)

Specify

Mexphalte and Fluxphalte for your 1915 road work.

These materials have increased in sales and reputation during the past season. There is no shortage of supplies or increase in prices. Mexphalte is unrivalled for grouting work and for asphalte macadam. Fluxphalte is a liquid bitumen for road spraying. Prompt deliveries from stock at competitive prices.

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. JANUARY 29, 1915. No. 1,202.

Municipal Engineering in 1914.

The appreciation with which our Special Annual Issue has been received in former years has induced us upon the present occasion to extend the limit which has by now become so familiar to our readers. Our annual review of municipal engineering work is therefore once again comprised in a series of articles, each of which has been specially written by an expert in the subject with which it deals, while this introduction will serve to point out some of the most salient features of the year's work. The reader of the articles which follow will at once observe that the far-reaching effects of the European war have extended into almost every branch of municipal engineering work. For example, the exigencies of military transport have caused earnest attention to be given to problems connected with the strengthening of roads and bridges, the trade upheaval has opened new markets for manufacturers of pumps and water mains; in the realm of architecture the international competition in connection with the proposed Australian Federal Parliament House has been postponed, and the search for improved methods of street lighting has been superseded in many places by the adoption of stringent regulations for street darkening. Many other instances of a similar kind might be cited, but in two directions at least the war has produced a stimulus to municipal enterprise. The first is that in many industrial centres the manufacture of ammunition, equipment, and various necessary supplies for the War Office and the Admiralty has resulted in a marked increase in the output of electricity for motive power, and the second that particularly in the metropolis, the commandeering of large numbers of motor-omnibuses for service at the Front has enabled the trams more successfully to meet their great competitor for public favour. Although the past year has not witnessed the appearance of any official publication on sewage disposal of such first-rate importance as the final report of the Royal Commission, the issue of the final and complete report of the Metropolitan Sewerage Commission of New York is worthy of note. The outstanding event of the year in the sphere of highway construction and maintenance was undoubtedly the Roads Congress held in connection with the annual meeting of the Institution of Municipal and County Engineers at Cheltenham, and our contributor on this subject reviews shortly the principal papers presented on that occasion. In the realm of practical experiment with materials some progress has been made, and the behaviour of the trial lengths of concrete road which have been laid in Kent on the main road from London to Dover will be watched with special interest. Each of the four sections is reinforced in a distinctive manner, and the result of the trial will afford a most useful comparison of the several systems. The next branch of municipal work which claims attention is that of water supply. And here there is an interesting tendency to note, inasmuch as the more general recognition of the efficiency of methods of purification is leading to a resumption of the practice of using the source of supply nearest at hand rather than incur the expense of the long pipe lines and other works necessary to procure a supply of exceptional purity from a distance. The science of water treatment is still in the stage of rapid development, but the period of absolute safety by the adoption of economical new methods has unquestionably arrived. Reference must here be made to the beneficial effects of water purification on the health of our armies both at home and in the field. The comparative immunity from the scourge of enteric is due to the fact that the authorities were able to procure at short notice plant capable of treating the worst water, and rendering it not only safe for drinking purposes, but of the best possible quality. In architectural and building work, chief activity has again been manifested in regard to the housing of the working classes, the largest scheme being that by which the Government propose to erect some eight thousand houses at Rosyth. Many public elementary schools have also been erected, the regulations of the Board of Education having been revised. Several large schemes for the provision of sanatoria and hospitals have been undertaken, the most notable being that by which it is proposed to construct a new infirmary at Bradford at a cost of £200,000. New guidance in the design of these institutions was afforded by the important memorandum on the subject issued by the Local Government Board. In the tramway world the work of the past year has once again demonstrated that there is as yet no justification for the suggestion that municipal trams are destined to be superseded by the self-contained motor vehicle. Even in the metropolis, where the conditions are unique, the severity of the competition of the motor omnibus is due in no small measure to the handicap of the statutory burdens imposed upon the tramways, while the excessive capital cost of the conduit system is another large factor in the situation. In provincial towns the profits have, in many cases, been remarkable, and considerable relief to the rates has resulted. The popularity of the railless trolley car has continued, extensions having been carried out in no fewer than five important towns, while new schemes have been adopted in other places. Apart from the restrictions which have latterly been imposed in regard to street lighting, the most remarkable event of the year in this department was the

appearance of the new half-watt lamp, which was put on the market in January. This is well adapted to replace the arc-light, and is already in use in many places. There are two points to be noted in regard to refuse disposal. One is the suggestion emanating from the Westminster City Council for a conference of all the metropolitan authorities to consider the advisability of taking some joint action in the matter; and the other is the increasing tendency to utilise the products of destruction for road-making, among the authorities who have installed machines for reducing clinker for this purpose being the corporations of Liverpool and Hornsey. In bridge construction further progress has been made in the use of reinforced concrete. Among the bridges for which this material has been used mention may be made of Wood Bridge at Guildford, and the new Longford canal bridge over the Bridgewater Canal, on the Chester main road at Stretford. The last matter which claims our attention is the supply of electricity. Here we find a rapid growth in the use of current for domestic purposes other than lighting—a particularly gratifying feature, inasmuch as it means an increased output for the same maximum load. The enormous scheme embodied in the bill being promoted by the London County Council bids fair to dominate the electrical situation for some time to come, and its progress will be watched with the keenest interest. Such, then, are the main features of the work of the most remarkable year in living memory. No one can tell what is hidden in the womb of the future, but municipal engineers as a body remain determined to discharge whatever duties may fall to their lot in the interests both of their localities and the nation.

BRIDGES.

Events during the latter part of the past year have probably caused more thought to be given to the destruction of bridges than to their construction; but, although this country has happily up to the present largely escaped the destructive efforts of our enemies, the mere possibility of a German invasion makes the construction and maintenance of our bridges a matter of vital military and national importance. The widespread destruction of bridges in Belgium, France and Poland is bound to make great demands in the near future on the energy and skill of the engineers of these countries, and it is very probable that not only will English money be required to build them, but that English engineers may be called upon to design, and English contractors to construct, many of the bridges destroyed or damaged on the Continent. Apart from the war and the possibility of having to transport heavy ordnance and other war material along our roads, the increasing number and weight of heavy commercial motors now using our roads and bridges makes the strengthening or improving of existing bridges a necessity in nearly all parts of the country. The increased number of vehicles now using our roads has also led to the widening of many existing bridges, and while in a number of cases it has been found possible to widen an existing bridge, it is generally found to be more expedient and economical to construct new bridges of much greater width and strength. The question of the materials to be used for the construction of the bridge is still largely governed by the span, though the weight of the loads to be carried, and the site and cost of materials, are all important factors in deciding this question. Timber, though still largely used in the Colonies and other countries where it is plentiful and other suitable materials are scarce, is rarely used in this country for highway purposes, and is chiefly used for footbridges, or road bridges of a temporary character. Among the timber bridges of a temporary character may be mentioned the footbridge at the Old Southwark Bridge, and those used for military purposes, such as the bridge across the Scheldt, which enabled our Naval Brigade to escape from Antwerp. The ease of transportation, quickness of construction, and the general availability of local supplies, make timber especially useful, whether the roadway of the bridge is laid on pontoons, barrels, or boats, or constructed on piles or trestles.

Masonry and concrete are still the most largely used materials for highway bridges, but in many of the highway bridges designed by our railway engineers brick and steel are still in great favour. Brick arches are very useful for short spans and where the depth of material in the bridge is not of great importance. For spans over 100 ft. masonry concrete, or steel are more reliable and economical. While reinforced concrete may be used for spans between 300 ft. and 100 ft., it has not, up to the present, been found advisable to use those materials for greater spans. The longest existing bridge in these materials is the reinforced concrete bridge at Langweis, Switzerland, with a span roughly of 330 ft.; but the Americans, as usual, are going to "lick creation" with a span of 703 ft. in the proposed Spuyten-Duyvil Creek Bridge at New York. For the largest spans steel is still without a competitor; and while simple trusses can be used up to 700 ft., it is more economical and advisable to adopt the cantilever principle for spans above this length. The cantilever system has generally been adopted for the largest span bridges, such as the Forth Bridge and the new Quebec Bridge over the St. Lawrence River. The site of the bridge cannot always be fixed from purely engineering considerations, as the saving of time and haulage by giving a more direct route may frequently lead to the selection of a more expensive site. Physical considerations again largely influence the design, such as the difficulty of obtaining satisfactory foundations, the avoidance of steep approach roads, the area of the waterway required for floods, and the headway necessary in the case of navigable rivers or canals.

For spans up to 300 ft., which may be said to meet the majority of the cases the municipal engineer has to deal with, there is a growing tendency to prefer reinforced concrete to masonry or steel. The saving in first cost over stone, and the saving in maintenance over steel, accounts for the selection of concrete in most cases; but the flatter arches that can be adopted, and in the case of small spans of the beam and slab type the absence of steep gradients in the bridge approaches, and consequent saving in embankments, make concrete not only convenient and economical, but also a growing and formidable competitor of stone.

BRIDGE ARCHES.

Stone, however, is still preferred by many engineers, and for nearly all the more important bridges of a monumental character stone is the material used for the arches, spandrils and balustrades, though concrete is generally used for backing to arches, spandrils, piers and abutments.

The objection to concrete for facing is its want of colour and texture, and the unsightly surface cracks which appear to develop in nearly all concrete structures. Added to this drabness and disagreement is the fact that neither architects nor engineers have yet solved the problem of treating this material in an artistic or pleasing manner. This is especially so in the case of the majority of bridges where reinforced concrete has been used, for many of them are so bald and ugly that they have brought the materials into great disfavour with many engineers and architects.

It is not too much to say that the average reinforced concrete bridge has, up to the present, been designed on such strictly utilitarian and economical lines that its bareness and want of enrichment in the shape of architectural mouldings has prevented those engineers and architects who still prefer taste to economy from adopting it in their bridges and buildings.

A case in point may be quoted in the widening of a bridge on the borders of the counties of Derby and Stafford, where a scheme for a ferro-concrete bridge, at a cost of £2,000 was abandoned in favour of a stone bridge to cost £5,000 mainly on account of the desire to preserve the artistic character of the old bridge.

Reinforced concrete can never have the massive grandeur of stone, for the lines on which it can be used economically do not permit of the boldness or depth of mouldings to be obtained in stone. It is probable that stone will always be preferred for monumental bridges, but there is abundant evidence that both engineers and architects, while more fully recognising the limitations of reinforced concrete, are beginning to develop more suitable methods of treatment, and are designing on more artistic and pleasing lines. Closely connected with this question of design and the aesthetic treatment of bridges is the question of who shall be responsible for the design of our bridges—the engineer or the architect.

The architectural profession claim that no structure of an ornamental character should be left in their hands, or, at any rate, should always be designed by an architect. Whenever a bridge has been successfully designed by an engineer in the past it has been amusing to see him claimed as an 'architect, as is the case with Rennie, the engineer of London Bridge. This bridge is admittedly one of the most satisfactory bridges from an artistic point of view in this or any other country. On the other hand, we do not find engineers claiming Wren as an engineer because he tackled successfully many engineering problems, including town planning and road design.

It is true that in France the engineer and architect frequently collaborate in the design of bridges, and occasionally, as in the case of the Pont Alexandre III. at Paris, with success; but opposed to this we find that the architectural press of this country is agreed that the attempt to give architectural expression to the Tower Bridge by allowing an architect to clothe Sir John Wolfe Barry's engineering design is not a success. The designs for giving an architectural character to the proposed St. Paul's Bridge, submitted in the competition held for this purpose in May last, cannot be said greatly to support the plea for handing over the design of our bridges to the architectural profession. In the first premiated design by Mr. G. Washington Browne, R.S.A., there is nothing of an architectural character in the bridge itself which the engineers, Messrs. Basil Mott & F. Sumner, could not have been expected to design equally satisfactorily. The principal features of Mr. Browne's design are the pylons and staircase at the south end of the bridge, and these chiefly owe their artistic character to the statuary to be placed in the centre of the stairway. The obelisks at the head and foot of the stairway are dwarfed by the pylons, and are unsatisfactory in scale and character.

The trouble appears to be that both the engineer and architect have the defects of their virtues, and while the engineer is generally too practical and restrained in his design, the architect goes to the other extreme and overloads his design with too elaborate, and frequently unmeaning, ornament.

In connection with this bridge it is interesting again to notice the different opinions with regard to covering the footways. Sir Aston Webb, in discussing a design by Mr. T. Raffles Davison for the proposed new bridge across the Thames at Charing Cross, said "he was disappointed that it did not show covered ways to the bridge. It was brutal to expect people to cross uncovered bridges on a pouring wet day. Southwark, St. Paul's, and Lambeth Bridges were all about to be built, and if we did not get protection on these bridges we should never get it at all." On the other hand, Sir Wm. Emerson, another past-president of the Royal Institute of British Architects, who was the assessor in the St. Paul's Bridge competition, may be said to disagree with this view, seeing that he awarded the first design to a scheme showing footways without covering. The covered footways certainly give the design less restraint and dignity, but their utility would be unquestionable. It is difficult to reconcile the objections of many architects to these features with their obvious penchant for ornament in the way of pylons and obelisks, which, whatever use they may have in some cases as giving weight to the abutments of bridges, are in the main, if not altogether, in the architectural mind introduced as an artistic or monumental feature. The chief fear in the minds of many people is that the covered footway may lead to the introduction of shops on our bridges like those on Old London Bridge, and so interfere with the view of the Thames or other rivers. There does not seem to be any great weight in the objection to covered footways, for the height required for headroom need not be so much greater that it would interfere with the view or be out of scale with the bridge or river. By keeping the cornice somewhat higher the artistic value need not be diminished, and in many cases the greater depth from the cornice to the crown would not only be an advantage structurally, but artistically. The simple fact remains that the bridges which are most admired are those in which the simplicity and severity of classical architecture is adopted, and in which the lines and design closely follow the structural necessities.

With the introduction of the covered footways on the bridge, we may soon follow with the covered footway or verandah on all our main streets, as foreshadowed by Bellamy in his "Looking Backward"; or as seen in colonnades such as the Rue de Rivoli in Paris, or the "Rows" in Chester.

BRIDGES AT BIRMINGHAM.

A paper on "Recent Highway Bridges in Birmingham," read by Mr. A. S. Parsons, ASSOC.M. INST.C.E., at a meeting of the Institution of Municipal and County Engineers, and reported in THE SURVEYOR of May 29, 1914, described four bridges which had been recently constructed in that city. The first bridge replaced a structure erected in 1842 which spanned both the river Rea and the Birmingham and Warwick Canal. The old bridge was composed of three brick arches, two each of 28-ft. span and one of 32 ft., with a width of roadway of 15 ft. between parapets. The new bridge has two spans of 41 ft. and 39 ft., the width of the roadway between the parapets being 42 ft. The brick parapets are carried on built-up steel girders, and two main girders are placed near the kerb to carry the trough flooring for the carriageway. This is a well-known type of bridge, and the most interesting features are the provision made under the footways for carrying the gas and water mains and the electrical cables, and the use of cover plates in the road troughing, which saves a large amount of concrete filling—estimated at 68 per cent of the total weight of flooring—and consequently reduces the stress in the main girders, and makes a corresponding saving in the weight of the girders also.

The description of the reconstruction of a brick arched bridge over the canal at King's road gives many useful details of construction and of the difficulties met with in bridge reconstruction,

which, owing to traffic necessities, is carried out in a very limited time. The gradient of the approach roads on the north side of the bridge averages 1 in 17, and the maximum gradient is 1 in 12·5, and this appears to be a case where the use of a reinforced concrete bridge could have been adopted with advantage. Although no details are given of the length of the approach road, it is probable that the greater depth required by the brick arches might have been saved by the use of reinforced concrete, and so have led to an improvement in the gradients of the approaches to the bridge.

Two other brick arch double-span bridges over the river Cole are described, and, besides giving very useful plans, sections and notes with regard to the methods adopted during the construction, the paper contains much valuable information regarding materials and the cost of construction, the methods of design, calculation of stresses and pressures, and the setting out of the work.

A MIDDLESEX BRIDGE.

A somewhat similar type of bridge to those at Birmingham is the bridge described in our issue of October 2, 1914. This carries the main Bath road over the river Crane in the county of Middlesex, and was designed by the county engineer, Mr. H. T. Wakelam, M.INST.C.E. The old three-arched bridge, with a width of 21 ft., which was built about 1780, is to be replaced by a two-arched bridge with a width between parapets of 50 ft The awkward lines of the road are to be improved, and the gradients of the approaches made 1 in 45. The arches have 26 ft. clear span, and are formed by four half-brick rings of blue brick, with 8 to 1 concrete filling over the arches and piers, and the piers and spandrels have stone dressings with a stone balustrade parapet.

PENWORTHAM BRIDGE.

A very much needed improvement is now being carried out by the Lancashire County Council from the designs of the county bridgemaster, Mr. W. Compton Hall, M.INST.C.E., by the construction of a new bridge over the river Ribble near the old Penwortham bridge at Preston. The old bridge had become unfit to carry modern traffic, was very narrow, made an awkward and dangerous angle on the main road from Preston to Liverpool, and the approaches were very steep. The new bridge gives a direct route from the town to the Liverpool main road, shortening the distance by over ½ mile, has easy approaches, and has only three spans instead of the five spans on the old bridge. The bridge is built in masonry, the three arches each have 90-ft. span, and the width between the parapets is 60 ft. The estimated cost of the bridge is £38,000, and it will be completed in the course of a few weeks.

REINFORCED CONCRETE BRIDGES.

Wood Bridge, Guildford.—The reinforced concrete bridge which, under the direction of Mr. A. Dryland, ASSOC.M.INST.C.E., the county surveyor of Surrey, was erected at Guildford in the place of a masonry bridge which had become inadequate for the traffic, was briefly referred to in our last Annual Issue, but a fuller description, with detail drawings of the bridge, was given in THE SURVEYOR of June, 1914. The clear span between the abutments is 70 ft., with a width of 40 ft. between the parapets. The bridge was designed to carry a test load of three 20-ton traction engines in train travelling over the bridge, in addition to the dead load. The train was placed in a position which caused a maximum bending moment on the span, and a uniformly distributed load was calculated which would produce an equal bending moment. This uniform load worked out at 200 lb. per square foot, which is the load per square foot for main road bridges recommended by various authorities on arched-bridge design. When tested with a deflectometer, the deflection was practically unmeasurable, being only $\frac{1}{32}$ in., or $\frac{1}{1008}$ part of the span, although the deflection allowed under the specification was $\frac{1}{1000}$ part of the span, or 1·4 in. The bridge is constructed with arch ribs at 5-ft. centres supporting the decking slab, one rib under each parapet, and two ribs being placed close together in the centre, allowing one-half of the bridge to be constructed at a time, and so avoiding the necessity of diverting the traffic. In order to provide satisfactory foundations for the abutments it was necessary to pile the ground with 12-in. by 12-in. "Kahn" piles, 22 ft. long, six to each buttress. Where the old foundations interfered with the driving of the piles a thick, heavily reinforced slab was put in between the rib buttresses over the existing foundations. The fronts of the buttresses are connected by a reinforced concrete wall, which forms a retaining wall for the earth filling over the abutments.

Longford Canal Bridge.—The new Longford canal bridge over the Bridgewater Canal, on the Chester main road at Stretford, is a reinforced concrete structure which replaces an old stone bridge dating from the time of the construction of the Bridgewater Canal. The old bridge, which had been twice widened to accommodate the increased traffic, was of a "bottle-neck" character, which had caused many accidents, and by making the new bridge the full width of Chester-road a much-needed improvement has been carried out. Whereas it was necessary on the old bridge to have interlacing tramway lines, the new bridge has a double track, and provides a greater space for the very heavy traffic of the district. The new structure is of reinforced concrete on the British Reinforced Concrete Engineering Company's system, with ashlar parapets and piers. It was constructed in two halves, so as not to interfere with the tramway and other traffic passing over the bridge. The width of the new bridge is 50 ft., with a carriageway of 35 ft., and two footpaths each 7 ft. 6 in. wide. The span on the skew is 36 ft. 9 in., covering a square span over the canal and towing-path of 34 ft. The roadway has been widened 16 ft. and the canal 10 ft., and the cost of the work is about £3,500.

Pont Ebbw Bridge.—A new ferro-concrete bridge, which replaced an old masonry bridge over the river Ebbw, some 2½ miles from Newport on the main road to Cardiff, is described in THE SURVEYOR of August 21st. The old bridge was very narrow, being only 18 ft. 3 in. between the parapets, with very awkward turnings at each end of the bridge.

By abolishing the bends at the ends of the bridge and widening it between the parapets to 40ft., the new bridge gives greatly improved traffic facilities.

The design of the new bridge follows very closely that of the old bridge, and has three spans, the two end spans being each 32 ft. 9 in., and the centre span 38 ft. 6 in. The old masonry abutments and piers are utilised for a portion of the bridge, the new portion being carried by ordinary concrete abutments and river piers. All three arches are of the monolithic type, securely fixed at the springings, and enclosing the old brick arches. The arches are 12 in. thick at the springing and 6 in. thick at the crown, and earth filling is deposited on the arches to the level of the roadway. The spandrel walls and parapets are in ferro-concrete.

Longtown Bridge, Cumberland.—A fully illustrated description will be found in our issue of October 16, 1914, of a new ferro-concrete bridge at Longtown, which is now being constructed to take the place of the interesting old cast-iron bridge built from the design of Thomas Telford in

1820, which had become unable to carry most of the traffic.

[illegible] designs, with estimates prepared by Mr. W. Scott Finch, the county surveyor, were submitted for masonry, steel girder, and ferro-concrete bridges, and as a result the latter materials design on the Hennebique system was adopted.

The bridge only 24 ft. wide between the parapet walls, is of considerable length, consisting of 3 three-arch spans with two short girder spans on the north approach. The central arch span is 105 ft. clear span, the two flanking spans being each 68 ft. 6 in. clear span, and the rise in the arch is about 8 ft. in each case. The bridge is of the three-arch rib type, with spandrel columns supporting longitudinal main beams, which in turn support the secondary beams and connecting decking, the whole being in monolithic connection. The abutments are L-shaped, and are constructed, consisting of vertical wall and flanking, each 3 ft. 6 in. thick, the shorter being 40 ft. and 45 ft. long, and connected to the vertical wall by three concrete counterforts, which take the thrust of the arch ribs. The middle counterfort is 5 ft. thick, and those on either side 4 ft. thick.

The full width of the abutment floors is 31 ft., the bearing area having been calculated for a pressure not exceeding 4 tons per square foot. The abutments are filled in with earth to the road level. The river piers have concrete foundations [illegible] resting on rock, 24 ft. wide and 40 ft. long in the direction of the stream. The [illegible] of the bases are maintained to a height of 3 ft. above the rock, and then taper to a pier width of 10 ft. The decking is 9 in. thick with a 9 in. depth of road material at the crown, and the balustrade is 4 in. thick.

It is an interesting piece of work, and, though of the usual severely plain type, its lines are such that it will not be inartistic or unsuitable for the situation in which it is constructed.

Warrington Bridge.—Among other reinforced concrete bridges which have been completed this year, the Warrington Bridge may be mentioned. The first half of the bridge was opened in July, 1913, to the long [illegible] was described in our last Annual Issue. The recent death of Mr. J. J. Webster, M.INST.C.E., the engineer for this and many other important bridges, may be noted.

Langweis Bridge.—A very interesting reinforced concrete viaduct, described in the April issue of *Concrete*, is being constructed near the village of Langweis, Switzerland. The viaduct carries an electric railway across the valley of Plessur and Sapenerbach, and has a main arch of 96 metres clear span between the abutments, or 100 metres span from centre to centre of springers, with a rise from the springer of 42 metres. On both sides of the main arch are a series of four smaller openings of 14·7 metres clear span. Three more spans beyond the abutments were afterwards added instead of an earth embankment as first proposed. The central arch comprises two separate arch rings, which are held together by means of rigid cross-beams. The width of the roadway between parapets is 4 metres.

Goombee Bridge.—A ferro-concrete arched bridge over the Goombee River at Lucknow was opened last year by the Viceroy of India, replacing an old bridge built in 1780. It consisted of five spans of 75 ft., the piers having 8 ft. centres. Each pier rests on three circular cylinders, carried down to the hard clay 33 ft. below the river bed. The width of the roadway is 22 ft., with 6-ft. footpaths on each side. The arches were originally to have been constructed in brickwork, but this was afterwards changed to reinforced concrete with seven concrete ribs to each span. The superstructure above the arches is in brick work, with red sandstone facings.

[illegible]

Of the large [illegible] bridges under construction or were opened this year, the new Quebec Bridge over the St. Lawrence River, the Lansdowne Bridge at Sukkur, the Scherzer Bridge over the Pamban Channel, between India and Ceylon, and the Manhattan and Hell Gate bridges at New York, may be mentioned.

Quebec Bridge.—The new Quebec Bridge, now in course of construction is of the cantilever type, and provides for four lines of railway and two footways, and has an extreme width [illegible] 2,590 ft. long between the faces of the abutments. The main span is to be 1,800 ft. between the centres of bearing, the anchor arms being 515 ft. long, the cantilever arms 580 ft. long, and the central suspended span will measure 640 ft. It has one approach span 140 ft. long at the south end, and [illegible] a land [illegible] 390 ft. long at the north end. The width of the bridge is 88 ft., and the [illegible] 150 ft. The type [illegible] is unsuitable [illegible] 4 [illegible] is [illegible]. It [illegible] minimum of advantages [illegible] bridge, especially during construction, the chief being that during erection of the cantilever span it is possible to complete each panel by itself and move the travelling [illegible] end of the completed portion. The bridge is to take on each track two [illegible] followed by a train load of 5,000 lb. per lineal foot of track. In addition to the actual dead weight of the structure, a load of 500 lb. per foot run was provided for on the suspended span, and of 800 lb. per foot run on the remainder of the bridge as an allowance for the winter snows. The bridge will [illegible] 87 tons per foot near the centre and [illegible] tons per foot near the piers, the corresponding [illegible] the Forth Bridge being 2 and 13½ tons.

Sara Ghat Bridge.—The bridge over the river [illegible] at Sara Ghat, about 120 miles above Calcutta, will carry the main line of the Eastern Bengal State Railway, and ranks as one of the most costly engineering schemes in India and the Far East. The estimated cost of the bridge and approaches is over £3,000,000. It is a double-line bridge capable of carrying the heaviest future loads, has a headway of 40 ft., and provides a public footway. The river has erodible banks, and at each abutment of the bridge are two guide [illegible] the first [illegible] are each 1,000 ft. long. The bridge has [illegible] each 1,315 ft., centre to centre of bearings, on piers spaced 359 ft. apart, and at each end [illegible] are three spans of 75 ft. The main girders are of the "N" type, with sub-panels, with a depth of 52 ft. at the centre. The width of the bridge, including the footway, is 48 ft. 6 in. The sixteen main piers are carried on wells sunk to a depth of 150 ft. to 160 ft. below lowest water-level, and are probably the deepest foundations of their kind in the world. It is hoped to complete the work and open the [illegible] during the present year.

Pamban Scherzer Bridge.—The Scherzer Bridge over the Pamban Channel, which has been completed this year, affords a means of communication between India and Ceylon. The viaduct from Pamban Point to Pamban is 6,776 ft. long, and a Scherzer bridge is constructed across the Pamban Channel, the channel being deep enough to allow of the passage of vessels of light draught. The viaduct has 145 openings of about 40-ft. span. The opening bridge is a double leaf through Scherzer rolling lift bridge, 225 ft. long and 16 ft. wide. At each end of the bridge is a fixed structure carried on steel cylinders. The leaves are raised and lowered by hand, but provision is made to work them electrically if required. The bridge was opened in February, 1914, and

reduces the length of the sea voyage from Colombo to Tuticorin from 150 to 22 miles.

Manhattan Bridge.—The Manhattan Bridge, connecting Manhattan Island and Greater New York, which is described at some length in the *Engineer* of September 25th and following issues, carries eight lines of railway track, two promenades, and a 35-ft. roadway, and is being completed at a cost of 25,000,000 dollars. It is 6,855 ft. long over all, including 2,505 ft. of steel approach viaducts, and is 2,920 ft. long between anchorages. The suspended spans are 725 ft., 1,470 ft., and 725 ft. respectively. They have a maximum clearance of 135 ft. above high-water, and are 120 ft. wide over all. They have four lines of stiffening trusses 24 ft. deep, suspended from cables 21½ in. in diameter and about 223 ft. long, supported on steel towers at a height of 315 ft. above high water. The eight railway tracks are at two different levels, one being over the other. This bridge has been constructed under several municipal administrations, and the dimensions and type of the structure have been from time to time radically modified. The system was originally designed as a wire cable structure, then changed to one with eyebar cables, and finally restored to the wire-cable system. Several engineers have been successively responsible for the work, and two well-known architects have been responsible for the architectural features of the substructure.

Hell Gate Bridge.—A bridge, which is said to be the largest steel arch bridge in the world, is being constructed at Hell Gate, over the East River in New York, between Long's Island and Ward's Island. It will form part of the New York Connecting Railroad, and carry four lines of railway. It is a two-hinged, framed arch structure of 1,017 ft. span between the towers at each end, 977½ ft. span centre to centre of hinges, and 280 ft. rise from hinges to crown of the lower chord. The roadway will consist of a reinforced concrete trough, filled with ballast, in which the sleepers will be embedded. The main stringers of the floor carry 8 in. transverse I beams, 15 in. apart, and between and on the top of these the reinforced concrete slab of the track trough is built. Each track will have its independent trough. Huge towers, built of reinforced concrete and faced with granite, are to be built at each end of the bridge, which not only give the essential stability to the bridge, and form ornamental portals and terminal, but will be used in erecting the structure.

OTHER STEEL BRIDGES.

Three other steel railway bridges now being completed, to which brief reference may be made, are the bridge over the Rio Chico, on the Mexican National Railway, the bridge at Riga, and the Great Western Railway bridge at Westbourne Terrace. The Rio Chico Bridge is a single-track cantilever bridge, having anchor arms of 105 ft., cantilever arms of 135 ft., and suspended span of 120 ft., with three-deck girder spans to the approaches, making a total length of 701 ft. 6 in. The Riga Bridge is 770 metres long, and has ten steel arches, the longest span being 90 metres. There is one opening spanned by a 40 metre bascule bridge, operated electrically. The new bridge at Westbourne Terrace has a span of 244 ft.

ELECTRICITY SUPPLY.

In spite of the cataclysmic convulsion which has distinguished the past year from all other years, the course of electricity supply in this country has not departed greatly from the normal. The year began with favourable prospects, and a number of interesting movements in process of development, and many of these have been duly advanced towards fruition. The supply of electricity is progressing apace, its applications are multiplying, and even a world-wide war cannot retard its development. The most serious effect of the war upon municipal supply stations perhaps has been the depletion of the staffs, many members of all grades having been called up to the Colours as Reservists or Territorials, and many more having volunteered for the new Army. But this movement has not been permitted to go too far, the importance of maintaining an adequate and reliable supply of electricity being fully realised. In many industrial centres the manufacture of ammunition, equipment, and various necessary supplies for the War Office and the Admiralty has resulted in a marked increase in the output of electricity for motive power, and the Government early took occasion to point out that those who assisted in carrying on these important functions were serving their country just as truly as those who joined the Army.

A minor effect of the war has been the cancelling of certain contracts for new plant which had been placed with German firms and obviously could not be carried out. This has, of course, resulted in the replacing of the orders with British manufacturers; but so many of the latter are engaged upon Government work of an urgent nature that some delay may be experienced in obtaining delivery. Fortunately, the time of heaviest load has been safely passed, and the need of additional plant will be less and less felt until next autumn. Many interesting revelations have occurred in connection with the true sources of certain raw or partly wrought materials used in the electrical industries, and the enforced suppression of some channels of supply has benefited British trade by compelling the development of home sources. It cannot be doubted that after the war the attitude of municipal committees towards the placing of important contracts abroad will be materially modified, and cheapness will cease to be the sole consideration by which they are guided.

DOMESTIC USES OF ELECTRICITY.

Broadly speaking, the most marked feature of the year appears to have been the rapid growth in popularity of electrical cooking and heating; the manufacturers of electric radiators cannot turn out apparatus fast enough to satisfy the demand. As it must be admitted that electric heating, except on a modest scale, is much more costly than heating with coal, and, though to a less extent, than with gas, it is obvious that the popular demand must be attributed to features which weigh more with the users than the cost of energy or fuel alone—namely, to the convenience and portability of the electric radiator, its freedom from fumes, its safety from fire, and so on. Great improvements have been effected in the construction of the apparatus, particularly in connection with the heating elements, which constitute the weak points of all such appliances, and some makers are now able to grant very extended unconditional guarantees, which indicate the confidence they repose in their products. The excellence of a design can only be correctly gauged by the popularity which it attains, and the present demand not only points the way to success, but also will facilitate the rapid trying-out of improvements in detail. The same applies to electric cooking apparatus, which, however, has less to fear from the competition of coal and gas, being well able to compete with the latter on level terms in almost any district where electrical energy is obtainable at not more than one penny per unit for domestic purposes—a condition which is fulfilled in a very large number of towns.

In his recent presidential address before the Institution of Electrical Engineers Sir John Snell stated that a great increase in the output of energy for domestic purposes other than lighting must be expected and provided for, the ratio of "other domestic units to lighting units in some cases which he had investigated being as high as ten to one—an extraordinary result. In his opinion a ratio of five to one would probably be attained in the near future, resulting in a greatly improved output and load factor, and consequently in decreased cost of production. Moreover, a most significant outcome of his exhaustive investigations was the discovery that the addition of heating and cooking to the lighting and power load made no difference to the maximum load upon a generating station. The full importance of this fact will perhaps be appreciated only by electrical engineers; but, briefly, it may be explained that the very large additional output thus foreshadowed could be provided without any additional capital outlay on plant and mains—and it is the heavy capital cost of electrical plant that necessitates a high price per unit for lighting and other loads which occur at the time of heaviest demand. Thus the cooking and heating loads are very welcome to the station manager, who can supply them at a very low price and still make a good profit. The reports of other engineers agree with the statements quoted above, and it was recently stated, for example, that even in such an unprogressive borough as Hackney a cold morning meant an extra load of 2,000 kilowatts, due to the use of electric radiators. In Marylebone, where special efforts have been made to promote the use of electricity for domestic purposes, it was reported some months ago that there were nearly 3,000 radiators, and no fewer than 1,000 electric cookers in use, as well as over 700 electric irons; in two years the heating and cooking connections had increased by 1,700 kilowatts.

THE HALF-WATT LAMP.

An important event in January was the introduction of a metallic-filament lamp of remarkable efficiency, giving two candle-power watts—a result previously unattained except by the most efficient arc lamps. Specimen lamps had been exhibited in London some months previously, but they now came on the market in quantity. As they could not be made for less than 1,000 watts (100 candle-power) at the customary pressure of supply, or 600 candle-power at 50 volts pressure, they were suitable only for illuminating streets or large halls and shops, thus competing with the arc lamp, and were inapplicable to ordinary indoor lighting. This was, however, a fortunate circumstance, for the sudden introduction of a lamp of so high an efficiency and suitable for domestic and similar purposes, would have had highly detrimental effects upon the business of electricity supply—much worse than those experienced when the tungsten lamp was first brought out—although, of course, in the long run the industry would benefit by it.

That the small lamps will eventually come can hardly be doubted, but it is to be hoped that the change will be gradual. The improved efficiency is due to the very high temperature of the filament—so high that the substance of the filament would evaporate too rapidly to permit of a long life if the lamp bulb were completely exhausted, as in the ordinary lamps. Nitrogen gas is therefore admitted into the bulb, at a pressure somewhat below that of the atmosphere, and by its presence checks the evaporation. At the same time, unfortunately, it cools the filament to some extent, and thus prevents the advantage of high temperature from being reaped to the full; but the reduction of consumption from 1¼ watts per candle to ½ watt is, nevertheless, an enormous stride; moreover, the convection currents in the gas carry the slight amount of tungstic oxide that is given off to the cooler upper parts of the bulb, where it is condensed, and thus the glass bulb remains untarnished throughout the life of the lamp, and the full initial candle-power is maintained. The guaranteed life of the ½-watt lamp is 1,000 hours, but in practice it is found that the average life is about 50 per cent. longer. The intense brilliancy of the filament, which is concentrated into a very small volume, renders it necessary to use diffusing globes, and consequently the new lamp was accompanied by a crop of special globes and reflectors; the concentration of the source of light facilitates the design of highly efficient reflectors and prismatic globes, and has led to a very marked improvement in these accessories. The special qualities of the lamp have also rendered it admirably adapted to the system of indirect lighting by reflection from the ceiling and walls, which has thus experienced a great increase in popularity.

[illegible]

The progress of the indirect [illegible] supply is well illustrated by the important projects which have been put in hand by several of the leading municipalities, including the London County Council. All these schemes are characterised by two essential features—recognition of the necessity [illegible] and the adoption of the system of generation and transmission at high pressure, employing three-phase currents, even though the general distribution is effected with direct current. Thus Glasgow, which had developed an enormous direct-current system with several large direct-current generating stations within the city, has found it necessary to commence a large [illegible] station at Dalmarnock, on the Clyde, which will cost half a million sterling; Manchester is preparing to erect a generating station of no less than 160,000 kilowatts capacity at Davyhulme, on the Ship Canal, which will cost £1,200,000; Liverpool is increasing the capacity [illegible] 30,000 kilowatts of three-phase plant—a station which formerly generated direct current; at Hull, where a high pressure direct-current system had been employed very successfully, the three-phase system [illegible] and Birmingham has important extensions in hand. Of these the most interesting is Manchester, as the new station, when completed, will be the largest in this country, and indeed will rank among the half-dozen largest steam-driven stations in the world; [illegible] undertaking. The city corporation supplies electricity to a population of three-quarters of a million, including many adjoining districts, and has at present plant of about 70,000 kilowatts, and 455 miles of mains. The last year's output was 117,000,000 Board of Trade units, and the receipts [illegible], the net supplies being slightly more than this figure. It is not surprising, therefore, that this undertaking led the way in installing generating sets of no less than 15,000 kilowatts each, and intends to use sets of 25,000 kilowatts in the new station. In London, the Metropolitan Borough Councils of Marylebone and Hackney, both of which commenced with direct current plant, have adopted three-phase for recent large extensions, and other examples could be given, showing the rapid development of the industry. Bethnal Green Metropolitan Borough Council has at last, after long years, decided to carry out an electricity supply scheme, and further progress has been made towards linking up the London municipal stations to help one another.

LONDON ELECTRICITY SUPPLY.

The question of the supply of electricity to London is a problem unique in the world, not only on account of the vast area and population served,

but also because of the extreme heterogeneity of the systems of supply at present in use. These compriso some fifty different varieties, in the hands of thirty-nine authorities, involving a capital investment of £21,000,000 sterling; but in "Greater London" there are over seventy systems and seventy authorities—and yet it is universally recognised that for economy, and consequently for cheapness of supply, concentration is essential. The question how to unify the diversity of systems and to substitute order for chaos, while at the same time satisfying the just claims of existing supply authorities, will be seen to be of immense complexity, and the situation is dominated by the fact that the London County Council has the right to purchase the property of the numerous companies supplying within its area in 1931.

In view of this consideration, which renders it absolutely necessary to decide upon the policy of the council before the approach of the purchase date throttles the expansion of the private undertakings, the council obtained an exhaustive report upon the situation from Messrs. Merz & McLellan, which was published in April. The authors recommended that steps should immediately be taken to initiate the gradual standardisation of supply throughout the area on the basis of three-phase transmission and distribution, and that the generating plant should be concentrated on sites down the river. They also advised that a special public authority should be formed by the county council to finance and control the whole undertaking, while the actual commercial management of the business should be confided to an operating body under the control of the former, the various existing organisations being gradually acquired and amalgamated on commercial terms. The scheme amounted practically to a system of co-operation between municipal government and private enterprise, embodying the advantages and avoiding the drawbacks of both, and a Bill on these lines was duly approved by the council for introduction into Parliament this year. The Bill provides for twenty-seven members on the authority, of whom eighteen will represent the county council and the remainder the various county and borough councils concerned. An expenditure of £10,000,000 sterling is contemplated during the next ten years, and provision is made to prevent existing authorised undertakers from extending their systems except with the approval of the authority, so as to ensure that all future extensions shall be available for incorporation in the unified system of supply which would ultimately obtain throughout the area—an area of 1,000 square miles. Opposition to the scheme is offered by many of the borough councils which possess their own undertakings, but whether this is due to irreconcilable hostility or merely to the desire to obtain the best possible terms remains to be demonstrated when the Bill is before the Parliamentary Committee.

The importance of the question to the dwellers in the metropolitan area can hardly be overestimated, and as the applications of electricity continue to multiply and expand it will increase. While leading with London it may be remarked that the county council, as loan authority for the [illegible] has evidenced a growing concern for the financial stability of their electrical undertakings, and has urged them to reduce the periods allowed for the repayment of their loans from sixty-two years to fifteen years or even less. This attitude is due to the rapid obsolescence of electrical generating plant since the introduction of the steam turbine on a large scale, whereby enormous quantities of plant driven by reciprocating engines—the best of their kind when installed, and in most cases still in first-class order—have been scrapped solely on account of age. Of this the most instructive example perhaps is the county council's own tramway generating station at Greenwich, where the huge engine-driven sets are being replaced by turbo-alternators. The advice of the county council has evoked strong protests from the borough councils, but there can be no doubt as to its wisdom; practice changes so quickly in electrical engineering, due to the continual progress in the science, that a loan of forty-two years' duration for generating plant is (and always was) an obvious absurdity. The Local Government Board never fell into this error.

Provincial Items.

Once more we have to note the increasing use of overhead wires for the supply of rural districts, where the cost of underground mains is prohibitive; not only private companies, but also very many local authorities, are adopting them, and it is clear that the popular prejudice against them is dying out. By no other means can the advantages of electricity supply be brought to the doors of residents in villages and small scattered townships.

While no large undertaking was launched during the year, in several instances transfers of powers took place between municipalities and companies, in both directions. A notable feature was the movement on the part of a number of gas companies to take up the supply of electricity—surely a significant sign of the times. The water-power plant started by Chester City Council last year has proved very successful, and a water-power scheme has been adopted by Knaresborough Urban District Council. Hove Corporation decided to purchase the local company's undertaking for £175,000.

The Ljungström steam turbine—a very remarkable invention—has been installed in several municipal stations during the year, the largest being one of 5,000 kilowatts at the St. Pancras Council's electricity works.

The lighting of small property at cheap rates is occupying more attention nowadays, and noteworthy results have been obtained at Wednesbury and Wimbledon, the principle being to supply a large block of cottages from one service, with the simplest wiring and fittings, and to charge a fixed sum per week per lamp. There is no doubt that a great deal can be done in this way to bring the electric light into the working-man's cottage, and to secure a substantial profit from this class of business. The system of charging ordinary consumers a fixed percentage on their assessment for rates, plus a charge of, say, ½d. per unit for energy consumed, continues to gain in popularity.

The question of tariffs was raised in an acute form during the year by Long Eaton Gas Company, which levied an action against the urban district council on the ground that the latter had infringed the statutory prohibition against preferential charges. The council had proposed to discriminate in favour of consumers who took both power and lighting from its mains, as compared with those who used electricity for power only, and this was shown to be a breach of the law, with the result that municipalities which had such tariffs in force found it necessary to revise them. Little, if anything, is gained by this militantly aggressive attitude towards the gas suppliers, and it is not a matter for regret that the illegality of the tariff has been demonstrated.

Proceedings of Societies.

An important event was the dissolution of the Industrial Committee of the Institution of Electrical Engineers by the council. Much had been hoped for from the committee's activity, and, in view of the council's decision, the Incorporated Municipal Electrical Association resolved to organise an influential body representative of all sections of the electrical industry to deal with matters of grave importance such as would have been handled by the committee. The Incorporated Municipal

Electrical Association for some time has been growing in influence and prestige, though not in membership, and this move, if successful, will further strengthen its position in relation to the electrical industry of this country.

In March the Incorporated Municipal Electrical Association published the draft of a Bill which it proposed to introduce into Parliament, for the purpose of conferring additional and very necessary powers upon municipal electricity suppliers. The contents in the main resembled those of previous Bills drawn up with the same object, but these had always been defeated by the opposition of the wiring contractors, who are bitterly opposed to the clauses which empower the municipalities to sell or hire out apparatus and to wire buildings. The new Bill was framed with a view to disarming this opposition by imposing restrictions on the competition feared by the contractors, and forbidding the suppliers to wire private property except through the agency of contractors. Without going into the details of the Bill, we may say that it offered a very fair compromise, which certainly ought to have been accepted by the contractors; but, unfortunately, they rejected the olive branch, and the matter will apparently have to be fought out as usual. However, the necessity of freeing the hands of the suppliers has become so pressing, and the terms proposed are so reasonable, that we think it likely that this time the municipalities will be successful. As a matter of fact, many authorities already possess some of the powers now sought for all, and there is no doubt that Parliament is not opposed to them on principle.

The Association of Electrical Station Engineers, which was formed in 1913, has rapidly gathered strength and influence, and was very active during the past year. It is composed of the junior members of station staffs, who are notoriously underpaid, and its objects are to improve their status and remuneration, without resorting to the methods of trade unions. At times, however, the association has shown symptoms of the influence of a considerable trade union element within its ranks, and its future proceedings will be watched by station managers not without concern. The possibilities of a strike of station staffs were fully demonstrated in Paris some years ago, and with the growth of electricity supply the matter is becoming increasingly important.

HIGHWAYS.

Though no International Road Congress was held during the past year, there were several smaller congresses, conferences, and meetings held at which many interesting papers on highway subjects were read and discussed. The most important of these was the Roads Congress held by the Institution of Municipal and County Engineers at their annual meeting at Cheltenham. The papers did not cover such a wide range of subjects as those at the International Congress, but they were, on the whole, more useful and practical. The discussions also were fuller and more interesting than those of the larger congress, at which so much time was spent in interpreting the speeches of the various delegates. At the London congress many of the delegates treated their subjects in a very academic manner, but as one would naturally expect, the papers and discussions at Cheltenham were eminently practical.

The next International Road Congress was to have been held in Munich this year, and an interesting programme had been drawn up. His Kaiser has, however, made other arrangements, and though many road engineers may still visit Munich this year, it is not as road experts. They, as victors in the existing war, may be interested that they hope to visit this interesting town.

Had it not also been for the interference of the war, much useful information would have been collected with regard to the classification of roads throughout the whole of the country. The abnormal state of affairs in which the country found itself involved last August rendered the census of traffic arranged to be taken during that month of little or no service, and though many surveyors had started to take the census, it was generally abandoned throughout the country. Classification is certainly necessary before the proposed Government grants can be distributed equitably, and as a preliminary to classification a census of traffic is not only desirable, but also a necessity. In connection with this classification of roads some important suggestions were made in a memorandum drawn up by the Highways Committee of the County Councils Association. Briefly, this recommended that all boroughs or urban districts with populations over 10,000 should be responsible for all first-class roads within their areas, and that all other first-class roads should be vested in the county councils as first-class county roads. Half the cost of maintenance should be paid by the Exchequer and half by the county councils.

All second class roads should be vested in the borough or urban district councils, except any second class roads which are main roads before the passing of the Act, of which the county councils were to be allowed to retain control. The cost of maintenance was to be borne in the following proportions: One-quarter by the Exchequer, one-quarter by the county council, and one-half by the borough or district council.

Third-class roads were to be widely controlled and maintained by the borough or district councils, except any third class roads which were main roads before the passing of the Act, when the control and maintenance would fall on the county council.

There can be no doubt that if these suggestions are adopted a great relief will be given to local burdens, and a great improvement may be looked for in the roads throughout the country.

The Fourth Annual Report of the Road Board, a short summary of which appeared in THE SURVEYOR, July 24, 1914, gives an interesting account of the work of the board in the various countries of the United Kingdom. The policy of the board with regard to grants and loans is clearly defined, and the allocation of the grants and loans to England and Wales, Scotland, and Ireland, is given in tables, which also show the nature of the improvements on which the grant or loan is to be spent. As is to be expected, the bulk of the money goes for the improvement and strengthening of road crusts, but road widenings, improvement of curves, gradients, and corners, diversion of roads, and reconstruction and improvement of bridges all receive the attention and assistance of the board. It is recognised by the board that more money is required for widening many of our main roads, but the greater need for making the existing roads fit to carry the increasing motor traffic compels the board to defer for a time assistance towards widening. The necessity of settling in advance the works intended for periods of trade depression, and that they should be works providing the maximum employment of labour, is also pointed out by the board.

HIGHWAY EXPERIMENTS.

Several interesting experiments in connection with highways have been carried out during the past year, the most important, perhaps, being those carried out by the Scottish district of the Institution of Municipal and County Engineers.

and those recently commenced by the county surveyor of Kent. While no highway engineer can afford to ignore laboratory experiments, the results of such experiments, put forward as they often are so dogmatically, are so frequently contrary to his practical experience, that he looks with a certain amount of scepticism on all such results. The important factors of weather, subsoil, and the wide range of loads and wheel diameters, which can hardly be reproduced artificially, have so great a bearing on the life of the road that most laboratory experiments fail to convince the road engineer of their utility, though they frequently excite his admiration by their ingenuity. In addition to this, the scientifically inclined mind is apt to regard as a great discovery certain actions or characteristics which are the common knowledge of most highway surveyors.

With regard to the experiments in the Scottish and Kent districts such objections cannot apply, as they are being carried out under the conditions of ordinary traffic, and are subject to all the climatic and traffic drawbacks of every-day life. In the Scottish trials, of which lengthy notes and extracts from a memorandum prepared by Messrs. J. Walker Smith and David Ronald are given in THE SURVEYOR of January 9, 1914, special care is being taken to put down the experimental lengths of road crusts in localities where the traffic is fairly comparable. Careful records are to be made of the physical and local conditions, the specification and record of methods of construction and materials, and factors tending to destroy the road, such as traffic and meteorological conditions. The records will include measurement of wear and observations of condition of surface, and the factor of cost, both initial and maintenance. The experimental lengths of roadway, eight in number, are chosen as far as possible with similar widths, gradients, soil, materials, and methods of construction and traffic; and on a continuous length without cross or junction roads, open and free from overhanging trees. The materials suggested are ordinary macadam, tar-painted macadam, and various forms of tar-macadam, though other forms of construction are not desired to be excluded so long as the cost does not exceed 2s. 6d. per square yard. Very careful specifications are drafted for each length, and full instructions are given with regard to the testing, traffic census, recording meteorological observations, wear, conditions of surface, and costs. The results of the experiments will be looked forward to with great interest, as they promise to be exceedingly valuable.

CONCRETE ROADS.

The experiments now being carried out by Mr. H. T. Chapman, the county surveyor of Kent (see THE SURVEYOR, November 27, 1914), will, in some respects, be even more interesting than the Scottish experiments, for, although concrete roads have been laid down for some years in America, they have only recently been laid in this country, and that only to a very small extent. The Road Board are contributing towards the cost of the four sections of road each 75 yds. long, which are to be laid on the London and Dover road between Gravesend and Strood. The concrete is to be 6 to 1, 6 in. thick, and reinforced by various forms of steel, and the British Portland Cement Manufacturers, Limited, are providing the cement, and several well-known makers of steel reinforcement the steel, free of cost.

Several reinforced concrete roads have been laid in this country, and some have been laid down sufficiently long to show that in many situations they will be successful. Concrete with a thin covering of bitumen, or as a foundation for wood paving, has, of course, been used for roads for very many years; but the new features are the use of reinforcement and the absence of a top coating. The surface of the concrete is either left sufficiently rough to give good foothold, or it is dressed with tar, or dressed with tar and a thin coat of limestone chippings.

It has been claimed for reinforced concrete roads that they can be constructed more cheaply than roads of ordinary macadam with pitched foundation, but this is hardly likely to be the case in many parts of the country, where macadam and pitching may be obtained close at hand. The chief advantage would seem to be the securing of a firm and durable roadway at a reasonable price, which in the case of peat or other weak subsoils could hardly be obtained otherwise without a great depth of materials, and consequently great expense. It would avoid potholes and inequalities of wear if made with first-class materials; but there are concretes and concretes, and with much of the material going under the name there would be trouble. The drawbacks to it are the greater difficulty and expense of cutting through the roadway for drainage or service pipes; the likelihood that the surface will either wear slippery or dusty; or that, in the case of tar painting and dressing with chippings, the surface will require constant renewal. Shock to horses travelling quickly on a hard road, and noise of hoofs, are also likely to be drawbacks.

Other troubles experienced with concrete roads in America have been the trouble from contraction and expansion, which a committee who inquired into this matter found was not due so much to changes of temperature as to changes in moisture condition. They found that concrete swells or shrinks every time it is wet or dried, just like a piece of timber, though, of course, not in the same degree. It was found that the maximum expansion occurs in April, when the road is thoroughly soaked by the winter's rain and snow, and when the temperature is somewhat greater than in winter. With the increase of temperature in summer it begins to shrink, and is shortest in August when thoroughly dry. This shows the importance of a rich, impervious mixture for concrete roadwork, so as to avoid absorption of water and consequent expansion as much as possible. A further recommendation of this committee is that the subgrade of the road on which the concrete is to be laid should be slightly dished, instead of being made flat or crowned. This tends to prevent longitudinal cracking of the road by making the centre thicker and stronger.

A further point dealt with by another committee was the finishing and curing of concrete surfaces. Even in many of our main streets paved with asphalt on a strong bed of concrete, depressions and pockets are to be found. As the concrete cannot have much crossfall without being dangerous, great care will be necessary to obtain an even surface with the proper fall. In the same way uniform and careful mixing of the materials are required to obtain a dense and even surface. An excess of large stones at one point, or an excess of mortar at another, will not wear uniformly, and cannot be made into a uniform surface. To avoid slipperiness, the surface is frequently roughed with a broom, or grooves have been cut in the concrete, especially where a fine and very hard material has been used for surfacing.

An equally important matter is the curing of the exposed surface of the concrete. Too rapid drying of the surface will give a somewhat soft surface, which will work up as dust. The essential thing is to keep the surface wet as long as possible. A mere sprinkling of the surface once a day in summer is not enough, and the surface should be continually watered in hot weather for fourteen days. A good method is to cover the concrete with a layer of sand or earth, and sprinkle it often enough to keep the surface in a moist condition. For the first twenty-four hours many engineers require the concrete to be covered with canvas.

Traffic should be kept off the road for about three weeks, and longer if possible in winter when the concrete sets slowly.

For strengthening road foundations wood-block paved or asphalt roads steel mattress would be likely to play a great part in the near future. The heavy motor trucks in many cases have made the ordinary foundations quite inadequate, and these, especially for cross-way tracks, may with great advantage and economy be reinforced with steel.

TAR MACADAM.

The use of tar-macadam is not only becoming certainly extended in the country, but also on the Continent, in America, India and the Colonies. The interest taken in all that relates to the successful use may be seen in the numerous articles and papers dealing with this subject to be found in our columns. The Scottish experiments are almost wholly confined to experiments with various forms of tar-macadam or pitch grouting, and the majority of the papers read at the Roads Congress at Cheltenham had reference to tar-macadam or some other form of bituminous paving.

Although tar-macadam is now recognised as one of the most useful road materials there are still too many failures with it for highway engineers to use it with the confidence that they desire. Not only is there a difference of opinion with regard to the nature of the binder to be used, but an even greater difference of opinion with regard to what is the best stone or other material required for tar macadam. While one surveyor swears by slag another prefers granite, and a third will only use limestone. That satisfactory roads have been made with tar macadam of granite, slag, and limestone, though with varying degrees of success so far as regards durability, proves that it is the binder which is the chief factor in the success or failure of the finished roadway.

It is generally agreed that tar-macadam of limestone makes a good road for residential streets with light traffic, but for main roads with heavier traffic it is not sufficiently durable, and is apt to become somewhat dirty in summer and quite smooth and slippery. Slag, when carefully selected, and mixed with the care that is exercised by our large manufacturers, has been very generally successful. On the other hand, much slag of a soft, sulphurous and honeycombed nature, has been sold, and has led to many failures. Granite, again, in many parts of the country has been most successfully used for the heaviest trafficked main roads; and probably in almost as many cases has not been a success.

From this we may safely assume that it is not so much the stone as the binder or method of mixing that is at fault. Twenty or thirty years ago it was not uncommon to find tar asphalt footpaths made with ashes, clinker, or pottery; and some of these, where there had been little traffic, when taken up within recent years, were found to be in almost as good a condition as when they were laid. The tar was as alive and viscous as when it was laid, and yet in another length of the same footway, made with the same materials, the tar had perished and the footpath become disintegrated with only a quarter of the life of the other. The care and experience in mixing is, again, a very important factor in the success of tar-macadam.

While makers of tarred slag and limestone have had many years' experience in mixing, granite quarry owners having had almost a monopoly in materials for ordinary macadam have only recently turned their attention to making tar-macadam. Again, a great part of the granite tar-macadam used up to the present has been mixed by surveyors in small districts with local gasworks tar of constantly varying character; and the general use of rule-of-thumb methods of testing has not been conducive to success. With greater attention to the proper mixing by gas managers, and more scientific methods of testing by surveyors, great improvements in our tar-macadam roadways may be looked for. The question, however, very largely in the hands of the [illegible] with, which will be preferred by most surveyors for [illegible] traffic. They could, however, use a suitable tar as a binder, and bring the [illegible] so generally done by the large firms making tarred slag and limestone, if they are to oust their formidable competitor.

[illegible]

In our issues of June 19 and July 3, 1914, an interesting and valuable article on "Fast Traffic, its Effect on Roads, and the Remedy" was published, and a leader on this, under the heading of "The Physical and Economic Aspect of Road Traffic Problems," appears in the first of the above issues. The article called attention to the destructive effect of the heavy motor traffic, which the writer thought was due not so much to the greater axle weights as to the greatly increased speed in all kinds of traffic at the present day. The damage [illegible] to mere abrasion of the surface, but causes rapid formation of potholes or corrugation, even when the road surfaces are surface-tarred and the road material of an excellent quality. Road engineers were divided into two schools the rigid and elastic. The rigid school depends for the stability and endurance of the road on mass in the foundations, and rigidity in the coat crust and wearing surface. The elastic school are trying to impart some degree of elasticity or resiliency to the road so as to supplement the cushioning effect of the springs of vehicles and rubber tyres. To effect this the elastic school advocate the use of a suitable bitumen and an aggregate of fine stone chippings, 2 in. thick in the middle and 1½ in. thick at the side as a top coat, to be laid as a thin coating or carpeting on to a new or partly worn surface of water-bound macadam. With exceptionally heavy traffic, or a greater thickness of material than 2 in., it should be laid in two coats, the bottom coat being coarser than the top coat, and taking the place of the binder, which will act as a resilient coat to cushion part of the shocks of the traffic which would otherwise be wholly borne by the top coat. One of the most interesting points of this article is the proposal to substitute a 12-in. clinker foundation for the ordinary concrete foundation which is so generally used with thin bituminous road surfaces, on the ground that such a foundation gives a greater resiliency than concrete. A road made under these conditions at Hornsey is cited as being very successful, and free from the waves or corrugations found in roads constructed with the same surfacing material, but with concrete foundations.

CHELTENHAM ROADS CONGRESS.

At the Cheltenham Roads Congress, the president, Mr. H. T. Wakelam, M.INST.C.E., in his opening address, spoke of the close connection there was between town planning and the laying out of arterial roads, and said he thought that arterial roads should be laid out first and town planning should come after. He also briefly referred to the important decisions given in the case of the canal bridge at Worcester, and that of the highway bridge at Crouch End over the Great Northern Railway, in which the courts have held that these old bridges must be kept in such a state of repair that they would be sufficiently strong to carry the traffic which might be reasonably expected to pass along the roads and over the bridges at the present time.

"Highway Law as Affecting the Municipal

Engineer was the subject of a valuable paper by Mr. Sydney G. Turner, ASSOC.M.INST.C.E., Barrister at law; and though the municipal engineer is not expected to be a lawyer he must, if he is to avoid getting himself and his council into trouble, have at least a knowledge of the leading cases dealing with the repair of highways, of extraordinary traffic, and other municipal works.

A short paper by Mr. J. Fred Hawkins, M.INST.C.E., on "The Control, Management and Maintenance of Roads," in which he advocated reducing to sixty the 650 rural authorities controlling roads, on the grounds of greater efficiency and economy in working, naturally provoked some opposition on the part of speakers from rural districts, who feared that the county surveyors wanted to "gobble them up," under the plea of more efficient control and management of the highways.

Considerable discussion took place on a paper by Mr. E. S. Sinnott, M.INST.C.E., on "The Prevention of Sub-crust Movement in Roads." While it was generally admitted that sub-crust movement took place on weak foundations, or on clay or marl, there was by no means general approval of the remedy proposed. To overcome the lateral movement in the sub-crust due to heavy traffic, Mr. Sinnott had designed a rigid framing to be placed at a suitable depth below the surface. This framing is constructed in ferro-concrete, although timber or other material could be used. The general opinion appeared to be that the rigid framing proposed by Mr. Sinnott was unnecessary and costly, and that simpler and more economical means could be adopted. Mr. R. J. Thomas and Mr. Wakelam, two very experienced county surveyors, were of opinion that, by strengthening the sides with good kerbs on concrete, or stones not less than 12 in. deep, and with proper drainage, or with a hand-packed rubble foundation little movement of the sub-crust would take place.

A valuable paper on "The Economies of Modern Methods of Road Construction," by Mr. Francis Wood, M.INST.C.E., was read. Attention was called to the increase in the cost of materials for road making, and the necessity of adopting more economical methods of using these materials. The effect of abrasion when stones are in contact with each other, and at the same time undergoing heavy pressure from traffic, is very great, and is increased by 50 per cent when moisture is added. To avoid this abrasion, bituminous macadam was recommended; and this Mr. Wood has laid 3 in. thick, at a cost of 4s. per super. yard for heavy traffic, and 2 in. thick for light traffic, at 3s. per yard. The paper may be taken as a plea for the use of bitumen instead of tar for mixing with macadam. Tar-macadam tried in Fulham has not been a success, but for the foundations for a top thin coat of bituminous mixture, the old macadam in the roadway was mixed with a special form of tar to make what Mr. Wood names "tar-concrete." The paper contains much useful information with regard to tarred and bituminous materials, and led to a very interesting discussion.

Some Practical Points on Modern Road-work was the title of Mr. W. H. Maxwell's paper, and this contains much useful information with regard to the laying out and construction of roads. Mr. Maxwell was of opinion that the great necessity for most of our roads is to first put in proper foundations and drainage before attempting to put down watertight surfaces. He questioned the wisdom of laying thin surface-wearing crusts or armourings of asphalt and bituminous preparations on existing macadam surfaces, except where an absolutely rigid and dry foundation can be relied upon. Some interesting notes with regard to the use of tar on macadam, mechanical haulage, and traffic statistics are also contained in the paper.

Dealing with somewhat similar matters to the above is the paper by Mr. George Green, M.INST.C.E., on "Grouting and Penetrating Methods of Road Surfaces." This paper dealt with various proprietary methods of making, spraying, or grouting roads; and it led to an animated discussion as to the efficiency or failure of the various methods mentioned.

OTHER PAPERS.

A paper on "Road Construction and Maintenance" was read at a district meeting of the Institution of Municipal and County Engineers at Birmingham by Mr. H. M. Lawson, the deputy road surveyor, and reported in our issue of March 6, 1914. The paper, which is well illustrated with detail drawings showing the various sections of roads and materials in use at Birmingham, dealt with a wide range of materials. Sett and armoured paving, asphalt macadam, asphalt, wood paving, and tar-spraying, all came under consideration, and led to a useful discussion.

A paper on "Traffic Factors," by Mr. J. Eastwood, ASSOC.M.INST.C.E., is published in Vol. clxxxvi. of the "Proceedings" of the Institution of Civil Engineers (see THE SURVEYOR of October 2, 1914). This paper dealt very fully with the various factors which bear on the question of wearing effect on road surfaces, which were summarised as follows: Road—Surface formation, foundation, gradient; class of traffic—weight, intensity of weight, description of tyres, speed, method of shoeing in the case of horses; weather conditions; width of road. A number of very useful tables of traffic factors are given, and the whole paper is particularly valuable to anyone who has to undertake a traffic census.

ROADS AND TOWN PLANNING.

The Town Planning Conference held in Liverpool in March last was largely occupied with the subject of "Roads in Relation to Town Planning." This was introduced by Mr. J. A. Brodie, M.INST.C.E., the city engineer of Liverpool, who drew attention to the need of careful planning for main traffic routes in advance of the laying out in detail of the different areas in a town. To avoid continual widening in the future it is necessary that roads should be made wider than is necessary for present-day requirements, though only such widths as are immediately required should be laid out as carriageways or footways, the other portion being left as grass margins. The provision of ring roads or routes round the city, as carried out in the Queen's-drive in Liverpool, which is 120 ft. wide and 2 miles long, was advocated, so as to allow traffic that did not want to go through the centre of the city to pass round clear of the congested area. The value of ring roads as open spaces and exercise grounds which partake of the character of elongated parks was also dwelt on.

The desirability of providing separate tracks for trams and rapid motor traffic is a matter of great importance, and Mr. Brodie laid special emphasis on the necessity for providing a specially fenced-off track in the roadway, so that the tramcar could be speeded up to compete with the motor 'bus or electric train service. This track need only be laid on sleepers in grass, at a cost of £3,000 per mile, against a cost of £6,000 per mile for an ordinary track. A wider road with a duplicate carriageway would be required, but the saving in track costs would pay for the increased cost of the wider road. The main difficulty in getting wide arterial roads does not lie with the larger boroughs, who are generally alive to the advantage of wider roads, but with the small outside authorities who do not look so far ahead, and who are generally unable to find the funds to carry out such improvements. The feeling was strongly expressed at the conference that there should be a meeting of the various authorities concerned to see if they could agree to some action which would result in the improvements initiated in the large boroughs

being continued in the smaller urban or rural districts.

At the same meeting the city engineer of Birmingham, Mr. H. E. Stilgoe, M.INST.C.E., described the lay out of the Birmingham town planning scheme, which showed that the main roads now running into the city radiate to the centre, compelling all through traffic to pass right through the heavily trafficked streets of the centre of the town. To relieve the centre of this undesirable traffic a great ring road 100 ft. wide is to be laid at an average distance of 1 mile from the city boundary. Inner ring roads are to be laid out to join up the radial roads nearer the centre. An interesting feature of the Birmingham scheme is that the corporation have been able to get the owners to agree to give up land to enable the corporation to widen some of the narrow highways to 100 ft., and in return the corporation permit the landowners to construct their estate roads on a less costly scale. The difference in cost between the 100-ft. arterial road and the 42-ft. street required by the by-laws is borne by the corporation.

A somewhat similar tramway track to that carried out by Mr. Brodie at Liverpool to the Seaforth end on Sea light railway extension on the Thornton Hall Boulevard, which is described in a paper by Mr. E. J. Elford, M.INST.C.E., read at a meeting of the Institution of Municipal and County Engineers at Southend and published in THE SURVEYOR of June 12, 1914. The roadway is 100 ft. wide, has two carriageways and footways, and a central tramway track enclosed with dwarf kerbs. The rails are laid on Jarrah sleepers on screened gravel. The ballast is brought up to the top of the sleepers, and it is intended to cover this with soil level with the top of the rails, and sow the surface with grass after the track has taken its bearings. A short trial length with reinforced concrete sleepers is laid down, but the Jarrah sleeper is used for the greater length as being less expensive, more resilient, more easily packed, and likely to be less noisy, although possibly having a shorter life.

In our issue of May 22, 1914, we discussed the proposed motor speedway between London and Brighton. This roadway was to be 150 ft. wide, and cost £5,000,000. Few details of this motor road have been published, but it is a scheme which all highway engineers will follow with interest should it get beyond the proposal stage.

THE TRAINING OF HIGHWAY ENGINEERS.

"The Training of Highway Engineers" was the subject of a very able and useful paper by Mr. H. Percy Boulnois, M.INST.C.E., read at the annual meeting of the Institution of Municipal and County Engineers, and further attention to this subject was drawn by the report of the Special Committee appointed by the Institution of Civil Engineers to consider the "Practical Training of Engineers." As was to be expected from a municipal engineer of Mr. Boulnois' experience and standing, his paper was full of practical suggestions, and was especially useful to the younger highway engineers. He called attention to the great change taking place in the traffic on our roads and the necessity of adopting more scientific methods of road making in order to cope with the greater weights and increased speeds of the vehicles using the roadways. He suggested that a new profession of "Highway Engineer" was on the eve of formation, and that the question of his training was worthy of consideration.

While Mr. Boulnois is far too practical a man to imagine that technical calculations and laboratory experiments are sufficient to make good roads, he considered that all highway engineers should combine a knowledge of these matters with practical experience of road making. He quoted with approval the subjects taught in the Columbia College, New York, as a special course of training in highway engineering, and with the recent appointment of Mr. Matthews as the Professor of Municipal Engineering at the London University we may be considered to have made some progress towards the goal at which he aims. While, however, he advocates technical training in colleges, he agrees that this must be followed by practical experience obtained as an articled pupil under a responsible road engineer or surveyor. He very wisely says: "Intuition, common sense, originality, a knowledge of men and how to handle them, the value of materials, and many other subjects cannot be taught in the 'schools,' and can only be acquired when the 'rough and tumble' of the professional life is commenced, and it would be during his pupilage that the young highway engineer would acquire these necessary additions to his store of knowledge." He believes, however, that this demand for more science should also be accompanied by a demand for more pay.

The report issued by the Institution of Civil Engineers on "Practical Training of Engineers" was the result of an inquiry held on March 31, 1913, but only published in the autumn of last year, and attempts to define and regularise the conditions of practical training for young engineers who might be likely to seek admission into the institution. It was intended to apply to two classes of young men, namely:

(a) Those who take a regular pupilage or apprenticeship, but who do not receive systematic collegiate technical education; and

(b) Those who take a three-year course in good engineering colleges and obtain degrees or diplomas recognised by the institution as exempting from the associate membership examination, with a shorter period of practical training.

The inquiry was conducted by Dr. W. C. Unwin and three members representative of the municipal engineering profession in the persons of Sir Maurice Fitzmaurice, Mr. J. A. Brodie, and Mr. S. S. Platt, with the secretary of the institution, formed the committee of inquiry. The inquiry largely turned on the question of the merits of pupilage *versus* college training, and while the chairman, as an old University professor, was supported by Mr. Platt, in his preference for college or university training first and pupilage after, Mr. Brodie was strongly in favour of pupilage, followed by instruction at night in a good college or university. Mr. Brodie put the matter in a nutshell by saying it was a "question of the well-educated average man with good practical ability, as compared with the highly educated man without the practical ability. My own view is that the practical man will come through at the finish." Mr. Platt had made up his mind not to take any more pupils unless they had had three years' technical college training, but Mr. Brodie did not agree with that. He said: "I want a good standard of engineering education. If you give me a man who has worked in the office and on the works, and educated himself up to the same standard as he gets at the university, I will take him every time in preference to the university man."

It has for many years been a matter of complaint that the examinations held by the Institution of Civil Engineers are simply of an academic character, suited to the students of the professors who act as examiners, and that a young engineer's practical training is not of the slightest use to him in these examinations. Mr. Brodie, in his outspoken remarks to the chairman, said: "We know cases where people have got through your examinations who probably would not get through the examinations of the Institution of Municipal and County Engineers, because the latter body, before passing any of their people, bring these men into a room and put them through a *viva voce* examination with the object of testing their practical knowledge of engineering."

The essentially sane, common-sense point of view adopted by Mr. Brodie, in which he was to a very

large extent supported by Sir M. Fitzmaurice, must commend itself to all municipal engineers, and especially highway engineers; and it is a matter of congratulation that the Institution of Municipal and County Engineers have during the past year decided to adopt a special examination for county and highway engineering. That this will lead to a closer study of the theoretical and scientific side of highway engineering, while giving due weight to its practical side, there can be no doubt; and it is to be hoped that the younger members of the profession will rise to their opportunities by obtaining the certificate for this examination.

HOUSING AND TOWN PLANNING.

A large number of housing schemes have been taken in hand during the past year, and however much this important work has been neglected in the past, since the Housing and Town Planning Act of 1909 came into force neglect and apathy have disappeared. Instead of housing schemes being confined to a few large towns, we now find small towns and rural districts in all parts of the country taking up this matter and spending large sums of money on this very necessary branch of municipal work. Not only is the pressing need of more housing accommodation recognised, but one of the most remarkable features about the housing schemes of the past year is the large number of schemes which are being carried out as the result of open competitions. This denotes an improvement in the public taste, for whereas a few years ago it was considered that any unlovely box of a cottage of the cheapest and plainest character, or a barrack-like tenement, was good enough for housing the working classes, we now find that many of the best architects in the country are giving their attention to this matter and competing for the privilege of designing this class of building.

Among the more important housing schemes for which competitions have been held by local authorities may be mentioned those promoted by the Corporations of Manchester, Liverpool, Chester, Doncaster, and Southend. Several smaller places have also held competitions, and those which have been decided have elicited keen competition. It is pleasing to find that in several competitions young architects have been successful, and, in one case at least, with a somewhat notable departure in style from that usually found in cottage design.

In other directions efforts have been made to provide a better planned and more attractive elevation for cottages, and two important competitions which have been held with this view are those promoted by the publishers of *Concrete* and *Country Life*.

Although both these competitions were promoted to meet the Government's proposal to build one 100,000 cottages, they differed very largely in character. The cottages in the *Country Life* schemes were intended to house agricultural labourers, and a special feature was to be made to preserve local characteristics in the building, to use as far as possible local materials, and to exclude modern substitutes for bricks, stones, tiles, and slates. The proprietors of *Concrete*, on the other hand, while desiring designs suitable for different types of small cottages, wanted concrete to be used as far as possible to illustrate new materials and new methods of construction, and the designs were to give careful consideration to the economies that could be effected by the use of these new materials and methods.

In the *Country Life* competition £514 was awarded in premiums for some eighteen different designs suitable for fifteen different counties, and nearly 1,500 designs and models were sent in by 900 competitors. Two types of cottages were required, one somewhat larger than the other, with the maximum floor areas and cubic capacities recommended by the Small Holdings Committee Report, and to provide a living-room, scullery, pantry, and three bedrooms. The average estimated cost for a pair at 1*d.* per cubic foot was £360, or nearly £180 per house, which is very near the cost per house most cottage schemes work out at.

Costs vary considerably in different parts of the country, but the £180 may be taken as a price at which a suitable cottage could be built in most parts. Lord Salisbury, in opening the Liverpool Town Planning Conference, stated that "he had proved that they could build a first-rate cottage for £200, a very nice cottage for £150, and he was now absolutely building a very adequate one for £130." The size of the rooms and the quality of the materials and workmanship must differ considerably to bring about such great variation in price. It need only be said of the *Country Life* designs that they provide a very attractive type of cottage, and could in most cases be built for something near the estimated cost; but there are one or two of the designs which are like a small manor house, and which could hardly be built in suitable materials for £250 per house. A special competition for a pair of houses to cost £250 the pair was also held, and attracted some very interesting schemes. The first premiated scheme was well planned, with a roof of the mansard type. The outer walls were thin concrete slabs, which would not comply with the model by-laws; but most of the other schemes submitted were for brick walls—hollow or solid—and would comply with the by-laws in most districts, though the height of the rooms—8 ft. on the ground floor and 8 ft. 6 in. for two-thirds of the height of the bedrooms on the first floor—would not meet the requirement of many towns and urban districts.

The £125 Concrete Cottage Competition was in many respects much more interesting than the *Country Life* competition. £215 was given in prizes, and some 249 sets of drawings were submitted. The conditions of the competition required a design suitable for execution mainly in some form of concrete instead of in brick, tile, slate, stone, or carpentry. The accommodation required was practically the same as in the other competition—kitchen or living room, scullery, and three bedrooms, with places for food, fuel, and sanitary convenience. The price of £125 was exclusive of builder's profit, sanitary fittings, fences, and land drainage, &c., which would almost certainly add another £25 to the cost, and so convert the £125 into a £150 house. The height and area of the bedrooms is a matter of great importance, though few by-laws make any provision dealing with the area or cubic space of living-rooms. Mr. Arnold Mitchell's famous £100 cottage was in most persons' minds altogether too small in area to provide sufficient air-space for any one to live in with comfort or health. The winning design by Mr. E. S. Thompson, 5 Victoria-street, Westminster, London, S.W., which is given in THE SURVEYOR of July 10, 1914, is for a single cottage of one story, the walls, roof and floors being concrete, and has a living room of 185 ft. area, scullery 56 ft., 3 bedrooms 102 ft., 106 ft., and 125 ft. in area respectively, and the height of the rooms is 8 ft. A small larder, water-closet, and fuel-store are all under the main roof, which is flat.

Other large housing schemes being carried out without competition are the Rosyth scheme, on which the Government propose to spend a million pounds and erect 8,000 houses; the Port of London scheme for 164 houses, laid out 22 to the acre; Eastbourne 143 houses, Kilmallock, Ireland, 243; Greenock 250, and Hull 252.

A report on the wretched housing conditions in Dublin was presented by a departmental committee (see THE SURVEYOR, April 24, 1914), who recom-

mended the rebuilding of the slum areas of the city, and the erection of 11,000 houses at an estimated cost of £3,500,000. As there are, according to Mr. Birrell, 20,108 families occupying one-roomed tenements, it cannot be said that the recommendation is not needed.

An interesting experiment is to be made in Manchester, where the council in May last approved a scheme for spending £8,973 on furnished houses in Rochdale-road. It was stated that the number of people using lodging-houses in Manchester is from 60,000 to 80,000, and that this roving population never possessed enough furniture to load a hand-cart. It is proposed to build houses with three independent living rooms, and let each room at a nominal rent by the day or week. Nearly all the furniture will be fixtures, and cookery utensils and crockery will be provided. The scheme was opposed by a deputation of clergy, who waited on the Lord Mayor, as they feared that a certain percentage of the houses would become hotbeds of vice.

The Government's Bill for providing three millions of money to meet the deficiency of housing accommodation in rural areas will do much to remove what has become a national evil. To arrest the depopulation of the country and the overcrowding of the towns a large number of low-rented cottages will have to be erected, and the Government scheme has the support of all parties.

A number of housing schemes have been illustrated in our columns during the past year, among them being schemes at Atherstone, Cheltenham, Dover, Southwold, Abersychan, Evesham, Hinckley, and Tilbury.

The housing question was dealt with in several papers at the Town Planning Conferences at Cheltenham and Liverpool. At Cheltenham the city engineer of Coventry, Mr. J. E. Swindlehurst, M.INST.C.E., dealt with the "Abnormal Development of Coventry, and Some of its Town Planning and Housing Problems," and gave some very useful information with regard to the types of houses being built, and the lay-out of the working-class areas. Mr. J. C. Midgley, the deputy surveyor of Newcastle-on-Tyne, dealt with the "Housing and Town Planning Act, 1909, as Applied to Commercial and Industrial Districts," and Mr. Ernest Holloway, surveyor to the Evesham Rural District Council, read a paper on "Housing in Rural Districts."

At the Liverpool Conference Mr. F. T. Turton, the deputy surveyor, opened a discussion on "Urban Housing," and dealt with the impossibility of removing slum dwellers into the outskirts of the town, and the necessity for the corporation to provide housing accommodation in close proximity to factories and the dock area. He thought that tenements were a necessity, but he had tried to get away as far as possible from the tenement appearance by giving every tenement a front door leading from a balcony. The tenements worked out at about fifty to the acre. Self-contained houses worked out on another site at thirty-one to the acre.

"Suburban and Rural Housing" was dealt with by Mr. Percy T. Runton, A.R.I.B.A., the architect of the Hull Garden Suburb. He gave some very useful information with regard to the cost of detached and semi-detached houses, and estimated that a detached house costs 12 per cent. over the cost of houses in groups of six. The effect of concrete construction was discussed, but did not find favour for cottages; and the effect of standardisation of fittings and economic methods of construction was also dealt with. Mr. Henry Vivian dealt with "The Co-partnership System of Housing," and Mr. E. C. Culpin with "The Garden Suburb."

TOWN PLANNING.

The feeling on the question of town planning between the architect and engineer is not so acute as it was a few years back. Each now recognises that the other has his place in a well-designed scheme. In the accepted scheme for the laying out of the Australian capital there were engineering mistakes that could only be made by an architect, but at the same time it displayed architectural qualities that few engineers could hope to possess. The architect is obsessed with the view that physical difficulties must give way to a symmetrical arrangement on his plan, and he frequently shows an utter disregard to economical construction in his efforts to produce artistic effects. An engineer would never design roads with a gradient only suitable for a rack railway, nor would he dream of erecting an important building on an old river-bed, or of making a symmetrical lake of such a size that all sense of symmetry is lost in space. He is, however, at times too practical to grasp the artistic possibilities of a well laid-out town, and it is for this reason that an interchange of ideas between architects and engineers on the subject of town-planning is so valuable. They can each correct the other's faults, whether it is in the matter of temperament or training. It is for reasons such as this that Town-planning Conferences like those at Liverpool and Cheltenham are so valuable, affording as they do so many opportunities of comparing notes and interchanging ideas.

The conference at Cheltenham held at their annual meeting by the Institution of Municipal and County Engineers was not only of a very interesting character, but was particularly instructive owing to the valuable collection of town plans which were exhibited. It was one of the most complete collections ever got together, and showed the best examples of Continental, American, Colonial and British town plans. Some of the many garden suburb schemes, with their family resemblance, might perhaps have been spared, and the many exhibits of a purely historical or local character from Germany might with advantage have made room for more modern and more interesting work; but still, taken on the whole, it was probably the most interesting collection of town plans that has yet been got together.

Particularly interesting to municipal engineers, as representing the official engineering side of town planning, were the large cartoons showing the Birmingham, Liverpool, Newcastle, and Dundee schemes: the scheme by Mr. J. Thomson, M.INST.C.E., the City Engineer of Dundee, being shown by, perhaps, the finest set of drawings in the exhibition. Not only was the scheme an exceedingly clever piece of planning, but the buildings were architecturally and monumentally fit to compare with the public buildings of any other city in this country. The unofficial town planner was worthily represented by the premiated designs for the town-planning competitions held at Halifax, Huddersfield, Oldham, and Ruislip-Northwood, though some of these were really estate development plans rather than town-planning schemes in the widest sense. America, Canada, and New Zealand sent a number of very fine plans, in which landscape gardening played the most prominent part. School playgrounds and shelters at Chicago and Ohio, the lay-out of parks at Sacramento and Schenectady (New York), waterfront developments at Toronto, and the town plans of Washington, Boston, and Vancouver all showed the high state of development of town planning on the western side of the Atlantic. Australia was represented by some of the competition plans for the Federal capital, India by plans for city improvements at Lashkar, lent by Mr. H. V. Lancaster, F.R.I.B.A., and Calcutta by the plans and reports lent by the ex-city engineer, Mr. E. P. Richards, M.INST.C.E. Germany's principal town-planning schemes, and plans of the towns in the Netherlands, Italy, France, and Russia were all exhibited. A large number of housing schemes and plans dealing with condemned areas, the premiated designs for artisan dwellings and public parks in the competitions held by the Institution of Municipal and County Engineers, the valuable collection of photographs lent by Professor Geddes, and the set of diagrams by Mr. Raymond Unwin, F.R.I.B.A., were all exhibited, and offered opportunities of study which no town planner could afford to neglect.

Though less complete in many respects than the exhibition at Cheltenham, that at the Liverpool Town Planning Conference was very interesting, and particularly so to local enthusiasts. There was a very fine collection of plans and engravings of old Liverpool, a model of Port Sunlight, Mr. T. H. Mawson's designs for laying out Vancouver and Saskatchewan, and the replanning of Bolton, and Mr. H. Chalton Bradshaw's *Prix de Rome* drawings for a "Civic Centre in a Great City."

One of the most interesting events of the past year has been the commission given to Mr. T. H. Mawson by the King of Greece to prepare plans for the extension and remodelling of Athens.

Other important town planning schemes which may be noted are those for replanning the central areas of Blackburn, Exeter, and Bradford. The Blackburn scheme is the joint work of the borough engineer, Mr. W. Stubbs, A.M.INST.C.E., and Mr. Walter Stirrup, F.R.I.B.A., a local architect; and the scheme for the replanning of the centre of Exeter has been prepared by Mr. Mawson. The scheme for the replanning of Bradford is thrown open to competition, three prizes being offered of £500, £300, and £200, and Mr. Reginald Blomfield, A.R.A., is the assessor. A competition has also been held for a rebuilding scheme in the city of Glasgow, and for a town planning scheme for the city of Dublin, for which the Lord-Lieutenant offered a prize of £500.

During the past year several works on town planning have been published, but by far the most important and ambitious is that published in Paris by H. C. Anderson on the "Creation of a World Centre of Communication." Strictly speaking, this book was published in 1913, but only introduced to the notice of town planners here early last year. This, in the opinion of the authors, Messrs. Anderson and Hebrard, is to be an International Centre of Civilisation, and comprise three parts—a Physical Culture or Olympic Centre, an Art Centre, and a Scientific Centre. The Olympic Centre has a very large stadium and a huge natatorium facing the sea, with gymnasiums for men and women to the right and left. The Art Centre contains a central temple of art, a conservatorium for music and drama, with museums, schools, and libraries. The Scientific Centre is dominated by a Tower of Progress over a thousand feet high. Everything is planned on a gigantic scale, and the book is a monument to the industry and skill of its authors. It is on too large a scale to find a place in many private libraries, as it is 18 in. long by 12 in. broad, and weighs 10 lb. Whether it is possible or desirable to carry out such a scheme is extremely doubtful, but its value to the student of town-planning is unquestionable. It is particularly valuable to the municipal engineer in that it forms a corrective to his all too practical work, and enables him for a time to soar into the clouds beyond the reach of the parsimonious ratepayer.

MUNICIPAL AND PUBLIC BUILDINGS.

While municipal activity in this country during the year 1914 has again been chiefly directed towards improving the housing of our working-classes, there have, both at home and abroad, been many important schemes launched for buildings of a large and monumental character. Among the latter may be mentioned the Government buildings at Delhi, the proposed Federal Parliament House in the new Australian capital of Canberra, and the Board of Trade Offices between the Embankment and Whitehall. The Government buildings at Delhi are estimated to cost £2,800,000, while the cost of the whole scheme is estimated at £6,000,000. The drawings of the Secretariats and Government House at the New Delhi, which form the huge block of buildings designed by Mr. E. L. Lutyens and Mr. Herbert Baker, were exhibited at the Royal Academy last year. Though the drawings were of a somewhat sketchy and impressionist character, they were sufficient to show that the aim of the architects, as set forth in their report, is likely to be realised. This was "to express the ideal and fact of British rule in India, of which the New Delhi must ever be the monument."

The Australian Government last July announced an international competition for the purpose of selecting the architect of the Federal Parliament House, on which the outlay was not to be more than a million pounds. Only outline sketch designs for the building were requested, and eight prizes, amounting to £6,000, were offered, the first prize being £2,000. The designs were to be submitted by the end of March, 1915, in either Melbourne or London, to a jury of architects, whose decision was to be final. The architects who were to act as assessors were Mr. G. T. Poole, Australia; Sir John J. Burnet, London; M. Victor Laloux, Paris; Herr Otto Wagner, Vienna; and Mr. Louis H. Sullivan, Chicago. This competition promised to be one that would attract many of the leading architects in this and other countries, as, unlike the competition for the lay-out of the Federal Capital, in which the final decision was reserved for a member of the Australian Ministry, the decision now lay in the hands of experts who have the confidence of the architectural profession. Unfortunately, the war has made so many demands upon the architectural profession of this and other countries, that it has been decided to postpone the competition for a time. It is to be hoped that as so much dissatisfaction was, and is yet, felt over the result of the former competition for laying out the capital, the opportunity may be taken of holding a new competition which will attract a much wider and more important body of town-planning experts than was the case in the previous competition.

At home, the competition for the Board of Trade Offices led to the submission of 187 designs, and the authors of ten of the designs, who were each given an honorarium of £300, were selected to take part in a final competition. The cost of the two blocks of buildings is likely to be over £500,000, and the assessors are Sir Aston Webb, Mr. Reginald Blomfield, and Mr. Ernest Newton.

Another important competition, limited to half a dozen architects, was that held by the Metropolitan Water Board for new central offices on a site in Rosebery-avenue. The successful architect was Mr. H. Austen Hall, F.R.I.B.A., and the estimated cost of the building is about £100,000.

Sixty-nine sets of designs were submitted for the Belfast Public Art Gallery and Museum Competition, and exhibited in May last in the Ulster Minor Hall, Belfast. This building, as is becoming so much the fashion now, is to be erected in a public park; and it was necessary to provide a separate entrance from the public roadway for use at such times as the main entrance from the park was not available.

The tendency to place our art galleries and museums in beautiful surroundings such as a park affords has much to recommend it, and has already been adopted in Manchester, Bradford, and other towns.

Considerable progress has been made during the past year with the London County Council Hall on the Thames Embankment, but it must be some years yet before we can look for its completion.

Two important buildings recently completed in South Africa are the Johannesburg Town Hall and Municipal Buildings, erected at a cost of £300,000, and the new Law Courts at Capetown, which cost £220,000. In both these buildings reinforced concrete was very largely used.

One of the most important buildings commenced during the past year is the Glasgow Municipal Buildings, the foundation-stone being laid by the

King in July last. The cost of this building is estimated at £168,228, of which £137,728 is for new buildings, and £30,500 for altering the existing buildings.

Competitions for town hall schemes have been held for the Barnsley, Dudley and Middleton Corporations, and the first premium for the last-named scheme was awarded to one of the most brilliant draughtsmen in the architectural profession—Mr. Alick G. Horsnell. Other competitions have been under consideration for new town halls at Newcastle-on-Tyne and Warrington.

Among public buildings described in our columns may be mentioned the new public offices for Hartlepool (April 3, 1914), the Newburn Council Offices (April 17, 1914), and Ipswich Public Health Offices, which were described in a paper read at Ipswich by the borough surveyor, Mr. J. R. Mead, at an Eastern District Meeting of the Institution of Municipal and County Engineers, the paper being published in THE SURVEYOR on May 22, 1914.

[illegible]

During the past year the London County Council have made somewhat of a new departure by holding competitions for two schools—one at Latchmere-street, Battersea, and the other at Billingsgate-street, Greenwich. The designs of new schools have hitherto been made by the official staff of the Superintending Architect's department, and probably it was hoped to introduce new ideas by holding a competition, though nothing very novel was to be found in any of the designs submitted. Fifty eight designs were sent in, forty-five being for the school at Battersea and thirteen for the Greenwich school. The Battersea school was awarded to Mr. Arnold Mitchell, F.R.I.B.A., and Messrs. Wright and Chapman obtained the Greenwich school. The Battersea school is a one storeyed building of reinforced concrete and reinforced brickwork, and the estimated cost of the building at 8d. per cubic foot is £18,097, which works out at £14 9s. 1d. per place, there being 1,252 places in the school.

The Southport Education Committee in July last invited architects to submit designs for new technical schools, and offered premiums of £75, £50, and £25 for the three best designs, Mr. Paul Waterhouse being the assessor. The school is to have its main frontage to Lord-street, is to accommodate 250 male and 250 female students, and have a large examination hall, education offices, engineering laboratories, building workshops, natural science, chemical and physical laboratories, commercial and domestic departments, and a school of art.

A technical institute is also to be erected at Coventry at a cost of £24,500. The Tottenham Education Committee are to erect a school for 900 scholars, 300 each for junior boys and girls and infants.

A school erected at Ealing by the Middlesex Education Committee is described in our issue of April 24, 1914, and is interesting on account of the extensive use of reinforced concrete carried out on the Indented Bar and Concrete Engineering Company's system.

A large open-air school is to be erected in Lodercoad at an estimated cost of £19,250 for the Brighton Education Authorities; another open-air school is to be built at Huddersfield.

The growth of the open-air school has not been so rapid as could be desired, when one considers the many advantages it offers from the hygienic and economic point of view. It is proved beyond doubt that the children trained in these schools are better physically and mentally then those educated in the ordinary type of elementary school, which is so frequently badly ventilated and lighted. The buildings need only be of an inexpensive type, and the only difficulty with many education authorities is to find suitable sites within reasonable distance of the scholars' homes. Apart from the health point of view, pleasant surroundings have great educational and moral value, and it is therefore very desirable that these schools should be built in a large open space, preferably enclosed as a garden or a small park. In addition to the ordinary classrooms and teachers' accommodation, a resting-shed, dining-room, kitchen, and baths are required in an up-to-date open-air school, for, if pleasant surroundings are to be obtained, it may mean that the scholars will be too far from their homes to go there for their mid-day meal, and provision has to be made for many of the children to get it in the school. The health of the child is becoming a matter of vital national importance, and good feeding is quite as essential to the child's well-being as good teaching.

The Building Regulations for Public Elementary School have been revised during the past year, and new regulations have been issued giving full instructions with regard to the principles of planning and fitting up new schools. These regulations, on which some comments were made in our issue of July 31, 1914, are worthy of careful study by all who are engaged in the design and maintenance of school buildings.

[illegible]

A large number of [illegible] baths and washhouses have been [illegible] or completed during the past year, and while the more general supply of domestic baths which are now found even in small cottages makes it unnecessary to provide so large a number of slipper baths [illegible] it is considered advisable to provide a limited number, particularly in the case of [illegible] Through swimming in winter is indulged in by an increasing number of people—and there does not appear to be any reason why with good heating arrangements it should not be much more generally [illegible] baths ought to be designed with a view to converting the bath hall in winter into a gymnasium or a small public hall for cinema or other purposes.

In our large inland health resorts great sums have been expended in order to bring their baths into line with the fashionable Continental spas; and there can be no doubt that the opportunity offered them by the war will be readily accepted, and that they will gain much of the custom that has fallen to Homburg, Marienbad, and other German and Austrian spas.

Turkish and other similar baths are very popular at all our leading spas such as Bath and Harrogate; but in the case of small authorities it is questionable whether there is a sufficient demand to justify the expense of installing these rather costly luxuries. It may be possible to adopt some cheaper form of Russian bath, especially in the colliery or ironworkers' districts; though the average collier has not yet been persuaded of its necessity, and has not taken too kindly to the offer of providing baths at the pithead.

Open-air baths are becoming more popular, and appeal more to English tastes than the indoor heated baths; and there appears to be every likelihood of their number being largely increased in the near future, and especially in the case of seaside resorts.

The provision of washhouses is by no means so general as the provision of baths, and, except in the case of the poorest classes, it is questionable whether they are ever likely to become popular. Steam laundries have now become a very important and lucrative business in all large towns; for in most cases householders find it more convenient, and often more economical, to send their washing to a laundry than to get the washing done at home with the aid of a washerwoman. Still, in large industrial towns there is no doubt that there is a demand for washhouses, and this demand is met to a very great extent by the municipal authorities.

Among the larger authorities erecting baths may be mentioned the Sheffield Corporation, who are proposing to erect baths and washhouses at an estimated cost of £24,214; the Coventry City

Council, who are to spend £15,000 in extending their baths; Birmingham Corporation, who are to spend £19,262 at Saltley; Preston Corporation, who, after many years' consideration, are going to erect baths at a cost of £17,000; Darwen, £6,550; Deptford, £6,500; and Renfrew, £6,000.

A competition for a bath at Hendon has recently been decided, the first premium having been awarded to Mr. T. Millwood Wilson, L.R.I.B.A.

Rough sketch plans have been presented to the Bath Corporation Baths Committee by their architect, Mr. A. J. Taylor, for the enlargement of the bathing establishment. The cost of the buildings, fittings and furniture is estimated at £48,132. Another £5,000 is to be spent on an arcade promenade, new lounge at the Pump Room, and additional pumping plant; and with contingencies and the cost of the site the total cost will amount to £86,860.

Open-air swimming-baths, other than those at the seaside, for which the Local Government Board have been asked to sanction loans, are the baths in Bushey Park, and Lister Park, Bradford. The bath in Bushey Park is to cost £1,150, and is to be supplied with water from the Cardinal Wolsey River, which irrigates Hampton Court Garden. The bath in the Lister Park is to cost £5,740.

New public washhouses and wash-baths have been opened during the past year in New Quay-street, Manchester. The wash-bath has nine wash-baths for men and seven for women, and the wash-house has sixteen stalls, sixteen drying-houses, hydro extractors, steam-driven mangles, and all the up-to-date equipment of a modern laundry and wash-bath. Special provision is made for school children having free bathing.

Further public washhouses are to be erected in various parts of Manchester amounting to 142 washing-stalls, estimated to cost £17,530.

SANATORIA AND HOSPITALS.

Several large schemes for sanatoriums and hospitals have been decided on during the past year. Bradford is proposing to construct a new infirmary at a cost of £200,000. The King Edward Memorial Hospital at Hastings is to cost about £50,000. Salford Corporation are to erect a new tuberculosis sanatorium at Nab Top, Marple. The Metropolitan Asylums Board, Middlesex County Asylums Board, Wilts County Council, Essex County Council, and the corporations of Oldham, Rochdale and Southend all have schemes for erecting sanatoriums.

As an offset to this activity, attention may be called to a list of counties and county boroughs who have not yet provided sanatorium accommodation. This was given in the House of Commons in March last by Mr. Herbert Samuel, and may be found in our issue of March 20, 1914.

On February 13th of last year the Local Government Board issued a new "Memorandum on Provision of New Residential Institutions for the Treatment of Pulmonary Tuberculosis," which had been prepared to afford local authorities and others further assistance in the provision of special residential institutions for permanent schemes for treatment of pulmonary tuberculosis. The memorandum, which was published in The Surveyor, February 20, 1914, dealt very fully with the question of economy in building, site, subsoil, drainage, water supply, ease of access, the buildings needed, and the accommodation required for patients. The memorandum contained a number of interesting plans, and very clear and concise particulars as to the requirements in the various buildings, and will repay careful study by any one having to provide sanatorium accommodation.

A new annexe to the Whittingham Asylum, erected for the Lancashire County Council at a cost of £154,000, was opened last year.

OTHER BUILDINGS.

Among other buildings described and illustrated in our columns during the past year may be mentioned the Bemerton main sewerage pumping station, May 22, 1914; Southend-on Sea refuse destructor and pumping station, and pier, June 12, 1914; Lytham refuse destructor and pumping station, and slaughterhouses, June 19, 1914; and the Basingstoke electricity station, October 23, 1914. Slaughterhouses are to be erected at Nelson, £14,000, and at Liverpool £30,000.

REFUSE DISPOSAL.

There still remain a large number of places where the methods in use for the disposal of refuse are unsatisfactory, and where they not only constitute a nuisance, but may even be dangerous to health by contaminating the water supply. The whole subject was dealt with in an admirable lecture delivered at University College a short time ago by Prof. E. R. Matthews, Assoc.M.Inst.C.E., Chadwick Professor of Municipal Engineering in the University of London. This lecture was printed in these columns on November 13th last, and those of our readers interested in the subject may refer to it with advantage.

METHODS OF COLLECTION.

The question as to the best type of vehicle to adopt for the collection of house refuse has been discussed on various occasions. Early in 1914 an important report in connection with this subject was made to his council by Mr. J. G. Carey, engineer and surveyor to the Heston and Isleworth Urban District Council. After making trials in the actual collection of house refuse with an electric motor vehicle, a superheated steam wagon and a petrol wagon, it was found that the greatest saving over horse traction was shown by the electric motor vehicle—viz., £71 12s. 11d. per annum if the council's horses were used, or £145 4s. 6d. per annum on the basis of hired teams at 9s. 9d. per day. The steam wagon showed savings of £66 13s. 9d. and £140 5s. 4d. respectively. We do not understand why two days per month were allowed for overhauling the steam wagon, while only one day per month is allowed for the same purpose in the case of the electric vehicle. If this item in the two calculations were estimated at the same figure, the results would be entirely in favour of the steam wagon, especially as the steam wagon can draw a trailer, whereas the electric vehicle cannot do so. We understand that the council eventually decided to purchase the electric vehicle, but we do not think that the results of the trials demonstrated any great advantage, if any, over the steam wagon, and it would be very interesting to have further tests made with different types of vehicles under uniform conditions of working.

Some interesting information was collected early in the past year by Mr. J. W. Walshaw, city surveyor of Peterborough, with regard to the hours of refuse collection. It was ascertained that in fourteen towns the hours were practically the same as at Peterborough—from 8 a.m. to 10 a.m. in the town itself, and from 7 a.m. to 4.30 p.m. in other parts. In four towns the work was finished at 9 a.m., and in two other places at noon.

REFUSE DISPOSAL IN CAMPS.

The article on this subject, contributed by Mr. G. Bertram Hartfree, F.S.I., engineer and surveyor to the Alton, Hants, Urban District Council (The Surveyor, October 30, 1914), was very interesting and altogether practical. The extremely unsatisfactory conditions which arise, particularly in connection with hospitals for the wounded, render the provision of suitable

destructors of prime importance, and, as it is impossible to construct modern permanent destructor installations in the time at disposal under such conditions, Mr. Hartfree's suggestions for rough and ready incinerators, which can be constructed from almost any material, should be very useful.

We understand that a trial is being given by the War Office to a new form of refuse disposal specially suitable for camps, and we shall hope to have some record of the results obtained in due course.

CONVERSION INTO MANURE

In the lecture upon refuse disposal by Prof. E. R. Matthews, mentioned above, reference was made to the difficulty of utilising house refuse as manure, and the failure of three factories in France, erected for the purpose of pulverising refuse and rendering it suitable for use as manure, was quoted. It was alleged that the farmers found the product of these factories excellent at first, but that after three or four years they found that its beneficial effect had lessened, and that the land needed a change, with the result that the farmers discontinued the use of the manure and the companies failed. It would have been interesting to learn whether the manure maintained the good qualities it is stated to have possessed at first, and whether it was properly applied by the farmers.

The statements made in the lecture brought a letter of protest from the Patent Lightning Crusher Company, Limited (THE SURVEYOR, November 27, 1914), pointing out that in this country the use of manure produced from house refuse by means of this firm's crusher is continually increasing. The quantities sold by the Metropolitan Borough of Southwark alone have risen from 2,206 tons in 1907 to 19,495 tons in 1914, and the demand now exceeds the supply. Further, it is stated in the letter that the corporation of Hove, Sussex, after having had a plant in operation since 1913, are now about to instal three more machines.

NEW INSTALLATIONS OF REFUSE DESTRUCTORS

A number of descriptions of new destructor plants have appeared in these pages during the past twelve months.

Ramsbottom (THE SURVEYOR, January 23, 1914). —In this case the plant consists of two cells on the continuous grate principle, and was designed to deal with 14 tons of refuse in sixteen hours. It was estimated that, after taking into consideration several economies effected, the working of the plant, including repayment of sinking fund and interest, would amount to a trifle under 1d on the rates.

Lincoln. — The erection of a new refuse destructor for this city was commenced in February last. It was designed to deal with 65 tons of refuse per day, and it was estimated that by using the heat generated by the refuse for raising sewage at the adjacent sewage pumping station there would be a saving of £900 a year in the coal bill.

Doncaster (THE SURVEYOR, March 27, 1914).—This new plant consists of four grates arranged as continuous cells. On tests the best result showed that the refuse was being burned at the rate of over 82 tons per twenty-four hours.

Southend-on-Sea (THE SURVEYOR, June 12, 1914).—The refuse destructor plant described in the paper by Mr. E. J. Elford, borough engineer, consists of six cells, and it was estimated that these would provide sufficient steam to pump the dry-weather flow of sewage for five and a-half to six days in each week.

Cleethorpes (THE SURVEYOR, September 25, 1914).—This plant consists of four cells in two units, with a combined capacity of 50 tons per day.

REFUSE DISPOSAL ABROAD

In America there is still a tendency to adopt what is known as garbage reduction plant instead of incinerators. An interesting report upon the refuse disposal of Trenton, N.J., by Messrs. Hering & Gregory, consulting engineers of New York, was published early in 1914, and it was shown that the nett annual operating cost of a reduction plant, including sewage pumping station, would amount to about £14,628, while the figure for an incineration plant would be £9,476. This indicates one reason why the engineers recommended the adoption of the latter method. It was proposed to use the heat from the destructor to generate electricity and to transmit the current to the pumping station at the proposed new sewage disposal works.

From a report upon the disposal of the refuse of Toronto, Canada, it appears that it was considered advisable to deal with the garbage or kitchen refuse separately in a reduction plant, and to burn the rubbish in an incinerator and utilise the power developed in the rubbish furnaces in the reduction plant.

In a report upon the disposal of refuse in Chicago, issued about the same time, somewhat similar recommendations were made. Six different proposals were considered, and the scheme recommended consisted of the disposal of garbage in a central reduction plant, and the burning of rubbish in small incinerators, one in each of fourteen collection districts, except one which is already provided with an incinerator for the total destruction of all garbage and rubbish. It was estimated that in 1920 the enormous amount of over 1,300,000 tons of material will have to be collected and disposed of.

REFUSE DISPOSAL IN LONDON

The difficulty of refuse disposal in large cities is often greater than in smaller towns, owing to the problem of securing suitable sites for destructors and the cost of transport. The very large quantity of refuse to be handled in Chicago is mentioned above. In Manchester it amounted to over 312,000 tons in the year which ended March 31, 1914. In reporting upon the subject at the beginning of the year, the Highways Committee of the Westminster City Council stated that some 115,000 tons of refuse have to be disposed of each year by the council, and the cost of this work is a very heavy item of expense. The committee recommended that, as the question is one which affects all the districts of London, a conference of representatives of the Corporation of London and of the metropolitan borough councils should be convened to consider the whole question.

MAKERS' ACTIVITIES.

During the past twelve months Messrs. Meldrums, Limited, of Timperley, near Manchester, have completed a new four-cell destructor, of their front-feed type, for the North Sydney Council. This destructor works in connection with a Lancashire boiler. They have also shipped to Penang, S.S., an extension to the existing destructor installation, which consists of one of their four-cell, top-feed type of plants. It is fitted with a special carcase-burning chamber, and the contract included the necessary platforms and containing building. The plant is equipped with their simplex patent regenerator, and the air supply is provided by means of Sturtevant fans driven by enclosed engines. The boiler is a Babcock & Wilcox patent water-tube type, of 1,470 sq. ft. heating surface. They have also in hand, subject to the Local Government Board approval, municipal destructors for the Sidmouth,

Finchley and Felixstowe councils. The Sidmouth destructor is to be placed at the gasworks, which will provide a useful outlet for the steam. They are also engaged on a three-cell, front-feed destructor for the Marrickville Council, Sydney. The above-mentioned work is in addition to a large number of destructors of smaller type supplied for hospitals, asylums and sanatoriums.

Messrs. Manlove, Alliott & Co., Limited, of Nottingham, have, during the year 1914, been engaged on the erection of a number of refuse destructors, the most important of which were plants for Cleethorpes, Burton-on-Trent, and Kirkby-in-Ashfield. The Cleethorpes plant, which is now practically completed, consists generally of four "cells" or furnaces arranged in two units, each of two cells on the continuous grate principle. Each unit is complete with a water-tube boiler and combustion chamber, and the cells are all provided with drying hearths, and are arranged for back hand feed. The two boilers—one for each unit—are of the Babcock & Wilcox water-tube type, having a heating surface of 1,186 sq. ft. Forced draught is provided by means of a direct steam-driven fan, and steam jets have also been provided. A striking example of the sound construction and durability of Manlove, Alliott & Co.'s destructor plants is to be found in the fact that the plant they are now erecting at Burton-on-Trent is a reconstruction and extension of their existing plant which was built by them a wash-of a century ago. Incidentally it may be mentioned here that several destructor plants which were built by this firm between thirty-five and forty years ago are still working with satisfactory results. The new plant now in course of erection at Burton-on-Trent consists of four cells, arranged in pairs, on the continuous principle, with combustion chamber and Babcock & Wilcox water-tube boiler, having a heating surface of 735 sq. ft. Forced draught is provided by means of a fan and steam jets. The steam generated from the burning of the refuse will be utilised for electric lighting and for driving a clinker plant, in addition to providing steam for the needs of the destructor itself. The plant at Kirkby-in-Ashfield will consist of two cells, combustion chamber, and Babcock & Wilcox water-tube boiler. The cells are arranged for back hand feed. A fan and steam jets provide forced draught, and an air heater will be included for the purpose of heating the air for forced draught. A large number of smaller furnaces, or "incinerators," have also been supplied during the year to the War Office, the Admiralty, and numerous institutions such as infirmaries, hospitals and asylums.

Messrs. J. & E. Hall, Limited, of London and Dartford, state that during the past year they have supplied many of their lorries to various councils and corporations, including the Sheffield Corporation, two wagons making their fleet of "Hallfords" up to six; and the Kent County Council, six wagons making their fleet of "Hallfords" up to ten. In the case of these two public bodies they have received further repeat orders to replace their fleet of "Hallford" wagons, owing to their former vehicles having been impressed by the War Office for use with the Expeditionary Force. Among other corporations and councils whose "Hallford" wagons have been impressed by the War Office are the county of Southampton and the Wood-bridge Rural District Council, and in each case repeat orders to replace them have been received. The wagons supplied to the various councils are used for a variety of purposes, and it is not possible to indicate those that use them for refuse purposes only. It is now becoming a practice with the various councils to have interchangeable bodies, to enable a single wagon to be used for a variety of purposes, such as street watering, refuse collection, and the cartage of road materials.

The Eagle Engineering Company, Limited, of Warwick, have been fully employed during the past twelve months making both horse-drawn and tractor-drawn wagons for the removal of refuse, and they have also made a number of light steel tipping bodies for motors for the same purpose.

From a general statement of the activities during the past twelvemonth of the Patent Lightning Crusher Company, Limited, it appears that their system of disposal of house refuse has been adopted in Scotland, where the Corporation of Glasgow has erected at their Partick Works a double-unit plant of their patent lightning dust manipulators, and the Urban District Council of St. Andrews, in Fifeshire, has accepted their tender for the erection of a single-unit plant. In the South the Corporation of Hove, Sussex, after a test with one of these machines extending over a period of twelve months, has passed a vote approving of the plant being quadrupled. In the Colonies an offer for the erection of a single-unit in South Africa has been accepted, and a very favourable proposal for the erection of a plant in Australia has been received. These machines have undergone several improvements, and the cost of working has been considerably reduced.

Another branch of the business of this firm in which municipal authorities are interested is being rapidly developed—viz., the reduction of materials for road-making. In this line the Kent County Council has erected one of their machines for the crushing of shingle, the Hornsey Corporation has installed one for the reduction of their destructor clinker for road-making, while the Liverpool Corporation has erected one for a similar purpose, and the County Borough of West Ham has adopted the use of the machine for the reduction of gravel.

Messrs. Hughes & Stirling report that during the past year they have completed the following destructor installations:—

(1) A two-cell, front-fed "Sterling" destructor and Cornish boiler, complete with buildings and chimney, for the Farnborough Urban District Council. This plant supplies steam to the adjoining sewage pumping station.

(2) A three-cell, back fed "Sterling" destructor, with regenerator and B. & W. boiler, 2,030 sq. ft. H.S., with superheater, forced draught and ventilating plant, steam mains and feed pump, for the Pembroke (Dublin) Urban District Council. This plant supplies steam to the electricity works and has given very efficient results.

(3) A two-cell, back fed "Sterling" destructor, with Cornish boiler, complete with buildings and chimney, supplying steam for sewage pumping and disinfecting, for Horsforth Urban District Council.

(4) A two-cell, top-fed destructor of special "Sterling" design, connected to existing large "Sterling" W.T. boiler, to be used for factory power and heating steam at the Diamond Match Works, Liverpool. They are just now completing a plant for the Teddington Urban District Council at the sewage pumping station. The destructor plant comprises two two-cell, front-fed "Sterling" units, together with regenerator and two Lancashire boilers each 20 ft. by 7 ft. 6 in., the steam to be used for sewage pumping. For the Corporation of Widnes the firm have just commenced the erection of a complete installation, comprising a three-grate, back-fed "Sterling" destructor, with Cornish boiler, accessories, buildings and chimney, clinker crusher and screen, mortar mill, and a complete tar-macadam plant.

Important contracts are in hand for the Corporation of Luton and the Royal Borough of Sutton Coldfield. For the former the plant con-

sists of six "Sterling" back-fed cells, with a Babcock & Wilcox boiler, having 1,450 sq. ft. of H.S., with building, flues and accessory machinery. This plant, which will form an extension of the existing plant at the sewage pumping works at Luton, will be of somewhat similar design and arrangement to the plant erected by them for the city of Bath in 1913, which gives great satisfaction. The installation for Sutton Coldfield, abroad, well advanced, is an important one, comprising three "Sterling" back-fed cells, regenerator, Babcock & Wilcox boiler of 1,900 sq. ft. H.S., superheater, accessories, with buildings, chimney, steam main, &c. The site adjoins the borough electricity works, and the steam will be fully utilised for electrical purposes.

Abroad it has not been a busy year, but a complete installation has been completed for the city of Berkeley, California, U.S.A., comprising a three-cell, top-fed "Sterling" destructor, with regenerator and water-tube boiler, with buildings and chimney. Small hoppers above each cell are filled by means of a grab bucket and crane. The hoppers, at normal rate position and discharge their contents into the cell by means of hydraulic rams controlled from the clinkering floor. During the official tests, refuse was burned containing 63 per cent. and 48½ per cent. of moisture, the evaporation per pound of refuse dry-fired being 6 and 1·01 lb. respectively.

For the city of Columbus, Ohio, U.S.A., a two-cell, top-fed "Sterling" destructor is now being erected at the [illegible] station.

SEWERAGE AND SEWAGE DISPOSAL.

In dealing with the subject of sewage disposal in these pages during recent years we seem to remember having made the statement that the problem had been solved in principle, and that future developments would consist mainly of improvements in details. This naturally referred to the biological principle. Readers of this period during the past year, bearing in mind the several new methods of treatment which have come to the front, may consider that our attempt at prophecy has failed; but we think that, up to the present, it is quite correct to state that the new methods of treatment, about which so much has been written during recent months, are actually biological methods, and are merely developments in the application of the biological principle. Disposal by dilution, when properly carried out, is simply the utilisation of bacterial action in thoroughly oxygenated water, the oxygen necessary for the process being taken from the store of dissolved oxygen contained in the water and derived from the atmosphere. Aeration of sewage in tanks, which has been so much discussed during the past few months, is, again, simply a method of augmenting by artificial means the supply of oxygen, and thus accelerating the process of oxidation of the organic impurities. It used to be held by certain experts that some form of anaerobic preliminary treatment, involving putrefaction or septic action, was an essential stage in the process of sewage disposal; but we contended at the time that putrefaction, being the antithesis of purification, ought not to be considered as essential, and that oxidation alone should be the ultimate aim of all efforts to improve the methods of disposal. Since that time we have noted statements to the effect that sewage in a septic condition is less easily purified by filtration than when it is in a fresh state. Further, most improvements in the design of tanks have been in the direction of preventing, or reducing, the extent to which the sewage is subjected to septic action, and the latest developments indicate the possibility of dealing with both sewage and sludge by purely aerobic processes. For these reasons we believe that the improvements in methods of treatment which have been the subject of experimental work and discussion during the past year are in the right direction, and that they will ultimately result in the introduction of methods which will prove not only more efficient but more economical than the systems at present in general use.

DISPOSAL BY DILUTION.

One of the most important events of the past year in connection with sewage disposal was the publication of the final and complete report of the Metropolitan Sewerage Commission of New York. Interim reports had been issued separately from time to time, and were dealt with in these columns, and the chief point we desire to refer to here is that, after the most elaborate and painstaking investigations, the commission were of the opinion that the sewage of New York could be satisfactorily treated by dilution in the waters of the harbour, and in the bay around the harbour, if a certain proportion of the impurities were removed, and that this could be effected by tank treatment alone. From a perusal of the report, it is evident that the discharge for many years past into New York Harbour of the sewage of the city in a crude state resulted in the deposition in the harbour of large quantities of sewage matters in suspension, and that these depleted the water of the harbour of its dissolved oxygen to such an extent that the remainder was insufficient for the oxidation of the organic impurities. Once this state of affairs was reached the conditions of the harbour rapidly became worse and worse, and a little study of the possibilities of such a state of affairs renders it quite easy to comprehend the existing conditions of the harbour as described in the report. The important fact to note is that the conclusions arrived at indicate that if only the solids in suspension were removed, the liquid portion of the sewage could be satisfactorily treated by dilution, without causing a nuisance. The methods to be adopted for the removal of the suspended matters varied from simple grit chambers and screens to complete chemical precipitation, according to the amount of solids to be removed, and naturally the greater the efficiency of the process the greater the amount of sludge to be dealt with.

It may be noted here that in a preliminary report upon the disposal of the sewage of Chicago by a committee of three experts, two of whom were British engineers, it was stated that the minimum requirement should be the removal of the suspended solids by screens and settling basins. Thus it is evident that we were on the safe side when we suggested, in discussing the Eighth Report of the Royal Commission on Sewage Disposal, that it was very unlikely that, even under the best conditions, the discharge of crude sewage would be allowed without some form of preliminary treatment. At the same time, the experience gained from the work of the Royal Commission, as described in the Eighth Report and its Appendix, is being applied in several cases in this country, and there is reason to anticipate that much good work in abating nuisances from the discharge of crude sewage into rivers can be done at the expenditure of much smaller sums than would otherwise have been required.

PRELIMINARY TREATMENT.

The adoption of disposal by dilution under the conditions mentioned above tends to direct the attention of engineers to improved methods of tank treatment, and especially to those types in which the sewage is not allowed to become septic, but is maintained in as fresh a condition as possible. Some engineers are designing tanks on novel lines of their own, but there are several

patented forms of preliminary treatment, which have been described in our pages during the past year. Among these may be mentioned the "Separator," in use at Stone, Staffordshire (*vide* The Surveyor, January 9, 1914), and the "Field-house" tank installed at Leyton, Essex (*vide* The Surveyor, July 3, 1914). Both of these tanks have for their special object the maximum efficiency in the removal of solids in suspension, and this is attained chiefly by great reduction of velocity at the outlets. Incidentally, they also tend to prevent the creation of nuisance from smell by maintaining the sewage in as fresh a condition as possible, but no claim is made for any special advantage in the matter of sludge disposal beyond the provision of exceptional facilities for the removal of sludge.

On the other hand, a third type of tank, the "Imhoff," not only prevents the sewage from becoming septic, but it is claimed that the sludge itself does not produce any unpleasant odours, and is much more easily dried than ordinary sludge. This is stated to be due to the fact that the portion of the tank through which the sewage flows and leaves behind its suspended solids is completely separated from that portion in which the sludge accumulates; and that, under these conditions, the action which takes place in the sludge compartment does not produce the evil-smelling gases which are the usual causes of a nuisance. These tanks have been described in detail on previous occasions, but, so far as we are aware, there are only one or two in operation in this country up to the present. In America, however, as we have pointed out several times, this type of tank has been adopted in many places; we believe that something like one hundred are already in actual use, and are known there as "two-storied" tanks, to distinguish them from ordinary septic, or sedimentation, "one-story" tanks. One of the main features of the "Imhoff" tank is its great depth, varying from 20 ft. to 30 ft., as a rule.

This factor of depths undoubtedly has considerable effect upon the sludge, and may be very largely the cause of the favourable condition for further treatment of the sludge when it is drawn off. This view is supported by the results obtained in experiments with deep tanks, varying from 17 ft. to 30 ft. in depth, which were carried out during 1913 at the Lawrence Experiment Station of the Massachusetts State Board of Health, U.S.A., and described in detail in the forty-fifth annual report of the board. It is there stated that the investigations were "made with sewages of various kinds, and had for their chief object the determination of the physical character and the odour of the sludge when drawn from such tanks after varying periods of storage and decomposition. It was shown by these studies that the deeper the tank, other things being equal, the less the odour of the sludge and the more easily it is handled, drained and dried, owing to improvement in its physical character." It should be noted, however, that in these experiments the deep tanks were filled with sludge taken from other tanks, and further quantities of similar sludge were added to the tanks from time to time; so that, while the process was not exactly the same as in a complete "Imhoff" tank, it is claimed that the conditions were similar, the sludge being subjected to storage and decomposition action under gradually increasing pressure as it worked its way to the bottom of the tank.

In this connection it may be observed that, as the patentee is a German, the question of payment of royalties has already cropped up, and the Board of Trade, in reply to a communication from Messrs. Strachan & Weekes, consulting engineers, of Westminster, have intimated that if any local authority desire to use the apparatus, they should make application under the rules for that purpose, when the board could consider the advisability of suspending the patent in their favour and of fixing such royalty as might be thought reasonable. For our part, we hope by this time next year to have particulars of the results obtained with the "Imhoff" tank which has been constructed at Withington for the Manchester Rivers Department.

Aeration of Sewage.

The developments which have taken place during the past year in this method of treatment are extremely interesting. In our Special Issue of January 30, 1914, we commented upon the earlier experiments carried out by the officials of the Massachusetts State Board of Health by blowing air through sewage contained in a tank fitted with slate slabs placed 1 in. apart, and we then pointed out that it was not clear whether the slabs were placed horizontally or vertically. From a later report it now appears that at first they were used in a horizontal position, but later they were fixed vertically, and thus, as we suggested, may be compared with the "colloidors" in some of the Travis hydrolytic tanks.

These experiments were not the first undertaken in connection with artificial aëration. Some earlier work was referred to in the same special article of January 30, 1914; but the whole history of past investigations into this subject was well summarised by Mr. Edward Ardern, M.Sc., in the paper which he read at the last annual general meeting of the Association of Managers of Sewage Disposal Works (The Surveyor, December 18, 1914). Although most of the experimental work has been on the laboratory scale, it should be noted that the investigations at Salford, as described in the paper by Mr. W. H. Duckworth, F.C.S., which we printed in these pages on December 11th last, were made with about 75,000 gallons of sewage per day, and may thus be considered as on a practical scale. As the results obtained confirmed the results obtained by Mr. Ardern at Manchester, there is no question that the principle has been proved, and it only remains to ascertain the minimum volume of air required to secure efficient results under normal working conditions. This, however, involves much work over a considerable period to arrive at the most suitable form of construction of the tanks themselves and the most efficient method of introducing the air into the sewage in such a manner that it shall not only allow the liquid to take up the maximum amount of oxygen, but that it shall ensure the thorough mixing of the "activated" sludge with the sewage. Indeed, the important part in the process played by the sludge is the most interesting feature of this method of sewage treatment.

It is this which forms such a distinct advance upon our previous knowledge of the subject, and for which we are indebted to the Manchester workers. It now appears that the sludge, which has heretofore always been considered the bugbear of the sewage works manager, is, or will be, actually his best friend, as without the sludge the results recorded could not have been attained. Further, the effect of the thorough aëration which is needed to render the sludge "activated" is such that the final disposal of the residue can be carried out with great ease and without creating a nuisance. If it were not that we now have trustworthy records of results obtained in several places independently, and some on a practical scale, we should be inclined to consider the claims made for this process as extravagant. It is true that we still lack definite details with regard to the cost of operation, but it will be advisable to wait for these until the form of the tanks and the methods of applying the air have been perfected.

Sludge Disposal.

Much work in the improvement of sludge disposal systems has been done in a quiet way during the past year. To our mind the experiments in

connection with the aeration of sewage have given the best promising prospects of a satisfactory solution of this difficult problem. To find the sludge a necessary adjunct of sewage purification, and its disposal thereby rendered much less difficult, was quite unexpected. It is evident that future developments in this direction will proceed in conjunction with those in connection with the aëration of sewage.

Apart from this, reference must be made to the system described by Mr. J. D. Watson, M.Inst.C.E., in his presidential address to the Institute of Sanitary Engineers at the beginning of last year (THE SURVEYOR, January 9, 1914). In this case the addition of yeast to the sludge facilitated the separation of the liquid from the solid portion. Somewhat similar results appear to have been attained by allowing the sludge to decompose at the bottom of deep tanks, as described above under the heading "Preliminary Treatment," reference to which will show that in this instance the sludge was separated from the crude sewage. The same system (of separation) was adopted in dealing with the sludge at Birmingham, as described in the very interesting paper read before the Birmingham section of the Society of Chemical Industry by Mr. F. R. O'Shaughnessy, F.I.C. (THE SURVEYOR, March 6, 1914). It was there shown that the separation and further digestion of the sludge was estimated to reduce the time required for maturing by five or six weeks.

Among the latest processes for the utilisation of sludge is that known as the "S.O.S." system, which has been adopted at Wimbledon recently. The sludge, after being pressed, is subjected to a process of destructive distillation, and the residue, consisting largely of fine carbon, is used in the place of lime for the precipitation of the solids in the sewage. We believe we are correct in saying that it has a value for other purposes as well, and further particulars of the results obtained should be available in due course, and will prove interesting.

THE ROLE OF INSECTS IN SEWAGE DISPOSAL.

In our Special Issue last year we referred to the investigations carried out by Mr. H. D. Bell, manager and chemist at the sewage works of Stratford-on-Avon, with reference to the effect of *Podura* in his filters. At that time we observed that it was not clear whether the insect in question was correctly named. Further information on the subject was published in these pages recently (THE SURVEYOR, December 18, 1914), and it is interesting to note from the particulars supplied by Mr. J. W. Haigh Johnson, B.SC., F.L.S., chemical biologist to the West Riding of Yorkshire Rivers Board, that it does not even belong to the genus *Podura*, but to the closely allied one of *Achorutes*, and that its proper scientific title is *Achorutes viaticus*. The question of its right name may not be considered of great importance to sewage works managers, but it is important to know that it usually feeds upon the slime which develops on the material of sewage filters. This accounts for the improvement which occurred when Mr. Bell placed considerable numbers of this insect on some of his filters at Stratford-on-Avon. We think this information should be made known to all sewage works managers, as it is evident that it would be well worth while for them to collect all the *Achorutes viaticus*, otherwise the tiny bluish-black "maggot" which they notice in effluent channels and chambers, humus tanks, and elsewhere on their works, and carefully place them on the top of their filters, especially on those which are in any way clogged.

CAMP SANITATION.

One effect of the war is seen in the admirable articles under this heading which have been contributed to this journal by Mr. G. B. Hartfree, engineer and surveyor to the Whit. Haunts, Urban District Council. His description of latrines, closets and urinals has undoubtedly been of distinct service to many of our readers who have had to provide accommodation for the large numbers of soldiers who have been in camp during the last few months.

ELECTROLYTIC SEWAGE DISPOSAL.

The utilisation of electricity as a factor in the treatment of sewage has at various times exerted a fascination upon the minds of a number of people who have endeavoured to prove its value in practical application. We have dealt with several attempts in this direction in recent years, and, although the published results have always appeared hopeful, the system has by no means found general application. The latest of these schemes was discussed in these pages recently (THE SURVEYOR, October 16, 1914), and we then stated that we were inclined to agree with the editorial comment of our contemporary *Engineering Record*, from whose pages we obtained a description of the system, that engineers will probably not receive the results of this experiment with quite as much enthusiasm as is contained in the report in question. Since then we have noticed a further discussion in the same journal and a letter from Mr. Earle B. Phelps, Professor of Chemistry in the United States Public Health Service at Washington, in which this eminent expert describes an experiment made in his laboratory with Washington sewage upon exactly similar lines as the above-mentioned system. The nett result was the expression of opinion by Prof. Phelps that "it seems, therefore, that, except for the slight additional advantage of a vigorous mechanical agitation which is a well-known coagulating force, the results of the 'electrolytic' treatment can be accomplished without the electrolytic feature." Further comment is unnecessary.

SUGAR FACTORY WASTES.

In view of the fact that one large sugar factory is already in operation in this country, and others are projected, a description in *Engineering Record*, of October 24th last, of some works specially designed for the disposal of wastes from a sugar factory in California is of interest, and may prove of value to some of our readers. The waste liquids from these factories contain exceptionally large amounts of organic matter, which is apt to become foul rapidly and give off extremely disagreeable odours. The system adopted in the case mentioned consisted of screening by means of a rotary screen and intermittent downward filtration on sand filters. This method is stated to have been entirely satisfactory, and if this type of filter should not be suitable for the conditions in this country it should not be difficult to adapt some type of filter already in general use here. It is fairly evident that everything should be done to prevent the setting up of putrefaction in such liquids, and there would appear to be an opening for experiments with the latest methods of treatment by aëration. Power for providing the necessary volume of air would be always available in such a factory at very little cost, and a further factor in favour of the adoption of such a system is the limited period, three to four months in each year, during which a sugar factory is in operation. It would, however, be necessary to devise some means of producing the required quantity of "activated" sludge in advance, so as to be in a position to put the tanks into proper operation at the commencement of each season, instead of waiting for the "activated" sludge to form in the ordinary way.

DESCRIPTIONS OF WORKS.

The engineer in search of ideas, and the student, will find a perusal of the back numbers of this

journal for the past year particularly fruitful. A large number of excellent descriptions of works carried out, and records of results obtained, have appeared, mostly in the form of papers read at the various meetings of the Institution of Municipal and County Engineers. Among these we may mention descriptions of works at Worcester, Wakefield, Salisbury, Cleethorpes, Leeds and Sheffield. Many features of interest, including suggestions of how *not* to do things, may be found in these papers. Among the latter we may refer to one case at Wilton, mentioned in a paper by Mr. John H. Blizard, ASSOC.M.INST.C.E. (THE SURVEYOR, May 22, 1914). When carrying out the sewerage of Bemerton, near Salisbury Mr. Blizard arranged the sewers in such a manner that the sewage from the adjoining district of Wilton could be taken in by gravitation whenever it was found advisable to do so. Later, when the scheme of sewerage for Wilton was prepared by another engineer, it was decided to pump the sewage into the Bemerton sewers, in spite of the fact that Mr. Blizard pointed out at the Local Government Board inquiry that it could be discharged by gravitation. The scheme was, however, duly approved by the Local Government Board, and for several years the sewage of Wilton was pumped until some trouble arose from an excessive amount of leakage into the sewers. It then occurred to somebody that Mr. Blizard may have been right after all, and eventually he was instructed to deal with the matter, with the result that the sewage is now gravitating to Bemerton and the pumps are not required.

Among the papers referred to above there were two of exceptional interest and value which formed the subject-matter of two special supplements (THE SURVEYOR, February 27, and June 12, 1914). The first of these, by Mr. T. de Courcy Meade, M.INST.C.E., city surveyor of Manchester, described in detail, with numerous illustrations, "Twenty Years' Work in a Great City." The major portion of the paper was devoted to the new main drainage works then in course of construction, and the most interesting part was probably that which dealt with the defects observed, after careful inspection, in the work previously carried out, and the methods adopted to make good those defects and to prevent their recurrence in the future.

The second of these two special supplements was a description by Mr. E. J. Elford, M.INST.C.E., borough engineer of Southend-on-Sea, describing and illustrating the new main sewerage and sewage disposal works constructed for that town. In these works the special methods adopted in the construction of the two intercepting sewers, and the system of jointing the concrete tubes of which they were formed, are of exceptional interest. Other novel features of the scheme were the adoption of two Humphrey pumps, each capable of raising 198,000 gallons per hour against a head of 68 ft. for dealing with the storm water, and the use of a Stereophagus pump for the removal of accumulations of deposit from the invert of the pump well.

STANDARDISATION OF ANALYTICAL METHODS.

The lack of uniformity in the tests used in different sewage works is very unsatisfactory, as comparisons between the results obtained are apt to be misleading. An effort to remedy this defect is being made in America, and an elaborate report upon "Sewage Works Operation and Analytical Methods" has been prepared by a committee appointed for the purpose by the sanitary engineering section of the American Public Health Association. This report appeared in our issue of January 1st, and we hope that the appeal for co-operation by communicating their views will find a ready response from our engineers, chemists, biologists, and sewage works managers. We already derive much benefit from the many admirably presented records of sewage works operation published in America, and anything that can be done in this country to assist in making all tests uniform would be of considerable value to workers in both countries.

REVENUE FROM SEWAGE DISPOSAL.

There are few places where any income is derived from sewage, and among these Bradford, Yorks, probably stands easily first. Although the total cost of disposal in 1913 was £89,000, the sale of grease alone brought in £48,000, while the sludge residue, after the removal of the grease, was sold in large quantities as manure, being sent to France, Belgium, Florida, and even as far as India to tea gardens on the slopes of the Himalayas. The revenue derived from the sale of these by-products more than covers the cost of operation, so that, apart from capital charges, the sewage disposal works are self-supporting.

STREET LIGHTING.

Undoubtedly the feature which above all others marks out 1914 from its predecessors in connection with street lighting is that which is aptly conveyed by the ancient pseudo-paradox, *lucem a non lucendo*. Never before, since the modern art of street lighting was developed, have the streets in the eastern and some other British towns been reduced to so low a level of illumination the minimum compatible with a moderate degree of safety to traffic. The chief object of this has been to diminish the illumination of the sky by the light reflected from the ground, in order to facilitate the detection of hostile aeroplanes, and therefore the lighting of shop windows—which contributes no mean portion of the street lighting in business quarters—has also been cut down by order of the Government. Another purpose has been to render it difficult for enemy aircraft to recognise their whereabouts by the relative widths of the main roads, and for this reason in many cases the lamps have been lighted only on one side of the roadway. Various methods have been adopted in order to meet the requirements, such as lighting only a few of the street lamps, painting the upper and sometimes the lower portions of the globes, installing lights of lower candle-power, and so forth. The effect, in the opinion of some observers, has not always been a change for the worse: in particular, the abolition of the glaring outside lamps used by many shopkeepers has been an unmixed gain to the general public, and tradesmen have perforce learnt better ways of illuminating their shop windows than that of filling them with unscreened glaring lamps. But the dangers of the streets are undoubtedly greatly increased, and had it not happened that very many of the motor-'buses had been requisitioned for the front, as well as many private cars, the death-roll in London, at any rate, would have been abnormal.

SHORTAGE OF SUPPLIES.

Another way in which the war has affected street lighting is by cutting off the foreign supplies of gas mantles and arc-lamp carbons, the great bulk of which were imported from the Continent in peace time. Fortunately, considerable stocks were held in this country, and manufacturers of mantles will be able to meet the conditions, provided they can obtain an adequate supply of the rare earths necessary for their purpose. One carbon works, patriotically maintained for many years at a heavy loss, immediately experienced a torrent of rush orders, which had to give place to urgent Government demands. The scarcity of carbons has certainly restricted arc lighting in many cases, and in some

instances has led to the substitution of high candle-power incandescent electric lamps for arc lamps.

NEW LAMPS.

It so happened that the new half-watt lamp (which is described in our special article on Electricity Supply), which was put on the market in January, was admirably adapted to replace the arc lamp, and it has been installed by many street lighting authorities. No doubt its adoption has been appreciably accelerated by the stringency in the market for carbons. Its efficiency is not greater than that of the flame arc, but it has the advantage of requiring practically no attention. The cost of renewals is somewhat greater than the cost of carbons for trimming flame arc lamps, and apparently the latter is still the cheaper on the whole; but the life of the half-watt lamp is the determining factor, and this is not yet very precisely known. The guaranteed life was 1,000 hours, but in practice a life of 1,500 hours is said to be attained, and as the methods of manufacture improve, still longer lives may be expected, as well as a reduced first cost. The prospects are decidedly favourable to the newcomer.

The gas engineers also had a new lamp before them last year—namely, the Keith high-pressure silica lamp. This has been in course of development for some years, in the face of extraordinary difficulties, but in October, 1913, it was publicly demonstrated for the first time. Fresh difficulties cropped up, and the introduction of the lamp was further delayed, but in April last year Mr. George Keith announced at a meeting of gas engineers that the troubles had been overcome. The essential feature of the new lamp is the substitution of a small fused silica cup for the large glass globe, enclosing the mantle in a small chamber. The cup becomes red-hot, but suffers no injury—on the contrary, the high temperature burns off dirt which may be deposited on it, and cleaning is much less frequently required. One of the principal advantages of the device is the lessened cost of maintenance; the occurrence of a hole in the mantle does not necessitate an immediate renewal. The small size of the cup also gives greater latitude in the design of the lamp and reflector, and the efficiency of the lamp is higher than that of the ordinary high-pressure type, while the maintenance cost is said to be about half as much.

[illegible]

The reduction of illumination has naturally had the effect of shutting down for the time high-pressure gas lighting in many places, and thus retarding the development of this branch of industry. It has also raised the question how the existing contracts for gas and electric lighting are to be dealt with. This, however, is being settled by agreement in a friendly spirit between the municipalities and companies concerned. The contractors for gas lighting are making reductions corresponding to the saving in gas, but point out that the cost of maintenance of the plant is not materially diminished, and therefore no allowance will be made on this score. The new scheme for lighting the City of London with gas and electricity in approximately equal proportions has been practically completed. In Manchester the electric lighting is being extended [illegible] miles of streets being included in the scheme; flame arcs will be used for the most part, but a proportion of half-watt lamps will be installed. The central suspension system is gaining in popularity. The Joint Committee of members of the Illuminating Engineering Society and the Institutions of Gas and Electrical Engineers which was appointed to draw up a model specification for street lighting, but came to a deadlock, is still considering the subject, and has not yet solved the problem.

TRAMWAYS.

The history of municipal tramways during the past year has not been marked by any very striking events. Good progress has been made, and with certain exceptions the returns have been highly satisfactory. The effect of the outbreak of war, however, has made itself felt towards the close of the year in the shape of reduced traffic receipts, and a number of extensions and new tramway construction schemes have been held up for the time being. There has not been manifested the slightest justification for the agitation from time to time worked up by certain newspapers against municipal tramways, on the fallacious ground that they are being superseded by the self-contained motor vehicle, in point of fact, nowhere except in London is there even a plausible basis for such a contention, and the conditions which obtain in the Metropolitan area are unique in the world. In the provinces the larger undertakings, and most of the smaller ones, have shown a satisfactory credit balance after making all allowances, and in some cases a very large surplus has been recorded.

METROPOLITAN TRAMWAYS.

Unfortunately, in the Metropolitan area the severity of the competition of the motor-omnibuses has had a disastrous effect upon the financial condition of the municipal tramways concerned. The huge system of the County Council, embracing over 148 miles of streets, showed a deficit of no less than £88,526 for the year ending March 31st, which had to be made good from the reserve fund, reducing the latter to £190,597, and no addition could be made to the renewals fund, which stands at £539,749. The tramways, of course, are heavily handicapped in the competition by the special statutory burdens imposed upon them and not upon the omnibus companies, [illegible] to which London is exposed, and the tramways in the great cities have been thriving; the problem, indeed, has been how to carry the [illegible] traffic [illegible] and [illegible] the [illegible] and [illegible] the [illegible] [illegible] into the country. The County Council estimates that, [illegible] the public [illegible] to the extent of £11 [illegible] per £100 of gross receipts of the tramways, the omnibuses contribute only £2 6s. If the latter were called upon to pay ¾d. per 'bus-mile for the road repairs necessitated by their heavy traffic, their contribution to the public funds would be increased to £7 per £100 of gross receipts, and the margin of receipt over expenses would be reduced from 0·38d. to 0·1d. per 'bus-mile. Moreover, the carrying capacity of the tramcars during the busy hours is far greater than that of the omnibuses, and the former provide protection from the weather. Fortunately for the tramways, on the outbreak of war an enormous number of motor-omnibuses was requisitioned by the Government for service at the Front, and heavy drafts have since been made upon them, while the whole output of the omnibus company's workshops is absorbed by the War Office, so that the tramways at present have an opportunity of repairing their losses. The council is seeking powers to expend nearly £250,000 sterling on tramway works.

PROVINCIAL TRAMWAYS.

The provincial towns are free from the competition

traffic that is offered a question which has reached an acute stage in Manchester and Liverpool, owing to the extreme congestion in the central areas. Manchester Corporation Tramways brought in a revenue of £925,310, and a net profit of £200,000, of which one-half was allotted to the rates. Over 200,000,000 passengers were carried, and a profit was made on the carriage of parcels. A new car with front exit has been introduced. Drastic measures are urgently necessary to cope with the traffic, and though the authorities hesitate to open the question of underground subways, it is stated by Mr. McElroy, the general manager, that rapid-transit facilities will have to be provided in the near future. A similar situation obtains in Liverpool, and the general manager, Mr. Mallins, who has introduced improved and larger types of car, proposes that a tunnel should be constructed under the river. A committee of the corporation was appointed in January to consider the question. Further proposals put forward by Mr. Mallins embrace the construction of tube railways aggregating 11 miles, and costing £5,500,000 sterling, the complete scheme involving the co-ordination of the whole of the existing transport systems on both sides of the river Mersey. The tramways carried 144,000,000 passengers, and contributed £100,000 to the rates, a record figure. The reserve fund was raised to more than £750,000 sterling. A proposal to undertake goods traffic from the docks was seriously considered, but would involve the contruction of new lines, as the existing tramways are utilised to the utmost.

Glasgow had a successful year, and was able to allot £53,892 to the "common good." Owing to the high charges of the insurance companies, the corporation has resolved to provide its own insurance fund against third-party risks, and is setting aside £31,000 a year for this purpose. The city holds a lease of the harbour tunnels, and proposes to run tramways through them to relieve the traffic over the bridges. A new type of car with front exit is under trial. The tramways carried 336,000,000 passengers, of whom no fewer than 211,000,000 paid halfpenny fares. Birmingham resolved upon extensions to cost £128,240, and experimented with first-class cars, which proved a failure. Bristol Corporation decided to promote a Bill to enable it to purchase the tramways, the option maturing in 1915. The cost will probably be £1,250,000 sterling. The Newcastle Corporation distinguished itself by allocating £18,000 to the rates, and borrowing £12,240 for new cars. Leeds paid £70,000 to the rates. Sheffield carried 105,000,000 passengers, and contributed over £30,000 to the rates. At Hastings the surface-contact system on the front, which has been giving trouble for years, was finally condemned by the Board of Trade, and as the corporation will not permit the overhead system to be used on this section, Stevens petrol-electric tramcars were adopted. These change over to the trolley system at the boundary of the section. There are now only two surface-contact systems in operation in this country—namely, at Wolverhampton and Lincoln. A curious situation arose at Chester over the purchase of the Colne and Trawden Light Railways by the corporation. The company asked for £85,000, the council offered £45,000, and the matter went to arbitration, when the respective figures put forward were £170,000 and £27,000. The arbitrator, who was not informed about the lower figures, awarded the company £92,830. Edinburgh and Halifax are each proposing to spend over £160,000 on tramway construction.

RAILLESS ELECTRIC TRACTION AND MOTOR 'BUSES.

The popularity of the railless system seems to be increasing. Extensions were carried out by the Bradford, Keighley, Leeds, York, and Reading Councils, new schemes were adopted at Walsall, Aberdare, and Nelson, and one was inaugurated at Ramsbottom. Remarkably low working costs have been published. Brighton and Hove are still arguing about the system to adopt for their joint scheme. Brighton wants an underrunning system on account of the trolley tramways, while Hove prefers the over-running type, and has had a mile of roadway equipped on that system for demonstration purposes. Apparently the question will have to be settled by arbitration. A good deal of attention is also being given to motor omnibuses by municipal tramway managers as feeders to their systems. Edinburgh tried six, but gave up the experiment after incurring a considerable loss. Sheffield, however, obtained a revenue of £9,128 from motor 'buses, and recorded a surplus of £1,271. At Halifax a loss was shown. Birmingham, Oldham, Rotherham, Warrington, and Wolverhampton are also using motor omnibuses. Southend, York, and South Shields are trying Edison electric battery 'buses—a fact which carries us back to old times, for the attempts to run battery 'buses and tramcars were many and various some twenty years ago—and costly too. But the modern electric 'bus is very different from its ancient forerunner, and as a matter of fact the Brighton Corporation has had a number of them in use for some time. Coventry's 'buses were carried off by the War Office. At Oxford the corporation has maintained for years a controversy with the local tramway company, which wished to convert its horse tramways to the trolley system, while the council demanded the conduit or surface contacts. The knot has been cut by the council's agreeing to a Bill promoted by the company, by which the latter is authorised to run motor 'buses. Birmingham Corporation has been contemplating the purchase of the whole of the plant of the Birmingham and Midland Motor Omnibus Company for £34,000.

ELECTRIC AUTOMOBILES.

We have already mentioned some instances of the use of electric battery vehicles by municipalities. A strong impetus was given to this movement by the formation of the Electric Vehicle Committee of the Incorporated Municipal Electrical Association in 1913, and during the past year the committee has been actively engaged in forwarding it, mainly in the interests of electricity supply. The movement, however, affects the traction and other departments also, and may fitly be included under this heading. The committee rightly began by organising facilities for charging the batteries of electric vehicles, and continued this policy by specifying standards for charging plugs, voltages, and so forth. It also urged municipal departments to use these vehicles whenever possible, and battery vans have been obtained for refuse collection by the Corporations of Glasgow, Birmingham, and Marylebone. Electric tower wagons have been purchased by Ilford Urban District Council and Belfast City Council for work on the trolley wires, and the London Fire Brigade has fifteen "electrics" in use as escape vans and motor turntable ladders, as well as some petrol-electric vehicles.

The requisitioning of petrol vehicles by the War Office naturally sent up the demand for electric vehicles, and there is certainly a bright future before them. Fifteen municipalities are using them, and a large number of electricity works have made arrangements for charging the batteries. The committee is endeavouring to induce all suppliers to make a uniform price of 1d. a unit for charging, at times other than during the "peak" load. Users generally report very favourably as to their reliability and economy in

comparison with either horse-drawn or petrol vehicles.

MISCELLANEOUS ITEMS.

The "Pay-as-you-enter" principle, at first thought to be unsuitable for conditions in this country, has established itself in several towns. Aberdeen, in particular, has found it very satisfactory, and Blackpool has recently adopted it for top-deck passengers, the advantage being that the conductor need not leave the lower deck. Passenger meters are being tried for top-deck passengers at Sheffield. A universal penny fare has proved satisfactory at South Shields, but this, of course, is only possible where the system is not of an extended character.

The London County Council was recommended by the General Purposes Committee to concur in the view of the Select Committee on Motor Traffic—that in all Metropolitan traffic questions Parliament should be advised by a special traffic department, combining the duties of the various existing authorities that deal with this subject. The Municipal Tramways Association also adopted this policy. The position of motor-omnibus traffic with regard to the maintenance of roads was further considered by Parliament, and a charge of ⅜d. per 'bus-mile was imposed in connection with several Bills, so that it would seem that the principle of making the omnibus companies pay for the use of the roads has been definitely adopted, though it has not received universal application. It necessarily reacts upon railless trolley systems, which are subject to the same payment.

The subject of rail-corrugation was discussed by Mr. S. Sellon in a paper read before the Institution of Civil Engineers in February, when the author ascribed the trouble to the use of steel not hard enough or tough enough for its work. It will be remarked that this was the view supported by THE SURVEYOR in 1907.

A remarkable paper on "Town Planning in Relation to Tramways" was read by Mr. J. A. Brodie, city engineer of Liverpool, before the Tramway Congress. The author advocated a more liberal policy in laying out new and important roads, suggesting a minimum width of 80 ft. for any main thoroughfare leading to the centre of the town, and 120 ft. if possible. Having the courage of his convictions, the author had constructed such roads in Liverpool, with the tramways in the middle. High speeds he regarded as essential to the success of tramways in the future, and these could be attained by separating the tramway from the roadway, while the cost of the 120-ft. road and a tramway laid on sleepers was not greater than that of the 80-ft. road with a paved tramway track. He thought that by this means the construction of subways or tubes could be avoided. It is evident that in the north the evolution of the tramway is not regarded as having reached finality, and that the managers and engineers have undiminished faith in its future.

WATER SUPPLY.

In almost every branch it will be found that water engineering practice has changed materially during the last few years, and that the methods which were generally accepted at the end of the last century have been altered beyond all recognition. During the past year much progress has been made, and the object of the present review will be to indicate some of the changes taking place rather than to describe or enumerate the works constructed or designed during that period.

Whether we consider sources of supply, methods of storage, pumping, purification, distribution, or general construction, we note great changes due to altered conditions, to the advance of knowledge, and last, but not least, to the energy and enterprise of the engineer. Who, a few years ago, would have taken into account in designing a waterworks that water can be lifted against a head of 1,800 ft. by centrifugal pumps, or would have had any conception of an appliance such as the Humphrey pump? What manufacturer twelve months ago could have hoped to have been suddenly free from the powerful German competition? Possibly the increased use of reinforced concrete, the improvements in internal combustion engines, the economy to be effected by the prevention of waste and leakages, the enormous increase in the use of steel water-mains, the combination of districts, or the increased use of water power and electricity might have been anticipated by thoughtful men; but it is improbable that any one could have foretold even a few years ago the extraordinary progress in methods of construction, the rapidity with which great works can now be carried out, and the manner in which works of water supply are being carried out in all parts of the world; neither is it possible for us to foresee the results of the work which is at present going forward. One thing, however, is evident—that in such a time of change and progress it is necessary to learn daily what is taking place around us.

SOURCES OF SUPPLY.

Although the principle of obtaining the purest water possible still holds good, the modern tendency, speaking generally, is to obtain water from the natural source of supply to the district without going further afield than is absolutely necessary. We see the adoption of this principle chiefly abroad, but we are not without important examples in this country. The instance of London has been so often referred to in these pages that it is unnecessary to do more than mention it. We drew attention in the early part of the year to the fact that the Coventry City Council had adopted proposals for reclaiming the Whitley Waterworks, which had been out of use for five years owing to the water being polluted. It was then proposed to sterilise this polluted water, it being estimated that an annual saving of £3,285 would thereby be effected. It would be possible to mention a number of other instances where a similar policy has been adopted. On the other hand, owing to the lack of knowledge among the general public, it is generally impolitic to lay too much stress upon the character of the raw water. There are, however, in this country a large number of supplies which in their raw condition would be quite unsuitable for drinking purposes, and the fact that they are being treated and made fit for human consumption renders such waters safer than purer waters would be, only that such waters may easily be subjected to accidental contamination, and if thus polluted would receive no purification at the works.

Undoubtedly, the safest supply is the purified supply. Neither must it be imagined that the water which is obtained at great cost from upland gathering grounds may not, under certain conditions, give serious trouble. We had such an instance in the past year in the case of Nottingham, where a very serious state of affairs arose in connection with the Derwent Valley supply. Almost at the start there were complaints as to the colour and taste of the water, and the Nottingham City Water Committee reported to the effect that if the supply from the Derwent Valley works was to be continued the whole of the wrought-iron pipes, cylinders and boilers then in use for hot water domestic supplies would have to be replaced by lead and copper piping and fittings. It appeared that the water at that time was of such a quality that, though pure enough from the health point of view, it was likely to be extremely troublesome. It will be remembered that some years ago Sheffield had the same experience. Such instances as Nottingham go to

prove that the advantages of going far afield for water are not always as great as is supposed.

There are various reasons why such water often has to be treated. Again, in many places it is impossible to obtain a perfectly pure supply without treatment. All over the world it is certainly becoming the general practice to use the supply nearest at hand, and although much money will undoubtedly still be spent on long pipe lines, reservoirs and so forth in order to obtain a supply of exceptional purity, more elaborate purification works will in many cases, probably in the majority of cases, act as an efficient substitute.

WATER TREATMENT.

"River and Canal Water Purified for Town Supplies and Industrial Purposes" is the heading of an advertisement issued by one of the great manufacturers of water purification plant. Gradually even the layman must be realising that a great change has come over our water engineering. It cannot be said that the science of water treatment has reached its final stage. It is possible to obtain results required by various methods, but, though we are still in the interesting period of rapid advancement, when methods of all kinds are on trial, and wherein all concerned find ample outlets for their energy and fresh problems upon which to employ their best united efforts, we have at any rate reached the stage when great economy and absolute safety are to be obtained by the adoption of new methods.

In reviewing the work of water treatment, therefore, it is clear that we have to deal with many different methods, all of which are finding useful application at the present time.

Purification by storage is best exemplified by the works of the Metropolitan Water Board. This process is at work, recognised or unrecognised, in many other places. Occasionally the principle is advocated for new schemes, but from its nature it can only be adopted under certain conditions. The changes effected by storage depend entirely upon the character of the water. A good water from upland sources, deep wells, or springs will not improve by storage; on the contrary, such storage is liable to cause deterioration; but for waters derived from rivers or shallow wells containing organisms storage has been found to be useful for the reason that, as shown by experiment, pathogenic germs tend to disappear. There are, however, various possibilities of trouble and a certainty of expense which limit the usefulness of that method.

Aëration, being useful in removing or lessening odours and colours, for the oxidation of iron in solution, or of nitrogenous matters, is a process which forms a very important step in the purification of water at most of our large works at the present time. It is generally admittedly desirable. Another process, possibly the most important part of the majority of methods of water treatment, is sedimentation, either natural or assisted. We find that by the addition of various chemicals changes of many kinds are effected and a deposit results, as for instance in the case where lime solution is added to hard water.

To review the many processes in which this occurs is unnecessary, and it will be sufficient to state that it is in such chemical treatment of the water that some of the chief advances made during recent years are due, and that the work of the past year shows various new applications of the process. Natural sedimentation is also largely used. It certainly forms an important part in the method of purification by storage, while it may be said to be the principle upon which the roughing or preliminary filter is based, the chief application of which is to be seen in the Puech Chabal system, which is in use at Sunbury-on-Thames, Bamford, Derbyshire, and at very many other places which have been mentioned from time to time in these pages. The extensive use of the Puech Chabal filter is one of the noteworthy features of the present time, its principle being multiple filtration. Settlement and coagulation, speaking generally, do not form a complete purification system because the length of time required for the water to be cleared in this manner is too great; thus the process is generally used as a preliminary to filtration. In the science of filtration there have been great developments.

FILTRATION.

It is not very long since the open sand filter was the chief means of water purification throughout the world, and although it has been superseded at a great many places by the mechanical filter, it is still one of the chief methods. The greater economy of using mechanical filters is, however, evident. In a country like England, where land is valuable, the advantages are peculiarly great; thus the use of mechanical filters, combined with apparatus for adding suitable chemical solutions, has steadily advanced. Installations dealing with the largest supplies in this country and abroad have been noted from time to time in these pages, and it will be seen from information given elsewhere as to a number of plants of this description installed during the year 1914 that there can be no doubt as to the universal acceptance of the mechanical filter. Further, it may be said that the method includes the treatment of all waters to any required degree. The removal of discoloration, iron acidity, plumbo-solvency, and corrosive qualities may be ensured. The cost of construction, upkeep, and the area of the works are reduced to a minimum. The rate of filtration is higher, better control is afforded, contamination is prevented, and the irregularities of working common to all slow sand filters are avoided. Hence it is not at all surprising that the mechanical filter bids fair in time to supersede the slow sand filter entirely.

GREAT INSTALLATIONS OF MECHANICAL FILTERS.

Probably the most important installation of mechanical filters during the past year is that of St. Louis, where a plant capable of treating 160,000,000 gallons a day has been under construction. At Baltimore there is an installation with a capacity of 128,000,000 gallons per day. In this country we have already seen towns such as Sheffield and Huddersfield adopting the system, and it is noteworthy that at Huddersfield a further extension of the works has been made during the past year by the addition of more mechanical filters capable of dealing with 4,500,000 gallons of water per day, while filters to deal with another 1,200,000 gallons of water per day are on order at the present time. His Majesty the King opened new works at Clydebank in July, which works include mechanical filters capable of dealing with 6,000,000 gallons a day. It should be noted that these filters have superseded the old slow sand filters, which have now been converted into storage reservoirs. The Irvine and District Water Board have ordered similar filters to deal with 5,500,000 gallons per day, which again will supersede the slow sand filters.

A very large number of similar instances, each of them possessing special features of great interest, could be quoted. Some typical examples are given elsewhere in these pages. The adoption of mechanical filters on this large scale is entirely due to the good results produced first at small installations, later at innumerable installations, both small and large, and finally at installations dealing with supplies of the first magnitude. Among other facts of interest it is to be noted that the War Office has adopted the mechanical filter for the treatment of water supplied to our soldiers in various camps.

[illegible] TREATMENT.

One thing is becoming more and more evident—namely, that as the raw water drawn from a river or storage reservoir varies in quality from time to time, so must its treatment also vary. Dr. Houston has drawn attention to this fact in the case of London in relation to the bad quality of the water

entering the reservoirs when floods follow a dry period. With the modern filter by a simple provision of settling tanks and mixing channels such preliminary treatment as is required can be given, and the treatment may be modified to any required extent, or if the water be sufficiently pure no chemicals need be used at all.

At most, if not all, of the new works provision is also made for the application of a sterilising agent to the water. Greater care is also being given to the manner in which coagulants and chemicals are added to the water. At St. Louis it is estimated that a saving of 30 per cent of the chemicals will be effected merely by allowing a long period for the softening action of the lime before sulphate of iron is added, thus avoiding the loss due to chemical reactions.

The form of the filters at these large works naturally differs from that of the filters used at smaller works. We find that reinforced concrete tanks, say 50 ft. by 50 ft. in plan, are built, and these contain about 30 in. of sand; but they differ from the old sand filter in the fact that there are facilities for regular and perfect mechanical cleaning, that the sand is of finer grade, and that the filters work under a greater pressure. A great deal of work has been done in devising methods for perfect and regular cleaning. As already stated provision is generally made so that the water can be sterilised after filtration if required.

[illegible]

With regard to sterilisation, the work of the past year does not appear to show any particular advance with regard to ozone sterilisation, and we have heard comparatively little of the ultra-violet rays.

With regard to the use of ultra-violet rays for water sterilisation it seems that the most important event of the year was the adoption of the method by the city of Niagara Falls, New York. As reported in the *Canadian Engineer* a contract was awarded to the R.U.V. Company of New York for the installation of thirty-five "pistol" lamps for the sterilisation of the city supply by means of the ultra-violet rays of the mercury vapour quartz lamp. This event was of particular importance as being the first municipal installation of the system in America. Moreover, this is a very large installation, the capacity of the filters in connection with which the lamps are to be used being 10,000,000 gallons per day. The lamps are to operate in banks of seven, and are to be spaced 30 in. apart. Each bank will rest on a concrete channel 2 ft. wide by 3 ft. deep by 26 ft. long, and the water will pass through the channel at a rate that will allow an exposure of thirty seconds to the ultra-violet rays. The cost of the installation is stated to be £4,120.

It is a distinct advantage in this system that the degree of treatment can be varied according to the quality of the water by having more or fewer lamps in operation at one time. Judging from the results at Marommes les Rimen in France and elsewhere it seems also that a much higher speed of preliminary filtration is possible than would be required for the treatment of the same water without subsequent sterilisation. Provided that the water is rendered free from all small, visible suspended matter, the rays will deal with the micro-organisms. Interesting as the description of the Niagara Falls installation may be, and encouraging as it must also be to the advocates of the ultra-violet rays system, we hear little concerning its adoption elsewhere. Probably a great deal will depend upon the success of this trial.

It is not to be doubted that the ozone process, which possesses many advantages, would have been largely adopted in America but for the historic failure at St. Louis, the direct result of which was that America gave its full attention to hypochlorite treatment of water with the splendid results which are now a matter of common knowledge.

HYPOCHLORITE STERILISATION AT HOME.

In this country sterilisation by means of hypochlorite has been very largely adopted, but, owing probably to popular prejudice, very little has been said about it. Neither have we worked upon the American lines, for, whereas in America each engineer and chemist designed his own system and plant—sometimes with results rather trying to the consumer—in this country the matter has rested generally in the hands of a few experts and with manufacturers of special apparatus, who have done excellent work in this respect, and have shown great enterprise and skill in perfecting sterilising plant, and also in its installation. Where the water is treated in this country we hear very little about it, and this is the best possible proof of the satisfactory nature of the system.

It cannot be doubted that the good health statistics of our armies both at home and abroad are due to the care exercised in the matter of water supply. Where large bodies of men are suddenly gathered together in camps, time does not permit of the construction of waterworks. The hardships of the soldiers would have been greatly increased, and enteric might have claimed a host of victims, were it not for the fact that the authorities are able to procure at short notice plant capable of treating the worst water and rendering it not only safe for drinking purposes but of the best possible quality. In this alone we may feel a debt of gratitude to those workers who have discovered the means for [illegible]

In America the sterilisation of water by means of chlorine gas, a method which has been much criticised by chemists, is certainly gaining ground. This process has been adopted for the final purification of the water supply of Baltimore, and it certainly claims our serious attention.

[illegible]

The general adoption of hypochlorite [illegible] water sterilisation has been discussed many times in these pages, and it is unnecessary to say much more about it. It is interesting to note that at Paris, where the ozone treatment of the water has been so much in evidence, hypochlorite treatment is used for the emergency supply which is required in the summer owing to the original provision of water being short by about 100,000 cubic metres a day at such times. When this occurs the reservoirs are depleted and an emergency reservoir is instituted for the use of the Marne water, which is filtered rapidly and sterilised by means of hypochlorite.

Statistics from America show that, taking eight cities where hypochlorite treatment has been adopted for comparison, there was a reduction of 72 per cent in the typhoid death-rate as a maximum in Cleveland and a reduction of 35 per cent as a minimum at Baltimore, the average reduction in the typhoid fever rate in the eight cities after the use of hypochlorite being 51 per cent. These figures show that a number of valuable lives have been saved; but what has been the saving in the number of cases of sickness! It is only reasonable to assume that for each life saved there were several cases of sickness prevented, and if to this were added the number of persons saved from sorrow and suffering by the death or illness of friends or relations, it will be seen that many persons living in those eight cities owe a lasting debt of gratitude to those who removed the typhoid germs from the water. Moreover, it is highly probable that other disease germs are removed by sterilisation. Typhoid and cholera germs we know, but all evidence points to the fact that there are other germs more or less harmful in polluted water which are destroyed by sterilisation. In the past year it has been shown that goitre is caused in this way, and that sterilisation will prevent it. More and more clear does it become that the b. coli are a danger-signal.

We also have had the report of Dr. H. R. Gaylord to the United States Bureau of Fisheries before us. His investigations tend to show that cancer is a water-borne disease. Certainly we have

as yet heard no more of it. However, in spite of theory, it has been observed that a pure water supply results in a decrease of many diseases which are not supposed to be water-borne.

LIME TREATMENT AND STERILISATION.

The interest taken in the question of the softening of water supplies has greatly increased, and is reflected by the large number of water-softening plants which have been laid down within a comparatively short period to treat both public and private water supplies.

The results obtained by Dr. Houston in the sterilisation of water supplies by means of lime have redirected attention to the great advantages of lime softening. From Dr. Houston's results it is gathered that the practical value of lime in the purification of water is greater than has generally been considered.

The lime process is certain and rapid in its action, easily applied, and inexpensive to carry out; while the installation of the necessary mechanical plant for adding the lime to the water for both bactericidal and softening purposes is well within the means of even the smallest water authorities, whom it enables not only to secure a high degree of purity in their water supplies, but also to increase the available sources of supply by the utilisation of flood water and so forth, which can be rendered perfectly pure and potable by the lime process.

The question of wholly or partially softening public water supplies is one which it is easier for a small public authority to deal with than a large corporation, as the cost of the treatment is in direct ratio to the quantity of water supplied. On this account the smaller water authorities have shown more activity in the installation of softening plants than the water authorities of the larger towns.

LEAD POISONING.

In a report to the Local Government Board on the occurrence of lead poisoning at Guisborough it will be remembered that Dr. Frank Symons found that, though lime treatment had been carried out to counteract acidity, this particular water produced more cases of lead poisoning after than before the treatment was applied. This was apparently due to the "erosive" ability of the water as distinguished from its solvent ability. In relation to this quality Dr. Houston had already pointed out that the lime treatment is seldom perfectly satisfactory as regards the removal of acidity, and that such treatment "seems actually to render the water more prone to erode lead." It seems that the chemical and physical conditions which favour erosion are not yet fully understood. Here, then, is a fresh field of research for the chemist, and a very strong reason against the use of lead pipes. It will be found in the most recent treatises upon the subject that the risks of using lead pipes and cisterns are much greater than is commonly supposed. It is true that they may be used safely with certain waters, but in the case of any new or doubtful supply lead pipes certainly ought not to be used until the chemist has made sufficient trials or tests of the water to enable him to take responsibility for its use with lead pipes.

EFFECT OF THE WAR.

The influence of the war upon trade may be gathered from the publications issued recently by the Commercial Intelligence Branch of the Board of Trade. It is to be gathered, for instance, that the total exports of Germany as regards pumps and pumping machinery are nearly as large as those of this country, great trade being done with France and Russia. Having regard to Russia in particular, it is evident that there should be a great opening for British trade. The German imports into our own Colonies have been remarkable, far exceeding our own imports in many cases. With regard to pipes it is estimated that the removal of German competition may lead to the doubling of British exports. In some countries we possess a great part of the trade, but in others the Germans had captured it entirely, notably in Continental countries, such as Belgium.

At the end of the war there must undoubtedly follow a period of reconstruction in which German competition will be absent. In any case it is clear that for the present German competition has ceased to exist, and that the large markets formerly supplied by German firms will be open for the manufacturers of other nations.

The commercial conditions in the iron and steel tube trade, as in all other branches of the steel trade, have been particularly difficult during the past year. The volume of the home trade has been exceptionally good throughout the year, but prices were very low in the export trade, particularly during the first six months, due to the acute trade depression in Germany, which led to abnormal and organised dumping operations from that quarter.

Our Colonies and South America in particular have all suffered from trade depression during the year, which has been accentuated since hostilities began.

As a result of the prosperity in the previous year (1913) considerable extensions to works were undertaken.

The present lack of demand from our Colonies has meantime been largely counteracted by the abnormal requirements of the War Office and Admiralty, and it is anticipated that as these abnormal demands decrease rapid Colonial developments will take their place. Undoubtedly a great many Colonial orders temporarily suspended during the last five months of the year will be placed directly decisive results in favour of the Allies become apparent, not only to the extent of keeping present plant fully employed, but providing work for the new plant on point of completion.

DIFFICULTIES WITH CONCRETE STRUCTURES.

With regard to the difficulties due to the contraction of concrete, it is interesting to note that tests to determine the thermal changes in large masses of masonry are being undertaken by the Board of Water Supply of the City of New York at the Kensico Dam, Valhalla, N.Y. The dam is being built of cyclopean masonry, faced on the up-stream side with moulded concrete blocks and on the down-stream side with granite. This dam will have vertical expansion joints. The results of the tests should be of considerable interest, as they will show the effects of temperature changes upon this mass of masonry, and should indicate the internal stresses set up. Special instruments will be used consisting of two coils of fine wire of two metals, having different temperature coefficients of electrical resistance, connected in circuit with batteries and a galvanometer. The wires are of such a size and length that a small temperature change will cause a measurable change in the electrical resistance which will be indicated by the galvanometer or which may be detected by a telephone. These instruments are embedded in the masonry as the work proceeds.

The vexed question of leakage in concrete structures due to the development of cracks has exercised the minds of many engineers, and will probably continue to do so. Where plain concrete is used it is common experience that cracks develop in structures above the ground. Such cracks are generally made good, and may or may not give further trouble, according to the particular conditions of the case. In underground structures the trouble is generally less, and even if it exists is less apparent. It cannot be said that expansion joints provide any very satisfactory solution of the difficulty. Most engineers have experienced difficulties of the kind mentioned, and it will generally be found that the only solution of the difficulty is to repair the cracks and to hope for the best. Furthermore it is generally found that, practically speaking, the cracks having been once repaired give very little trouble.

With regard to this matter it is interesting to

note first that the engineers of the Catskill Aqueduct are no more free from troubles than their English brethren, and next that they are no more able to solve the problem than we are ourselves. It is both consoling and productive of the best of feelings when we read the frank statement in the American engineering press that "experiments show that percolation of water through walls of conduits takes place almost entirely through expansion joints." That is exactly where we should expect to find it in our own work. The engineer has two alternatives—either to make his work monolithic and to have cracks develop at irregular intervals or to make expansion joints and so find that the differences in temperature produce opening and shutting.

We read in the *Engineering Record* of New York a report of the Catskill Aqueduct: "As would be expected, the most important factor causing variation in joint opening, and therefore in leakage, is the difference between the temperature of the concrete at the time it was placed and at the time of making the test. Whenever the latter temperature was higher than the former, the joints were comparatively tight. Under the reversed conditions the greater openings or leakages occurred with the greater differences of temperature. The temperature factor was so great that all other factors were obscured by it; yet those other factors were of enough influence to prevent the deduction of the law of relation of leakage to temperature leakage. The following statements may, however, be confidently made:—(1) Leakage from the cut and cover aqueduct is almost entirely through the joints . . . very little through the concrete mass or elsewhere than at the expansion joints. (2) There is a progressive diminution in the amount of leakage with the lapse of time entirely independent of temperature influence, and (3) the method of stopping leakage through the expansion joints by filling with Portland cement grout is satisfactory, effective, and permanent." It is the final conclusion that throws most light on the subject. Those grouted expansion joints will expand no more; but if they are grouted while the temperature is high they will certainly open again when the temperature falls. It seems that from this we can learn nothing new. The concrete tunnel will develop cracks; but after these have been made good they will give no more trouble, because the tunnel is kept full of water, and the temperature does not vary to any great extent. The troubles at the Catskill Aqueduct are in conformity with general experience elsewhere, and they appear to provide an argument in favour of reinforced concrete.

[illegible] WATER DAMS.

A very large number of dams of the greatest size and importance, constructed in various ways under differing conditions, exist in the world at the present time. Some of these have failed entirely, and others have given great trouble owing to leakage, while the rest have fulfilled their purpose and exist as examples of engineering skill. Naturally a very great deal of attention has been given to the subject, the chief result of which has been to show the absolute importance of geological considerations. The necessity for the most careful geological survey being made over the whole site of any proposed reservoir has been established. Money expended in such work is to be regarded in the light of an insurance, and any saving of expense in this respect is the greatest folly. An increasing number of examples of large storage reservoirs which leak owing to unexpected faults and fissures amply demonstrate the importance of the most careful geological investigations being made as a preliminary step.

We find that new masonry dams are now being constructed on granite or other rock which has first been treated by making borings and grouting all possible fissures with cement under pressure. One may also study with advantage a number of instances where engineers have courageously faced appalling difficulties in cases where dams or reservoirs have shown serious leakages. There are a good many cases which might be referred to, some of which are being dealt with at the present time. A good instance is the case of Loch Arklet. The dam which holds up the water of the loch to its new level is constructed of concrete faced with masonry. Its length is 1,050 ft., and its greatest height is about 35 ft. Its foundations are solid rock, but about half-way across the dam a bad fault crossed the foundations diagonally, terminating on the downstream side in a large pocket of soft material. This bad material had all to be cut out, so that for a length of about 50 ft. the foundation to the bottom is 100 ft. below the top of the dam.

These difficulties have now been entirely overcome. Again, the new Kelso reservoir, recently completed, was found to leak at one of the sides near the dam. The dam is built in solid rock, and it is believed that the water is escaping at some fissure in the side. Many more instances could be quoted showing the difficulties with which the engineer has to deal.

The sealing or filling of fissures in rock by means of grouting with cement is being adopted as one of the recognised methods of engineering construction. In making the deep shafts and tunnels of the Catskill Aqueduct cement was injected at very high pressure with good results, a pressure of 1,000 lb. per square inch being used at times. Where a shaft has to be sunk in fissured rock full of water it has been found possible to sink borings 90 ft. or more in depth and to inject cement at such pressure and in such quantities as to fill and seal the fissures in the rock round the shaft, after which the shaft can be excavated without further difficulty from the water. Similarly, tunnels can be driven after the water-bearing fissures have been sealed.

[illegible]

Several books and many papers and treatises of great merit have been published during the past year. To review the whole of the year's literature would indeed be a great task. From this it is apparent that our best workers are keeping a careful record of their doings and are following the excellent plan of making all new results known to the world as quickly as possible. We may refer to such typical examples as the reports of Dr. Houston to the Metropolitan Water Board, to the Board's Annual Report, to the Memoirs of the Geological Survey, and the reports of the Local Government Board. It is to be noted that the presidential addresses of the Institution of Civil Engineers and of the Society of Engineers each dealt with the subject of water supply.

Mr. Allen Hazen's book, entitled "Clean Water and How to Get It," discusses every kind of water supply, and is certainly one of the most valuable works of the year. "Water Supplies: their Purification, Filtration, and Sterilisation," by Drs. S. and E. Rideal, is also a book which should receive careful consideration, containing as it does the latest information upon water treatment. Another very excellent book is that of Mr. George Chandler Whipple on the "Microscopy of Drinking Water."

It is quite impossible in the present article even to refer to the very large number of books, papers, and treatises which have appeared during the past year. The papers read before the Institution of Water Engineers, though fewer in number than usual, are of considerable importance and merit; also those read before the Society of Engineers; while the paper read by Mr. Lewis Mitchell on "The Provision of a Municipal Water Service" has been reviewed so recently in these pages that further reference to it is unnecessary.

Institution of Electrical Engineers.—It is officially announced that there will be no annual dinner of the institution during the present session.

Johannesburg Town Hall and Municipal Offices.

EXTENSIVE USE OF REINFORCED CONCRETE.

JOHANNESBURG TOWN HALL AND MUNICIPAL OFFICES.

Among the most important features in the construction of the Johannesburg town hall and municipal offices is the extensive use which has been made of reinforced concrete, there being no less than 130,000 sq. ft. of flooring constructed in this material, and a total use of approximately 200 tons of reinforcing steel. The architects, Messrs. Hawke & Mackinlay, of Johannesburg, adopted reinforced concrete for practically the whole of the constructional work. It was their original intention to employ rolled steel joists and stanchions, but after careful consideration and comparison, it was found that a considerable saving could be effected by the use of reinforced concrete.

The reinforced concrete work was designed in the Kahn system by the Trussed Concrete Steel Company, Limited, Carlton House, Westminster. The floors were calculated for a superimposed load of 1 cwt. per square foot, and the calculations were based on the recommendations for reinforced concrete design as issued by the Royal Institute of British Architects, together with the regulations of the local by-laws.

The position of the building is a central one, and the front façade, measuring 200 ft., is directly opposite the General Post Office, the sides extending 400 ft., face Market and President streets respectively, while the back adjoins an extensive garden scheme which is at present being carried out. The total height of the building from the basement to the top of the dome is approximately 130 ft. In the centre of the building is a large open courtyard measuring 83 ft. by 63 ft., which provides light and air to the inner offices. The basement, which extends over approximately half the area of the building, is chiefly occupied by air and heating chambers (in connection with the Plenum system of ventilation), by offices for the tramways department, and by a large strong room measuring 84 ft. by 32 ft.

Fig. 1 is a ground floor plan showing the arrangement of the reinforced concrete beams. It will be noted that the construction is fairly simple and straightforward, although the numerous different levels of the floor necessitated exceptional care in the preparation of the detail working drawings. The arrangement of beams was fixed generally by architectural considerations, and was not always economical from the purely constructional standpoint. All the reinforced concrete beams are indicated by numbers which are arranged on a schedule giving in detail the size of the beam, and the reinforcement required for each. In many cases special details of reinforcement in the beams were given in drawings of which Fig. 2 is a typical instance. It will be noticed from the plan that in a few cases the slabs are of considerable span. The largest of them is approximately 21 ft. span, being 9 in. thick, with reinforcement consisting of ¾-in. Kahn trussed bars, placed at 15-in. centres, running in both directions. The ground floor consists principally of the main concert hall, the Selborne hall, the rates hall, and the municipal offices. The main concert or town hall is 150 ft. long by 90 ft. wide, with a height of 60 ft. from floor to ceiling, and has a seating accommodation for 3,000 people. The floor of this hall is of American maple set on springs, while the organ and orchestra floors, with the cantilever balconettes and corridors, are all of reinforced concrete. The proscenium opening, 45 ft. wide, is spanned by a reinforced concrete beam 66 in. deep by 27 in. wide, reinforced with three 1¾-in. Kahn trussed bars and two 1-in. and six ¾-in. Kahn rib bars, all the latter being bent up towards the ends.

The rates hall, 84 ft. by 62 ft., is situated near the main entrance. Over this hall there is a very heavy reinforced concrete beam (marked 29 on Fig. 1), the size of which is 30 in. deep by 18 in. wide, reinforced in the bottom with three 1¾-in. Kahn trussed bars and two 1¼-in. and four 1¾-in. Kahn rib bars, making a total cross sectional area of 12·87 sq. in. of reinforcing steel, together with four 1¾-in. Kahn trussed bars in the top of the beam. The details of the reinforcement are shown on Fig. 2. The total load on this beam was 52 tons, of which 26 tons were uniformly distributed, the other load consisting of two 13-ton point loads concentrated at the two-third points of the beam. As a typical example, it is interesting to note that if this beam had been constructed in steelwork it would have required a 22-in. by 12-in. rectangular girder weighing 173 lb. per lineal ft., and the overall size of this girder cased in concrete would have been 26 in. by 16 in., which is slightly less than the size of the reinforced concrete beam. The fol-

lowing, however, is a comparison of the approximate cost of the two methods of construction. For fire-protective purposes it would have been necessary to encase the girder in concrete, which, as previously stated, would have been slightly less in overall size than the size of the reinforced concrete beam, and the difference in concrete is credited to the steel-work.

	Per foot-run.
In steelwork—	
173 lb. at 20s. per 100 lb. ...	£1 15 0
In reinforced concrete—	
75 lb. at 30s. per 100 lb. £1 2 6	
Saving of concrete and centering in favour of steel girder, say 1s 6d. per foot-run .. 1 6	1 4 0
	0 11 0

This comparison—it is pointed out in *Kahnoid Engineering*, to which we are indebted for these details—shows a saving of 11s. per foot-run, or approximately 33 per cent of the total cost of the steel compound girder, in favour of the reinforced concrete beam.

The columns in the rates hall are 4ft 2in. square reinforced with Kahn rib bars laced together with ⅛-in. diameter wire ties, the number of verticals and the spacing of the ties varying according to the load to be carried. These columns run down to a solid rock foundation.

The council chamber measures 67 ft. by 30 ft., including the reinforced concrete gallery. It has a lofty panelled and richly moulded dome-shaped ceiling, the height from the floor to the top of the dome being 30 ft.

The Selborne hall, like the main hall, has an American maple floor set on springs. Along either side are doors leading to balconies, one looking on to President-street and the other overlooking the inner court. At one end is the stage, under which are the artists' dressing-rooms, while at the opposite end

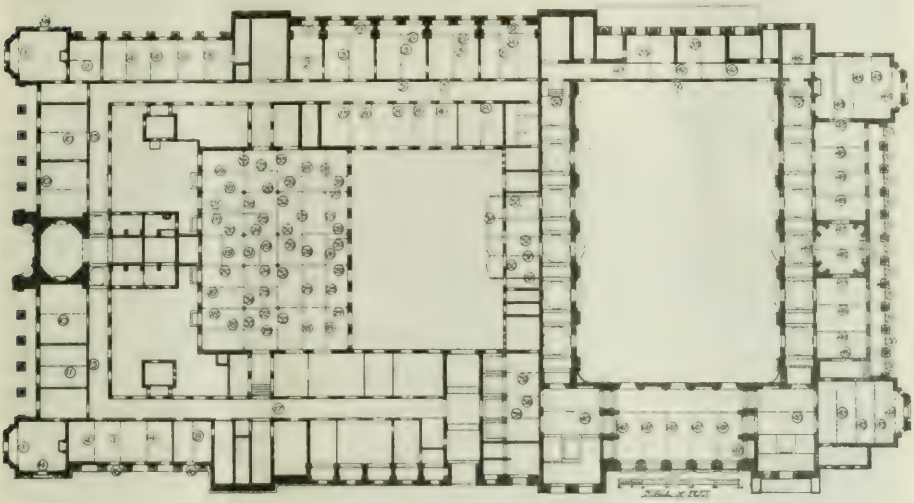

FIG. 1.—GROUND FLOOR PLAN, JOHANNESBURG TOWN HALL.

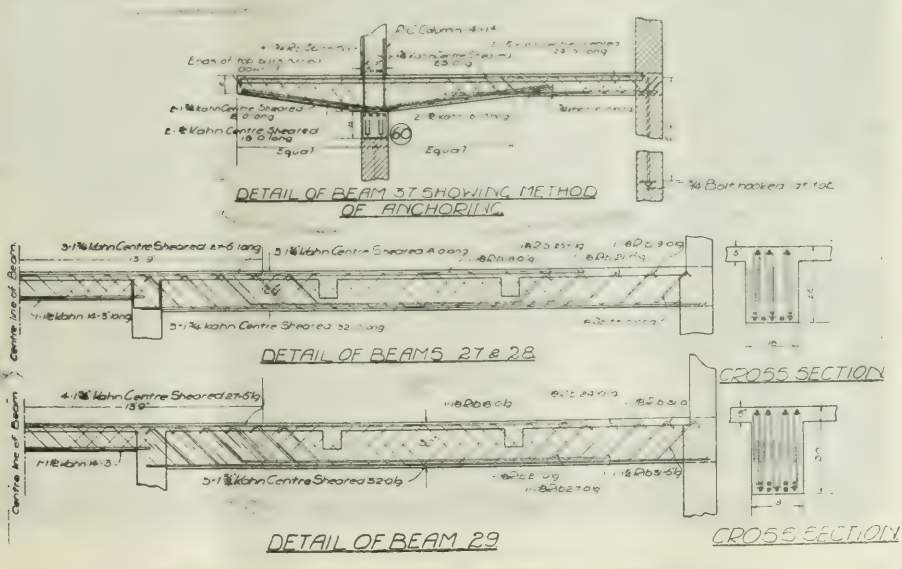

FIG. 2.—TYPICAL DETAILS OF BEAMS, JOHANNESBURG TOWN HALL.

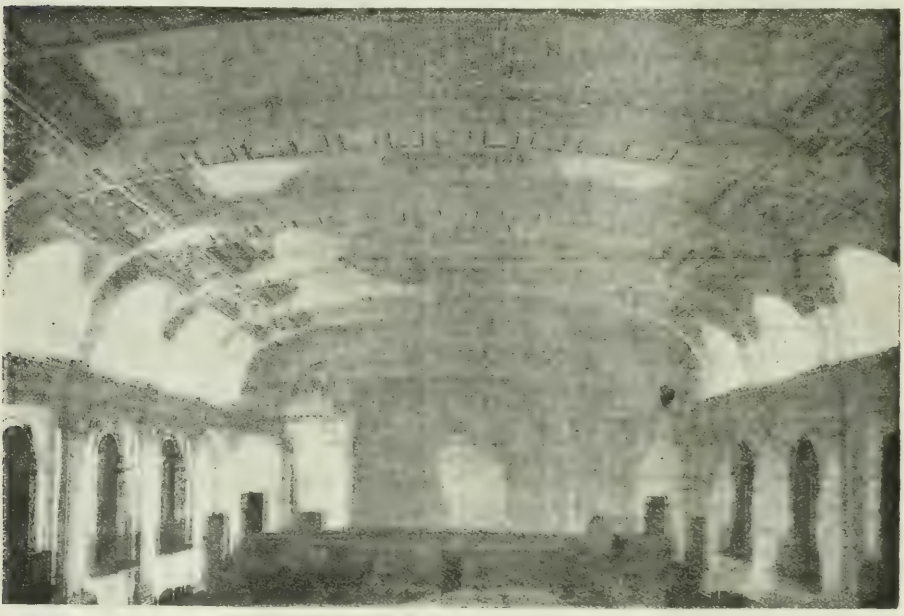
is a cantilever gallery constructed entirely in reinforced concrete.

Around the main hall on this floor there are spacious lounge corridors, crush halls, and foyers, all the floors of which are in reinforced concrete, finished in mosaic. Leading from the corridor at one side is a conservatory and refreshment room, the conservatory being cantilevered out over the inner court and carried on beams marked A on the plan (Fig. 1). The loads on these beams were not sufficient to balance the upper tendency due to the cantilevering action, and it was therefore necessary to provide additional tailing-down weight by means of anchoring the beams to the brickwork underneath with long bolts.

PLACING KAHN SYSTEM REINFORCEMENT IN FLOORS, JOHANNESBURG TOWN HALL



MAIN GALLERY HALL, JOHANNESBURG TOWN HALL

The tower, which forms the central feature of the front façade, as will be seen from the general view of the building, is carried up directly over the front

entrance. The dome surmounting it is 20 ft. span, and is constructed of a 6-in. thickness of concrete, with a mesh of 2-in. Kahn rib bars, the dome being

of the grounds and gardens, which, we [illegible] nearly an additional £6,000.

The building was erected by Mr. M. I. A. M[illegible]

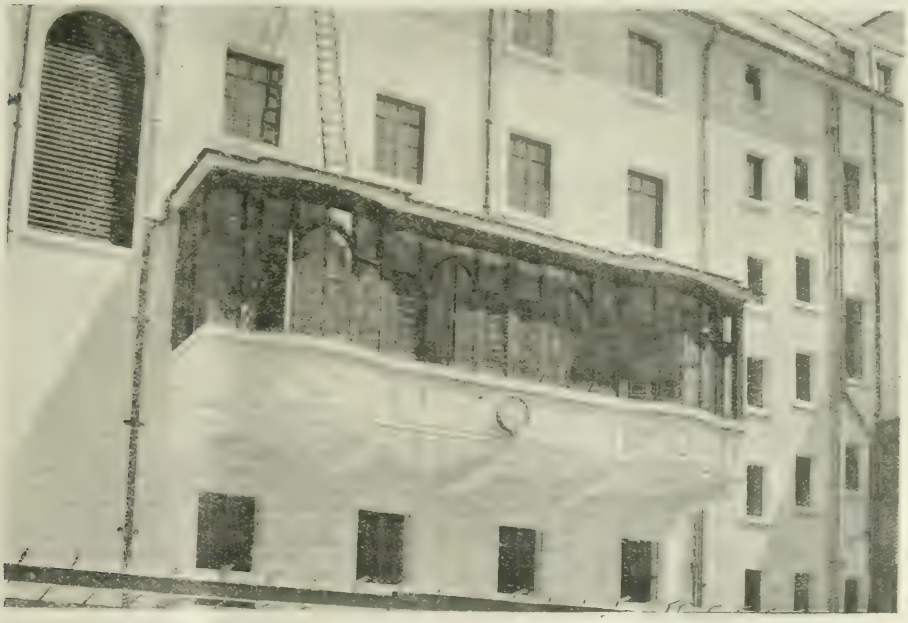
finished on the outside with green [illegible]. The [illegible] pitched roofs are also covered with green tiles, and

were signed the contract in January 1912 and completed the work before the end of 1914.



Cantilevered Conservatory in Inner Court, Johannesburg Town Hall.

the contrast between these and the grey stone with which the building is faced is very pleasing.

The total cost of the work was approximately £300,000, which figure does not include the laying out

"Pudlo."—His Majesty's Office of Works are users of "Pudlo," and in the Dundee new post-office the cement mortar and all renderings are to be waterproofed with the material.

Groynes and Sea Walls.

By A. T. WALMISLEY, M.INST.C.E.

Sea defence works combine the construction of sea walls and groynes, the latter being used for the purpose of gathering the shingle and thereby raising the beach of a foreshore. They stay the littoral drifting action. Groynes themselves cannot be regarded as a protection to a shore, but are serviceable in the effect they produce on the beach, mainly across the intersection of the lines of high and low water levels upon a foreshore. They do not create fresh material, but rely on wasting cliffs, &c., to contribute fresh supplies which they collect. The term "foreshore" is frequently limited to land lying between the levels of high and low water of ordinary spring tides, but legal rights may include the bed of a navigable river under special circumstances.

The whole subject of foreshore protection is most intricate. Groynes should not be put in without a proper consideration of the local conditions. The removal of shingle from a coast by which the latter is robbed of its natural protection should not be allowed. The object should be to arrest the shingle upon the windward side of a groyne without producing too much scour upon the lee side. The natural barriers which exist against the denuding action of the sea should be maintained.

Waves do not consist of a forward movement of a mass of water, but their action in the open sea may be compared to a water wheel being due to a disturbance propagated through the water. So long as the imaginary wheel in its oscillations does not touch the bottom, no forward motion is given to the wheel, and a wave of oscillation is formed. As the motion is, under such circumstances, simply up and down, unless the crest is propelled by wind, the water resists being unlevel, and seeks to return to a level. If the supposed wheel is in action in water of a depth, where it touches the bottom, or where it strikes a resistance, then a wave of translation is formed, and the water travels in a direction dependent upon the influence of such obstruction to its oscillation, the forward translating motion increasing as the water becomes shallower.

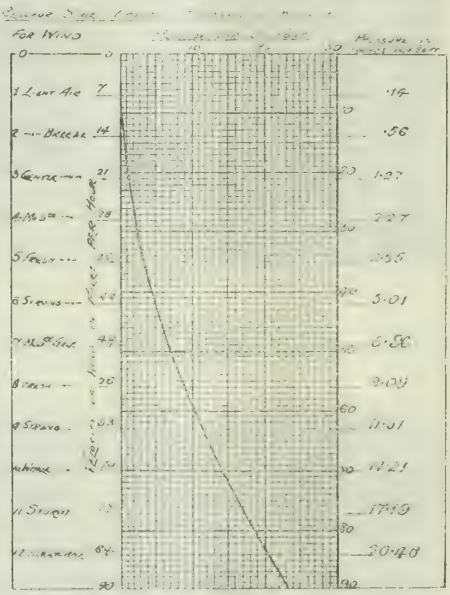
The waves that break upon a shore are due to wind, but intervening shoals will also break up a wave. Alongside winds are the chief motive power in transporting shingle, and sand, as low down as the wave action extends. Below the wave action the tidal or other currents exercise a transporting influence. When a flood tide and a heavy sea run in the same direction there are heavy waves, but when the tide runs in opposition to the wind waves, there is a choppy sea, the tide tending to run down the waves. It is the wave action created by the prevailing wind of the locality, and not by the wave action of the flood tide, that reduces movement of beach on a shore.

The force of waves which beat under the action of a gale against a cliff or sea wall increases nearly as the cube of the depth of the water upon the foreshore in front of them. As the beach becomes lowered, the depth of water increases, and consequently the volume and velocity of the wave. Therefore at high water the most damage is accomplished, although at low water the effects seem to be the greatest.

The effect of gales is greatest when the wind, after blowing along the coast in the same direction as the main stream of the flood tide, changes about the time of high water to an on-shore direction. The force of the wind depends mainly upon the locality. A pressure of 1 lb. per square foot of exposed surface is produced by a velocity averaging 18½ miles per hour. A pressure of 40 lb. per square foot would be produced by a mean velocity of 117 miles per hour, and a pressure of 56 lb. per square foot would be produced by a mean velocity of 139 miles per hour. These comparisons are based upon the formula $P = \cdot 0029V^2$, where P = unit pressure in pounds per square foot, and V = mean velocity of the wind in miles. Some authorities assume a higher value, and take $P = \cdot 005V^2$. It is generally found that wind pressure is much greater near the sea than inland, and also at high elevations than in low countries.

Mid-ocean tides rise and fall comparatively to a small amount, but as soon as a tidal wave has traversed the ocean and become influenced by coast conditions, an hydraulic head becomes formed in its passage, and tidal ranges are the result.

A wave is "a form," and not "a thing." The form advances, but not the substance of the waves, and results in waves of oscillation. When a corkscrew is turned round, the thread appears to move forward, and the apparent onward motion of waves at sea is a similar delusion. Waves have a vertical motion. The wind pressing unequally on the surface of the sea depresses one part more than another. Every depression causes a corresponding elevation, and these undulations are called waves. A record storm that makes a "washout" of the beach sucks it out below the level of the lowest spring tide into the run of the off-shore current that carries it off. Here, however, the on-shore current comes in and tends to drive the material back landwards. The result de-



WIND PRESSURE.

P = wind pressure in pounds per square foot.
V = mean velocity in miles per hour.
$P = \cdot 0029V^2$.

A pressure of 0·7 pound per square foot is produced by a velocity averaging 15½ miles per hour.

A pressure of 25 pound per square foot is produced by a mean velocity of 93·0 miles per hour.

A pressure of 47 pounds per square foot is produced by a mean velocity of 125 miles per hour.

pends on the wind waves—whether favourable to help reclamation or to denude the foreshore. At every high water the on-shore current will endeavour to rescue from the off-shore current, but, in spite of its efforts, a considerable portion of the sucked-out beach remains appropriated by the off-shore current.

The wind waves are merely the distant echoes of the greater waves elsewhere. They originate in the pressure of the wind upon the surface of the open sea, and the attempt of the water to regain its level. Irregularity of pressure creates oscillatory movements which radiate from the place of origin until they die out or reach the shore.

The reception of waves being due to the wind, their development depends upon the amount of surface acted upon. The greater the length of open sea (other things being equal) the higher will be the wave which breaks upon the shore, provided, of course, that there is sufficient depth of water to admit of its formation. The length of sea surface within which the wave attains its development is termed "the fetch," which is the distance in any

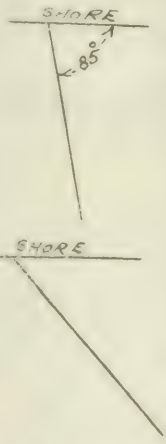
direction which is freely traversed by waves driven by the wind. The long low undulations of roll to create a ground-swell on approach to shallow water, and the breaking process is detrimental to a beach from undermining and scour.

All friable cliffs are undergoing more or less the influence of sea action, a stormy sea being active in erosion. A road constructed at the foot of a cliff above high-water level will act as an apron to save a cliff from falling; but where soft beds occur, and land springs exist at the level of marine erosion, a layer of clay would become greasy, while a layer of chalk would be dissolved.

At Sandgate, upon the South Coast, the cliffs are protected by a public road which is bounded by a sea wall. This wall, being shallow, depended upon the beach in front of it for its stability, and the beach was dependent upon the maintenance of groynes. In the absence of an efficient groyning there should have been a deeper and stronger revetment at the sea side of the main road. In the year 1894, during the visitation of a low tide, the beach proved deficient to protect the wall, and currents issuing at the junction of a fine, silty clay, which underlies the Hythe beds above the road, known as Atherfield clay, which freely absorbs water, a lubricated surface became intensified with a lateral movement of the cliff as the result of unequal vertical pressures. All such cliffs need to be well drained, and protected at the toe of their slope; also the upper surface of such roads should be sufficiently solid to prevent destruction by water falling upon it.

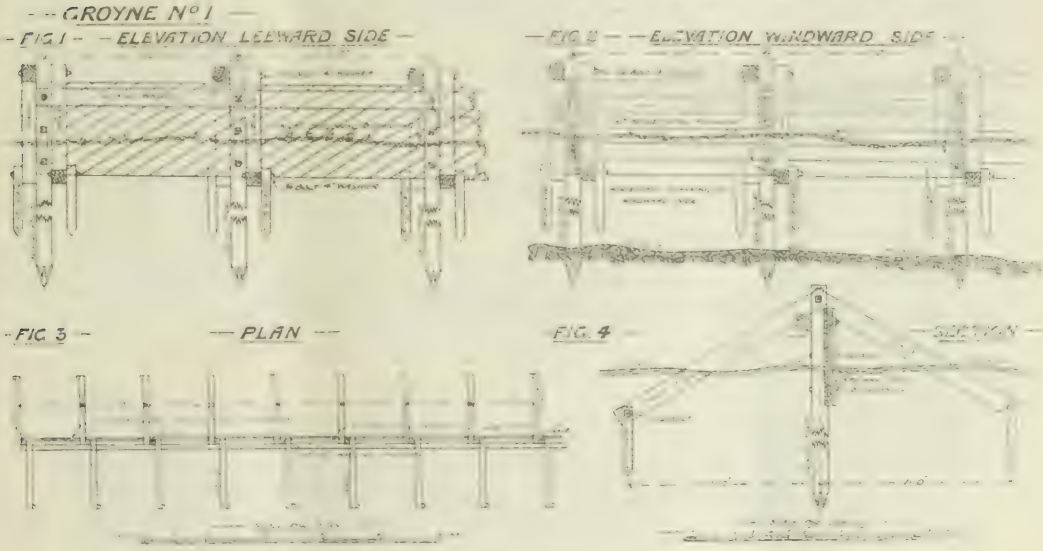
At Dover the whole foreshore is beach, upon which the houses, and parade in front of the houses, are built. The storm angle of the beach was 1 in 10, and prior to the extension of the Admiralty Pier and the formation of the eastern pier of the Government Harbour, the beach was practically inclined in front of the Marine Parade at this inclination up to the Harbour Board's boundary groyne upon the west side of East Cliff, Dover. Hence, when the parade was widened, it was not considered necessary to do more than to retain the beach under the tarred paved walk by a concrete vertical diaphragm. A retaining wall has now had to be substituted, a post-and-rail fence placed at its outer edge, and the groynes to retain the beach on the west side thereof extended further out to sea.

The secret of successful work is to connect groynes at the top end with a sea wall, to carry them well out into low water, to construct them only sufficiently high to retain the beach and not to obstruct the rush of water over the beach, and to provide them with an inclination of top edge parallel to the storm angle of the beach, which, upon the South Coast, is known to be 1 in 10. They should be placed, approximately, at an angle of 95 deg. to the flood tide, or at 85 deg. from a shore, running parallel thereto, and at a distance apart equal to the distance of their crests from the upper sea wall at their top end. Though the flood tide has very little to do with the actual [illegible] affected by the [illegible] exposed above the level of the beach to its direction. Groynes placed at angles more acute with the shore may secure the beach from scour on the lee side of them, but they assist the run of the sea in removal of the shingle on their weather side as they do not afford "pocketing" for the beach, which is pushed against them by the translating action above demonstrated. On shore, tidal currents help to build up the coast defences, the power of their velocity transporting material within tidal [illegible].



The sea wall and groyning at Hove, Sussex [illegible] as a successful undertaking. As a contrast, part of the [illegible] between Hove and Littlehampton was protected with groynes on a slanting direction to the prevailing winds.

The [illegible] of the flood tide [illegible] South



work of destruction being the action of the backwash, the beach is denuded during on-shore gales, and grows during those winds blowing off-shore due to the lack of power to drive it down the foreshore again. The direction of the prevailing on-shore winds generally coincides with the direction of flood tide. The foreshore above high-water level is not denuded by tidal action, but by the combination of wind and wave.

The interference of rocks or rising banks in the sea with the regular form of the waves, by which the [illegible] of the wave is broken, causes a breaker. The phase of the curve is the outline or arc of the wave. The wind driving the surface of the water from the top of the wave and scattering the small particles in all directions, produces the spray of waves. When a beach consists of loose shingle, a certain amount of water necessarily soaks into the area above low water, while stones are either carried along or thrown forward by the waves, and become deposited when the water recedes to attain its level, the effect of such action being in proportion as the power of the reflux

action becomes diminished, and it is thought by some that this fact may account for the comparative steepness of foreshores above tidal influence.

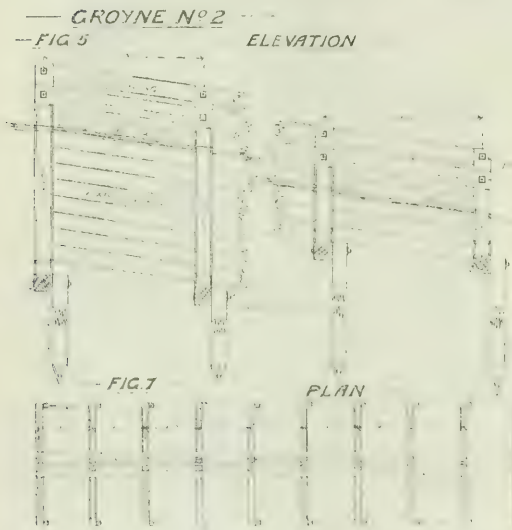
A portion, instead of going forward, buckles under itself, similar to turning a somersault, and disperses in a wave of translation. As the base of the wave gradually approaches shoal water it becomes more and more retarded, while the crest, at a greater distance from the bottom, maintains a greater velocity, overtakes the lower portion of the wave, and at last breaks or falls over the top of it, as soon as it has exploded itself. We might compare the wave carrying shingle to a gun charged with shot and without shingle to a gun firing blank ammunition.

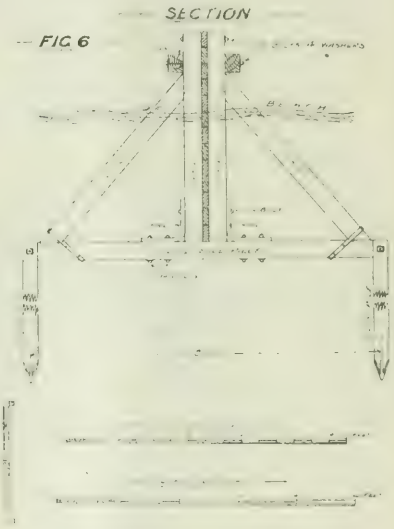
The work of the sea is, generally speaking, the work of transportation. The law of the eastward drift is well known along the South Coast, while on the East Coast the littoral drift is from north to south, the direction of the waves being principally determined by the prevailing wind. The heaviest seas are from the south-west upon the South Coast, and from the north-east upon the East Coast. The direction of those seas correspond with that of the flood tide. The waves that break upon a shore are due to the prevailing rather than to an occasional dominant wind when influencing the direction of littoral drift. The travelling action may be thus roughly described: If a pebble A is so struck by a wave as to move upon the shore in a direction Aa, the wave breaks partly into a spray, and is dispersed in all directions, and is partly absorbed, and descends in a shallow form; but some pebbles become cast beyond its reach by the crest of the wave pushing forward as does the other is just like the man throwing a stone [illegible] cast beyond the reach of the tide. The largest stones go farthest, the smallest stop first: so that the portion of the beach nearest the shore is usually composed of the largest stones, but, as regards those pebbles left within the influence of reflux wave action, these begin to have a forward translating motion, which translating motion increases as the water becomes shallower, but is reduced by the friction of the foreshore. In this action, the particle "a" is washed down to B. The forward wave action, under tidal influence aided by prevailing wind, then moves the particle B to "b," and by similar processes it is transferred from A to "c," and so on, until resisted by a groyne. At low water, or in places on a foreshore where the influences of transportation are less active, sand will be observed to be deposited.

The order of a beach in connection with a cliff as a boundary on shore, if there are no rocks, appears, in general, to be as follows:—

Above the level of ordinary high water spring tides is an accumulation of shingle; between high water spring tide and high water neap tides are shingle and gravel. This may extend to low water neap tide level, but usually there is a coarse sand having at its extreme margin a thin fringe of shingle; below the latter to low water spring tide is hard, fine sand, while seaward, for unknown distances, are shingle, gravel and sand in the stream of the off-shore current.

Groynes do not create beach, but they arrest it. Their construction is described by Figs. 1 to 16. They tend to pocket the beach pushed against them by translating action. If a groyne is constructed sufficiently high, it creates scour upon the lee side. At low water, where the influence of transportation becomes less active, sand is usually observed to be deposited.



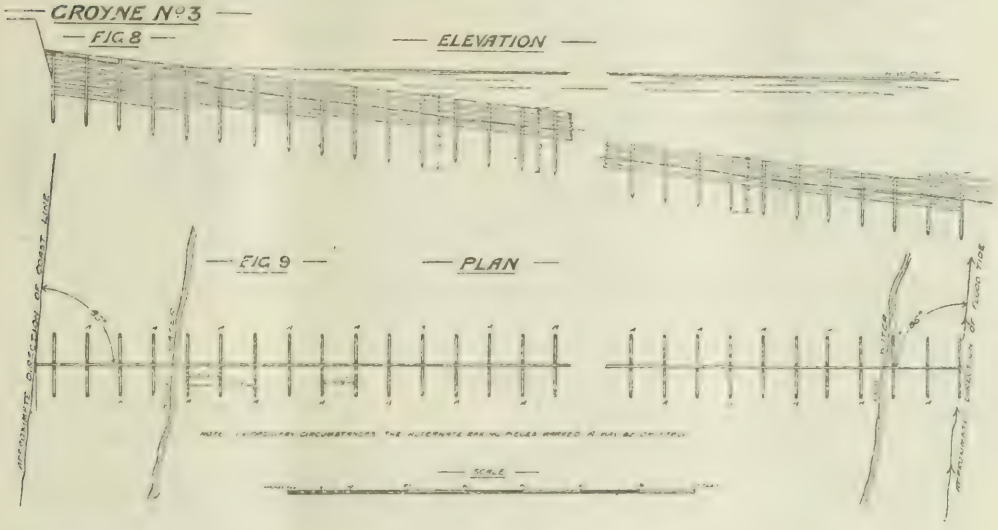


Groyne No. 1 is formed, as shown in Figs. 1 to 4, by 12-in. square piles, placed 11-ft. centres, fitted with wrought iron shoes and driven to the rock. The intermediate pairs of bays are screened upon the windward side with 11-in. by 3-in. planking, attached to the main verticals and secured as shown in Fig. 2, by short vertical pieces of raking metal attached thereto with 1¼-in. diameter bolts. Upon the seaward side (Fig. 1), 12-in. long by 10-in. walling pieces connect the tops of the main piles together, and 8-in. by 2-in. diagonal boarding is fixed between these piles. As indicated in Fig. 4, there are land struts in the shape of 12-in. by 10-in. raking pieces provided upon each side of the main piles, which are secured at their feet by 6-in. by 6-in. verticals, 4 ft. long, driven below the beach, as shown in Fig. 4, and as [illegible] in Fig. 3. The use of [illegible] deals is preferable to 11-in. deals for diagonal boarding, because the wider the planking the more irregular is the grain of the wood.

Groyne No. 2 is constructed, as shown in Figs. 5 to 7, consisting of double 10-in. by 10-in. vertical timbers, as shown in Fig. 5, fitted with [illegible] each placed 20-ft. centres as shown in Fig. 6 [illegible] and 6-ft. 6-in. centres

longitudinally, as shown in plan in Fig. 7, driven below the upper surface of the foreshore, supporting sole pieces 12-in. by 12-in., upon which short vertical 12-in. by 12-in. piles stand, which are stamped at their feet, as shewn, by bent pieces of old rail, and are connected at the top by 12-in. by 10-in. waling pieces. The railway metal is connected to the vertical by 1¼-in. diameter through bolts and coach screw to the sole piece.

be dispensed with when building the groynes by the introduction of an improved pile point (Fig. 12). As shown, the point or shoe is made with a V-shaped head, from which rises a shank contrived to receive the vertical railway metals, which are connected therewith by bolts. The angle of the point can be made to be suitable for beach, sand, or clay, as required. For chalk and strata a sharper point, as shown

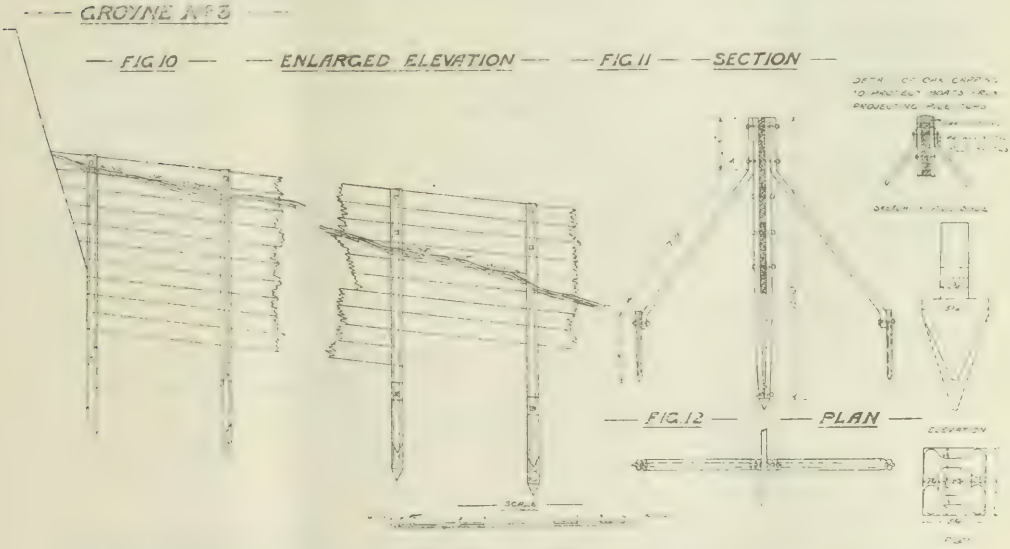


The screen is formed by 11-in. by 4-in. planking (Fig. 5), and the whole framework stiffened by 10-in. by 10-in. inclined ties, or raking pieces secured to the verticals and to the sole pieces, as indicated in Fig. 6.

In groyne No. 3 the verticals consist of old railway metals, generally in 22-ft. lengths, set out as shown in Figs. 8, 9 and 10, and stiffened by old rail raking pieces, connected (as indicated in Fig. 11)

dotted in Fig. 12, is applicable. The pile shoe is cast to suit the special section of rail adopted.

A system of open groynes which has been advocated by Mr. A. Dowson may be mentioned, consisting of uprights driven into the foreshore, having horizontal gratings attached to them, which, it is alleged, do trap and retain the shingle. This system has been employed in the estuary of the river Ribble, but the author prefers the addition of diagonal



by being placed either double at each vertical or alternately upon each side of the screen, as noted in Fig. 9. The planking between the verticals is demonstrated by Fig. 11, which also shows an oak capping. In the case of timber bolted between old rails, the practice has been adopted of welding the two metals together to form a driving point. This piece of smith's work, involving heavy labour, can

boarding as well as the longitudinal boarding, as shown in Fig. 1 for groyne No. 1, which tends to prevent apertures in a groyne, where beach could work through, and also serves in very exposed situations to tie the groynes well in, both at the head and foot.

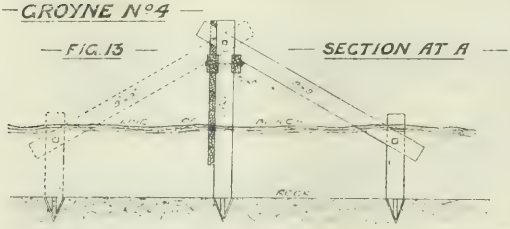
Upon flat foreshores covered with sand the sand may be arrested by laying down brushwood over the area

above low-water level, commencing at the windward side, and sowing the seed of suitable plants or grasses which will throw out roots in all directions, and will be protected by the brushwood in their growth until they acquire the necessary strength to take care of themselves. Brushwood retains its leaves when dead, and the wind, by bending the stems of the

them, and, as indicated by the enlarged scale section and plan, these uprights are set in concrete bases 3 ft. square, let into the shore, and about 4 ft. deep at 7-ft. 6-in. centres. The horizontal planks are placed two below the shore level and about three planks high above this level, the top planks being secured by spikes.

GROYNE N°4

FIG. 13 — SECTION AT A



SECTION AT B — FIG. 14

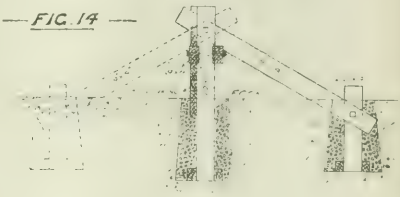


FIG. 15 — PLAN

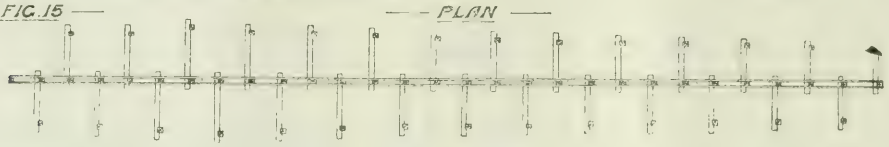

FIG. 16 — ELEVATION

sheeted planks, let down close to the sand and thus prevented the sand being blown by prevailing winds.

In Groyne No. 4 Figs. 13 to 16 is shown an example in which concrete bases are provided for the feet of the vertical piles, and also for the anchorage of the raking stiffeners (Fig. 14). Fig. 15 gives a plan and Fig. 16 gives an elevation of a groyne as put down upon this system at St. Margaret's Bay.

The wear on the lee side is minimised by the fact that they are low groynes, and require no struts or stays owing to the small surface exposed to the sea. They answer very well at Romney, for the sea front of the marsh, in the most southern part of Kent, where the tract of sand has a flat inclination; but in steep foreshores their life may be only a few hours, no piles being actually driven in this system, as they are not constructed to withstand the heavy pounding of beach

GROYNE N°5

FIG. 17 — ELEVATION

FIG. 18 — SECTION

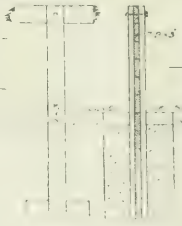

FIG. 19 — PLAN

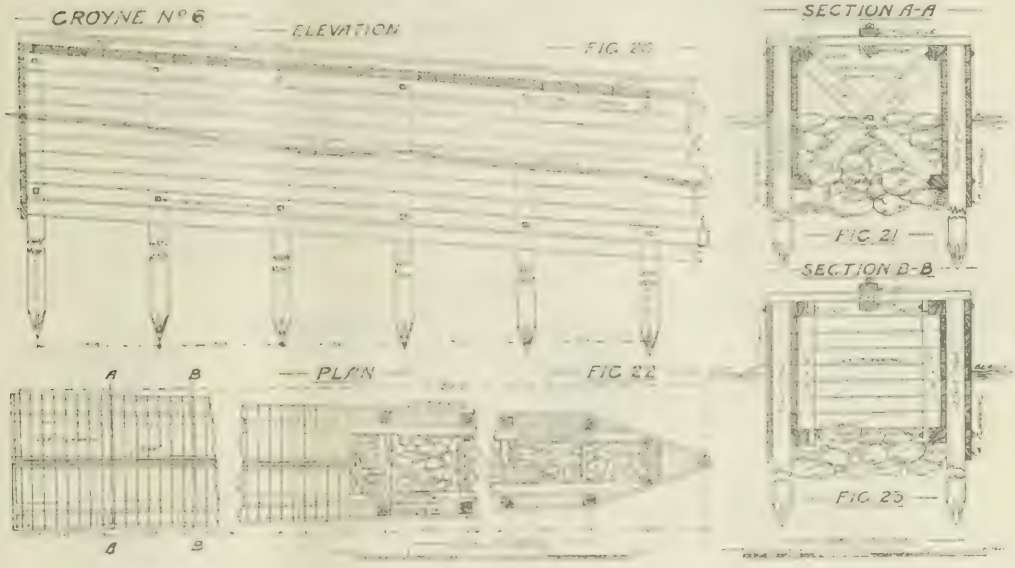
The velocity of a current, estimated as that acquired by water falling a distance equal to the height of the breaking wave v, is expressed by the formula $v = \sqrt{2gh}$, and for 1 ft. high V = 8 ft. per second, or $\sqrt{2 \times 32} = 8$.

Groyne No. 5 illustrates a groyne shown by Figs. 17, 18 and 19 upon the Case system, and consists of double upright timbers, 9 in. by 3 in., and 8 ft. long (see Fig. 17), with adjustable planking inserted between

and stones. Their object is to build up a foreshore to its natural inclination of repose, and to be gradually raised as an even accumulation becomes spread over the entire shore area, so as to obtain from the sea itself the necessary protection against its own ravages. They need careful alteration for maintenance, so that the first expense is not final. An endeavour to reach the travel of material seawards of low-water level has been made by chains carried out

to sea, and anchored to concrete blocks sunk at the foot of a groyne.

The movement of [illegible] is but very little affected by tidal currents. The sweep of the tide does not carry away projecting parts of a coast, but the tidal current becomes diverted inwards from off the shore, and the current, tending to increase in velocity where the obstruction is placed, we find beach and sand accumulate where the interception occurs, and scour [illegible] opposite to it. [illegible] as in Fig. 22 [illegible] as described in the section Figs. 21 and 23, the cross ties meeting the waling pieces in a bird's-mouth connection. This form of construction is suitable for situations where a broad-base foundation is needed, on account of the nature of the foreshore. For the deck, close planking is spiked to the walings and piles. The depth of sheeting depends upon the level of the beach, the planking being taken down [illegible]

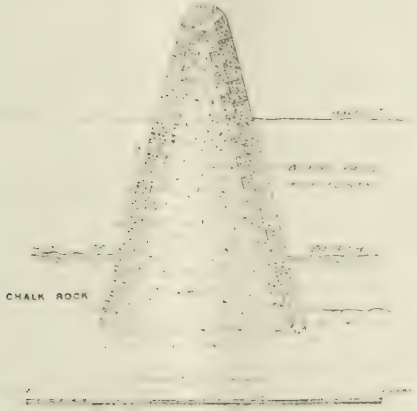


[illegible] away by reflux action where no [illegible] especially when aided by waves in rough weather. The tide has a velocity which, in the case of rivers, causes them [illegible] of their own creation; but above the tidal level it [illegible] and waves that influence a beach.

[illegible]

GROYNE N° 7

FIG. 24



the tides by raising or depressing the sea level along coasts. A strong on-shore wind increases the normal rise of the tide and prevents it from falling to its full extent. An off-shore wind produces the opposite result.

Groyne No. 6.—A box groyne is exhibited in Fig. 20

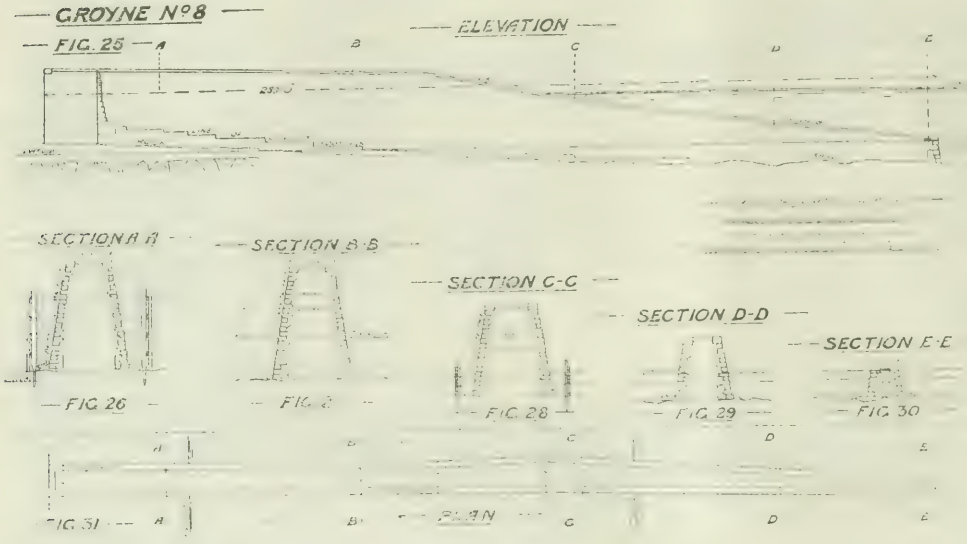
to the sub-stratum of the blue mud below the beach. The scour, as may be seen at any bridge pier in the dry season, begins at the nose of the pier and extends along the sides in a curve like a horn, and sand is usually deposited in a line with the tail of the pier. The scour is due to a vertical whirling motion of the water set up at the nose of the pier. This can be prevented by running out a false cutwater of pitching which will divide the water gently, and enable it to pass the pier with a steady and even flow. The shape of the surface of the pitching is very similar to that of a boat turned upside down, the part coming through about where the mast would be stepped. The best shape for a groyne is one to [illegible] which will best divide the water and allow it to reunite without shock and with minimum disturbance, and the contour of the [illegible]

Groyne No. 7.—[illegible] consisting of a mass-concrete centre, transversely curved at the [illegible] with [illegible] each side, formed with block work with flints, and carried down through the beach to a chalk foundation. This type of groyne was adopted upon the foreshore at Brighton. Six groynes were constructed in length [illegible] the average distance apart [illegible] being 710 ft. Some of the groynes at Brighton were built [illegible]

[illegible] suffer from the liability due to attrition of the shingle, causing the exposure of the reinforced metal [illegible] readily repaired as a timber groyne.

Groyne No. [illegible] has been [illegible] of Dover designed by Messrs. Walker and Burgess, and built about 1860-1. The materials used consisted of a core of Portland cement concrete, with Guernsey granite face-work in various sizes, roughly hammered for random courses, and [illegible] Medina cement. The [illegible] is of Aberdeen granite. It was found that the near-absorbent nature of Guernsey granite caused the [illegible] to fall out under the jarring nature of heavy seas, and subsequent pointing was substituted with ordinary cement mortar. At Hastings at the east end

of the foreshore, we have another example of concrete groyne, designed by Sir John Coode, and carried out from the shore into a depth of about 10 ft. at low water of spring tides. The top slopes seawards with a surface inclination of 1 in 9 at the outer end, this gradient having been found to correspond with the average slope of the Hastings foreshore under ordinary circumstances. Concrete blocks were employed faced with hard stone set in place for this work. The foundations were carried down to a level and sound



bed on the rock, and where deemed necessary the footing were protected from erosion by a concrete apron.

ROADS IN THE WESTERN FIGHTING AREA.

In a contribution from that acute observer "Eye Witness" published on Monday last, an interesting sidelight is thrown upon the road question as it affects the war in the actual fighting area. "It is difficult," says the writer, "for those who do not know something of the problem of maintaining an army in the field to realise what immense efforts and how great an amount of material are required to keep the roads in repair, especially under motor traffic. As has been already mentioned, one great difficulty of doing this in the part of France and Belgium in which we are operating lies in the fact that the paved portion of the roads is in most cases so narrow that vehicles cannot pass each other without going off it, and that the soft earth on each side is, in wet weather, soon churned up by the heavy lorries in use into a mass of mud upwards of 2 ft. in depth. It has been found necessary, therefore, to improvise some method of increasing the width of the hard surface of the roadway, so as to allow of traffic on each side. This is now being successfully done.

"Although the pave is one of the most ancient and durable forms of road, even it is broken up in time by the continual passage of heavy motor lorries. The stones get displaced, and water percolates into the foundation, which is often merely sand or chalk, and washes it away. Then, if there should be a frost after the surface is thus cracked, the moisture which has penetrated freezes and breaks it up still further. The consequence is that the pave itself needs continual attention."

The Ruislip-Northwood Town Planning Scheme.—We have received from Mr. W. Louis Carr, surveyor to the urban district council, copies of the Ruislip-Northwood town planning scheme and coloured map, which, we are asked to state, are obtainable at a charge of 6s.—1s. for the scheme and 5s. for the map. Communications should be addressed to Mr. Louis Carr at the council offices, Northwood, Middlesex.

LONDON ROADS AND TRAFFIC.

The need of prompt attention to the question of main arterial road from London is referred to in the annual report of the London Traffic Branch of the Board of Trade. Within the last year or two, says the report, some of the lines originally selected for new roads have been blocked by building developments, and no time is to be lost if other sections of roads on the outskirts are to be saved from the same fate.

The matter of the most pressing urgency is the co-ordination of road improvement and town planning schemes round London. The cost of improvement while development is in progress is but a fraction of the cost involved if road improvement has to be undertaken after the area is built over.

As regards congestion of the traffic in London, the greatest increase in the number of vehicles has taken place in the zone from 6 to 9 miles from St. Paul's Cathedral. Horse-drawn vehicles continue to be supplanted with remarkable rapidity by the mechanically propelled, and there is an increase in the number of street accidents. The total number of street accidents in London in 1913 was 25,839, as against 22,270 in 1912.

The increase in accidents is offset by the fact that people travel much more than they used to. In 1904 the journeys per head of the population were 150·5; in 1913 they had risen to 271·5. The rate of increase in journeys and in accidents is about equal. The proportion of fatal accidents is increasing rapidly, and this is due to the multiplication of motor vehicles. Motors are twice as likely to cause accident as horse vehicles, and the proportion of fatal accidents is three or four times greater.

The motor 'bus is still the most dangerous type of vehicle, but its fatal effect has largely decreased owing partly to the introduction of the side guards. Motor cabs and cars are the next most dangerous class. Electric trams come next, though their fatal effect is very low, owing to the efficiency of the life guards.

Road traffic continues to increase at the expense of the railways. Whereas in 1909 60 per cent of the total number of passengers carried went by road and 40 per cent by rail, in 1913 68 per cent went by road and 32 per cent by rail.

Local Government Board Appreciation.—At the last meeting of the Bishop's Stortford Urban District Council the Highways Committee reported the receipt of a letter expressing the Local Government Board's appreciation of the work which had been done in the district during its occupation by the troops. The Chairman remarked that the communication was highly gratifying, and a member observed that it showed that the surveyor (Mr. Robert S. Scott) had done his duty.

Works Projected by Local Authorities for 1915.

The Great War has had a [illegible] on a good deal of municipal work contemplated in these islands during the coming year. In particular building operations, owing to the [illegible] of materials and the [illegible] labour, have been [illegible] during the past few months, and even [illegible] as an inevitable result of the crisis. It is natural that road works and in particular main road [illegible] should be postponed, and [illegible] pleasure resorts [illegible] to the [illegible] of [illegible] and the [illegible] of building [illegible] will be [illegible] by the [illegible] of progress and enterprise at seaside resorts, under the [illegible] in spite of the [illegible] of the times, the [illegible] of the [illegible] and [illegible] growing requirements of the public. This is but a [illegible] of the [illegible] for 1915, [illegible] pages, but it would be incomplete if we failed to [illegible] our numerous correspondents who have so generously enabled [illegible]

Abergele and Pensarn (Mr. W. E. [illegible], engineer and surveyor to the urban district council).—[illegible] Parish Council, the [illegible] Pensarn will be [illegible]

Abersychan, Mon. (Mr. [illegible], M.I.M. [illegible], engineer and surveyor to the urban district council).—[illegible] Pontnewydd to Abersychan, estimated to cost £[illegible], [illegible] Parish Council, the [

be proceeded with, and several schemes for improving and widening portions of the main roads will be carried out. Further consideration will be given to the provision of public baths and junior secondary schools, and to the substitution of bridges and subways for the existing level crossings over the railway. Many new streets will be made up under the Public Street Works Act, 1892, and the existing horsed dust-carts may be replaced by electrically propelled vehicles.

Barnet (Mr. W. B. Chancellor, engineer and surveyor to the urban district council).—Several private street works will be executed; municipal offices and underground conveniences, together with thirty-two workmen's dwellings and flats, will be erected; a considerable quantity of tar-macadam and Trinidad asphalt will be laid down on the principal roads, and the town planning of Totteridge and Arkley will be proceeded with. The council will also have under consideration the sewering of Totteridge, and the putting down of an ejector station, refuse destructor and pumping station.

Barnsley (Mr. J. Henry Taylor, M.Inst.C.E., borough surveyor and waterworks manager).—It is not anticipated that there will be a considerable amount of public works carried out within the borough. There are several important projects in hand and in contemplation, but whether they will fructify into actual being is uncertain. The corporation have accepted designs for a new town hall, and the architect has the preparation of the specification in hand. The cost of the building will be anything from £25,000 to £30,000, including the furnishing. The site has been purchased at a cost of about £10,000, and the citizens are looking forward to the time when they will have a building worthy of the town in which to carry on municipal work. The two most important buildings now in progress in the town are the Sheffield Banking Company's premises and the new Alhambra Theatre. The latter is of a pretentious character, and will probably be one of the finest buildings in the district. Road widenings have been sanctioned by the Road Board, and are now being taken in hand at a considerable outlay. Numerous private street improvement works are in hand, and others will follow during the year, but to what extent it is not at present possible to say. There are also extensions of the waterworks sanctioned, but these will be delayed as long as possible under present circumstances. The building trade is very slack, and the prospects are anything but rosy. The construction of a soldiers' camp at Silkstone for the 1st Barnsley Battalion, at an outlay of about £11,000, is now practically completed.

Barnstaple (Mr. F. Y. Saunders, M.R.San.I., borough surveyor).—The year will be a very quiet one so far as this borough is concerned from the point of view of municipal constructive work. Nothing is projected beyond the ordinary routine work of road repairs. Respecting buildings, it is most probable the county council will erect the new science and art schools on the Strand site. The usual tar-painting of highways will be carried out—some 51,000 sq. yds.

Barrow-in-Furness (Mr. Arthur Rae, borough engineer and surveyor).—It is expected that the swimming baths in Abbey-road will be completed in the spring, at an estimated cost of £16,000, and that the erection of a new public library will be commenced, the cost of which is estimated at about £13,000. Two elementary schools now in course of erection will, it is anticipated, be completed at an estimated cost of £26,500, and it is expected that a new secondary school will be put in hand, at an estimated cost of £35,000. A further widening and improvement of Fairfield-lane, and the widening and improvement of a portion of Hollow-lane will be carried out, at an estimated cost of £1,625. The Vickerstown Park and land adjoining on Walney Island, a total of about 8 acres in extent, will be taken over by the corporation, and the laying out completed. Work in connection with the further laying out of the public park on the mainland will be put in hand, and the laying out of a small recreation ground on Barrow Island will probably go forward. The reconstruction of the road crust of Abbey-road with natural asphalt, and the completion of similar work in Duke-street will be executed at an estimated cost of £10,000. Street improvements will be made at the junction of Rampside-road and Roose-road; also at the corner of Holbeck-road. A complete plant for the manufacture of 500,000 cub. ft. of gas per day will be installed on the site of the new branch gasworks in the Salthouse district of the borough. The total amount of the borrowing powers obtained is £75,000. This work will be carried out jointly by the borough engineer and the gas and waterworks manager. Private street improvements and the reconstruction of ordinary water-bound macadam roads with tar-macadam, together with tar-spraying work, will be in progress as usual. An installation of Deacon's waste-water detecting meters will be completed at an estimated cost of £2,000. The supervision of this work will be carried out jointly by the borough engineer and the gas and water works manager. Permanent tripe-dressing and gut-scraping sheds will be erected at the public abattoirs, the estimated cost of which is placed at £1,700.

Basingstoke (Mr. F. Reginald Phipps, Assoc.M.Inst.C.E., F.S.I., borough surveyor and waterworks engineer).—There are no works of great importance actually decided on for 1915, but many matters are under discussion. The improvement or extension of the sewage farm is urgently needed, the billeting of over 5,000 soldiers during the winter having strained its capabilities to the utmost. The provision of covered swimming bath and slipper baths is being strongly advocated, as also is the erection of more lavatory accommodation throughout the town. The building of twenty-eight houses for the working classes is in progress, and will be completed about April, when the question of further building will be considered. About 10 miles of roads will be tar-sprayed, and various improvements carried out on main and district roads, one being the completion of [illegible] widening, for which a loan was obtained.

Batley (Mr. Oscar J. Kirby, Assoc.M.Inst.C.E., borough engineer).—Chief among the works to be done this year are the following, viz.: The tar-paving of about 3 miles of streets, extra sizes to the electricity generating station; the laying of an outfall sewer from the district of Howden Clough, Howley Beck, and Lamparside; the widening of Whitechapel-road from Mount Pleasant to the centre of the town, and five streets to be made up under the Public Health Act, see 150.

Bedale (Mr. T. W. Metcalfe, surveyor to the rural district council).—In addition to the ordinary routine work, several minor road improvements are contemplated. The question of extending the sewers at the village of Kirkby Fleetham is under consideration. It is not anticipated that anything of considerable importance will be undertaken during the ensuing year.

Bedfordshire (Mr. W. H. Leete, Assoc.M.Inst.C.E., M.R.San.I., county surveyor).—It is not anticipated that there will be any special works apart from the ordinary maintenance and surfacing-improvement works on main roads.

Belper (Mr. Robert C. Cordon, engineer and surveyor to the rural district council).—During the year 1915-16, in addition to the ordinary work on the 162 miles of roads, the following works are projected: Construction of sewers and sewage disposal works for the township of Crich, estimated cost £12,250; the erection of a bridge over the river Derwent at Alles[illegible] estimated cost of bridge, £8 if with £2,000 sewers and sewage disposal works in the parishes of Denby and Horsley Woodhouse, alterations to sewage disposal works at Mapperley; the construction of a new culvert at Kilburne, estimated cost £120; and improvement to several lengths of roads by widening and removing dangerous corners.

Bethnal Green (Mr. A. E. DARBY, ASSOC.M.INST.C.E., borough engineer and surveyor).—During the year the 1913-15 programme of road construction, amounting to £28,868, toward the cost of which the Road Board have made a grant, will be completed. Further reconstruction and carriageway to be carried out include the repaving with creosoted wood blocks of a portion of Hackney-road, at an estimated cost of £1,000. The widening and improvement of Columbia-road and also the widening of a portion of Hackney-road prior to the re-erection of buildings, plans of which have been approved by the London County Council. The council have received sanction to borrow the money for the laying down of a pulsometer pump at the sewage outfall works, which will include granite paving and road reconstruction works, and the strengthening of Twig Folly Bridge. The electrical substations in connection with the electric scheme. The installation of additional slipper baths in the public baths. The decoration of the town hall and offices. The depot stables are among the constructional works to be carried out. Preliminary plans are also in preparation for the new Carnegie Public Library, which is to be erected at a cost of £14,000.

Bexhill (Mr. GEO. BELL, ASSOC.M.INST.C.E., borough engineer and surveyor).—No work of any magnitude is at present projected in the borough for 1914. The work under consideration, which may or may not be carried out during the year, is a new permanent hospital scheme for the borough, the extension of sewer outfall beyond low water for a distance of about 400 ft., with necessary chambers to receive tanks, a surface water drainage scheme with storm-water overflow, on the Cooden estate, and several private street improvement works.

Bilston, Staffs (Mr. VINCENT TEALE, surveyor to the district council).—A commencement, early in the year, will be made on the Holyhead-road improvement scheme, towards which the Road Board have granted financial assistance. The installation of electrical power and new pumps, machinery at the sewage works and the extension of the tipping will be completed. Other schemes which will be taken in hand are the widening of the Wrenbury and Library buildings, fever hospital and cemetery; additions to the market hall; the provision of a public convenience for both sexes and the putting down of an electrical sewage pumping plant. Demolition of insanitary property is to be carried out. A scheme has been prepared for a hamlets scheme. The abolition of the pan and substitution of the water-carriage system of sewerage will be further extended. The council have revised their present scale of water charges and hope to issue the new early in the year. The duplication of the trunk water main from Goldthorn Hill service reservoir is to be carried out, the erection of a new [illegible] for is prominently before the council. Considerable improvements will be effected on the district roads, and experiments in tarmetting the [illegible] probably carried out. Mains, with [illegible] making in for the 1892 Act about 120,000 yds. of road and street [illegible] forms, and the usual repairs work will be done with as previously.

Birkenhead (Mr. CHAS. BROWNLOW, M.INST.C.E., borough engineer and surveyor).—Tenders are now being invited for the erection of a [illegible] at Thingwall. The council have under consideration the erection of an elementary school to accommodate about 900 pupils, and a large scheme for the building of houses for the working classes, and it is expected that the erection of these buildings will be commenced during the early part of the year. A considerable amount of renewal of street paving and sewer reconstruction will also be undertaken.

Birstall (Mr. T. H. HAILSTONE, M.I.M. AND C.E., M.R.SAN.I., A.I.S.E., surveyor to the urban district council).—In addition to the general routine work, the council have decided upon a town planning scheme, and maps Nos. 1 and 2 are now being prepared. It is also proposed to carry out sewer extensions, and to make up streets under the Private Street Works Act.

Birmingham (Mr. HENRY I. SMITH, M.INST.C.E., city engineer and surveyor).—Sewerage: Wylde-Erdington main sewerage; estimated cost £28,000 [illegible] Brook sewerage; estimated cost £17,000. Markets: [illegible] £4,000 [illegible] put in hand. Roberts-road sewer- [illegible] £4,000 [illegible] relief valley sewer across private land at Dogpool [illegible] during very heavy rainfall in Upper Pershore-road district. The question of enlarging the Hockley main sewer below Avenue-road is also a matter which might be brought up again at any time. Private Street Improvements: Grove Hill-road, Handsworth [illegible] £90. [illegible] Handsworth [illegible] £15. [illegible] Handsworth [illegible] £632. [illegible] Handsworth [illegible] £611. Pollard-street, Handsworth [illegible] £1,600. [illegible] King's Norton. Building Works: Police station, Bristol-street; new fire station, Aston; extensions [illegible] Lighting dept. [illegible] Coventry-street New-street Paving. Hall Green-road, Durax paving: High-street, Harborne, wood paving; Ledsam-street, granite and wood paving; Ryland-street, granite and wood paving; Booth-street, Hand-worth, granite paving. Widenings: Marsh-lane, Erdington; Brookvale-road, Erdington Harborne-road, Edgbaston; Lakey-lane, Hall Green; Lordswood-road, Harborne; Shattmoor-lane, Hall Green; Reddings-lane, Hall Green; Oxhill-road, Handsworth; Wellington-road, Handsworth; War- [illegible] road. [illegible] Perry-road and W... lane.

Blackpool (Mr. JOHN S. BRODIE, M.INST.C.E., borough engineer and surveyor).—The contemplated works include a new covered-in swimming baths for school children; an open-air swimming bath, 400 yds. by 200 yds., on the foreshore; two new bowling greens; two recreation grounds; three large underground con- [illegible] sumption sanatorium for thirty-six beds; the reconstruction of three main arterial roads; the widening [illegible] Bloomfield-road; the making up of over twenty new private streets; and the completion of the new North End Promenade extension.

Bognor (Mr. OSWALD A. BRIDGES, M.R.SAN.I., engineer and surveyor to the urban district council).—The popularity of this rising seaside resort has increased by leaps and bounds, and the urban district council are almost unanimous in a desire to keep up with its requirements, and to make it the one prominent ray of sunshine on the South Coast for visitors. They are consequently spending vast sums of money in developing the town. This year an important widening of the Marine-drive and promenade opposite Lansdowne Mansions, west of the pier, will be effected, at a cost of £9,000. This scheme entails encroaching upon the sea by going out 45 ft., to which there has been some objection, and the council therefore decided to call in an expert. Prof. Matthews, ASSOC.M.INST.C.E., late borough engineer of Bridlington, was consulted, and he agreed with the scheme in its entirety as drawn up by the surveyor. The new outfall scheme at the sewerage works will be commenced in March; it is estimated to cost £10,000. The provision of workmen's dwellings has had the council's attention for some time, and forty-one houses have already been erected in Sheepwash-lane and Grevilts-lane. A scheme for 150 additional cottages is about to be started. The rents are 4s. 6d., 5s. 6d., and 7s. 6d. The cheaper houses have only one living-room and scullery on the ground floor, and three bedrooms: the 5s. 6d. houses have a parlour, kitchen, scullery, washhouse on the ground floor, and three bedrooms upstairs, the 7s. 6d. houses are really small villas for mechanics, containing parlour, kitchen, scullery on the ground floor, three bedrooms and a bath-room upstairs. The cost of No. 1 cottage, let at 4s. 6d., is £150; No. 2, let at 5s. 6d., £206; No. 3, let at 7s. 6d., £280. The work of building is being done department-

ally under the supervision of the assistant surveyor, Mr. F. B. J. Stephens.

Bolton (Mr. E. Ll. Morgan, Assoc. M.Inst.C.E., borough engineer and surveyor).—Apart from the ordinary work, the department have in hand at the present time the widening of St. Helens-road, including the doubling of the tramway track between Hulton-lane and Four Lane-ends, and a new connecting road between Church-road and Chorley Old-road, the estimated cost of these two schemes amounting to £22,000. In addition, it is proposed to complete the improvement of Deansgate (one of the principal thoroughfares in the borough), and the widening and improving of Plodder-lane and Hulton-lane, at an estimated cost of £21,000, together with the making up of a number of private streets under sec. 150 of the Public Health Act, 1875, the cost of which is estimated at £15,000. It is also proposed to reconstruct the tramway tracks in Deansgate, Marsden-road, St. George's-road, Knowsley-street, Bridge-street, and Higher Bridge-street, at an estimated cost of £11,036. Extensions are proposed to be carried out to Astley Bridge cemetery, and the council have under consideration the provision of a boating lake and playing fields.

Boston, Lincs (Mr. G. E. Clarke, M.Inst.C.E., M.I.Mech.E., borough engineer and surveyor).—Owing to the war no large works will be carried out. The usual amount of tar-macadam will be laid, and a refuse destructor erected; otherwise expenditure will be curtailed as much as possible. Harbour and Dock. —The same remarks apply here. The new ice factory, transit sheds, hydraulic coal hoist, cranes and new sidings have been postponed. Since the outbreak of war Mr. Clarke has been engaged in many important matters in connection with the naval and military authorities.

Brecknock (Mr. B. L. Pritchard, surveyor to the rural district council).—A scheme of sewerage is to be carried through for the village of Llangorse, and a scheme of water supply for the village of Yscythrog is under consideration. The question of housing in the district is receiving special attention, the council having been called upon to provide additional houses at Senny Bridge, Talybont, and Cray.

Bridgwater (Mr. F. Parr, Assoc.M. Inst.C.E., borough surveyor and waterworks manager).—The works proposed to be undertaken by the town council during the ensuing year are a consideration of the water supply and an extension of the main sewers in the Chilton district. This, with the routine work in the repair and maintenance of roadways, footpaths, and maintenance of the property belonging to the town council, will embrace all the public works likely to be undertaken.

Bridlington (Mr. C. G. Bradley, borough engineer and surveyor).—The works proposed to be carried out in Bridlington during 1915 include the widening of Hilderthorpe-road, also of Forty-foot-road, and a portion of St. John's-street; the erection of a refuse destructor, the building of ten workmen's dwellings in Portland-place, the [illegible] of a portion of the wood blocks in High-street, private street works in several streets, and the laying of two new sewers in the borough.

Bristol (Mr. Lessel S. McKenzie, Assoc.M.Inst.C.E., city engineer). Contracts are in operation for the erection of one nursing block and two convalescent blocks for the treatment of tuberculosis for seventy patients, together with administration building, and also for the erection of a swimming bath and slipper baths. It is anticipated that extensive additions will be made at the fever hospital, also to the workmen's lodging-house, and a lodging-house will be provided for women. A ferro-concrete water-storage tank of 40,000 gallons capacity is also to be erected. A large amount of tar-spraying will again be carried out on macadamised roads, and a heating, drying and mixing plant has been ordered with a view to laying down bituminous roads by direct labour.

Briton Ferry (Mr. H. Alex. Clarke, engineer and surveyor to the urban district council). — The second housing scheme of sixty-two workmen's dwellings was completed at the end of last year. This will make in all 113 dwellings at a total cost of £28,735, which includes cost of land, sewer and road construction. Additional water mains have been constructed at a cost of £2,700, and many lengths of streets and secondary roads added, and also minor works of sewerage. The sanction of the Local Government Board has been received for laying out 6 acres of ground for a public park, at an estimated cost of £2,050. It is also proposed to extend the area of the public cemetery.

Buckfastleigh (Mr. Wilfrid J. Goode, M.I.M. and C.E., engineer and surveyor to the urban district council).—During the year the scheme for the erection of artisans' dwellings, for which a loan of £3,151 has been sanctioned by the Local Government Board, will in all probability be proceeded with. Extensions of the water supply now being carried out at Buckfast will be completed in the early part of the year, and further extensions are to be made in Oaklands-road. Street improvements, involving the demolition of cottages at Waterman Corner, will be dealt with, the Local Government Board having held an inquiry for sanction to this work. Tar surface treatment and macadam will be laid down more extensively.

Bucklow (Mr. R. Curtis Cordon, M.I.M. and C.E., highway surveyor to the rural district council).—In addition to the maintenance of 207 miles of paved and macadamised roads, various improvements are in prospect. It is anticipated that ferro-concrete bridges will be built at Dunham Massey and Mobberley, and a length of concrete tube culvert put in at Millington. Road widenings will be carried out in several townships, and lengths of surface-water drains are required. A large area of granite and grit sett paving and a quantity of tar-macadam will be laid during the year.

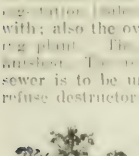
Burley-in-Wharfedale (Mr. Harry Riding, surveyor and inspector, gas and waterworks manager, to the urban district council).—The mechanical water-filtration plant contemplated last year is now nearly completed, and will be put into use early in the year, and further work in connection with the scraping of water mains will be taken in hand. During the Spring season about 35,000 super. yds. of tar-spraying will be executed, and the policy of substituting tar-macadam for ordinary water-bound macadam roads will be continued. Owing to the success of Glutrin-bound granite roads, the council propose to put down two further lengths. Further extensions at the sewage disposal works in the form of [illegible] beds are to be put in hand, and a new 12-in. outfall sewer, and a 1,000-gallon flushing chamber will be constructed in connection with the Allotment Gardens Society, who are about to sewer their property.

Burnham, Somerset (Mr. Wm. H. Crowins, [illegible] and area [illegible] to the urban district council). The principal works which will be carried out this year are low-level sewerage works in the new area recently added to the urban district. These works, which comprise stoneware pipe sewers, cast-iron rising and air mains, ejectors, compressors, and electric motors have just been commenced. Beyond the above and the ordinary routine work, nothing of importance is at present in contemplation.

Burnley (Mr. G. H. Pickles, M.Inst.C.E., borough engineer and surveyor).—The following is the list of the works projected for the coming year: New schools; new roadway through Towneley Holmes; tramway extension (lines and depot); private street works; main roads; new bowling green and [illegible] Scott Park; additions to sewers and sewage outfall works; new recreation grounds at Barden-lane and Habergham; formation of Queen Victoria-road; formation of roadway and culvert at Sept Clough; additional office at stationery stores; housing scheme; and town hall extension.

Burntisland, Fife (Mr. J. A. WADDELL, M.I.M. AND C.E., burgh surveyor and sanitary inspector).—The erection of new works on a site adjoining the burgh, by the British Aluminium Company, Limited, London for treating the raw material used in the course of their manufactures, is expected to cause great development and extension of the burgh. The works, as projected, are expected to cost several hundreds of thousands, and to provide employment for from 300 to 400 workmen. A start has been made with the preliminary works of construction, and the works are to be completed at an early date so that advantage may be taken of the disorganised condition of the German trade in aluminium to cut into some of the markets of the German manufacturers. In view of the demand for housing accommodation for the workmen, which will thus arise, the town council are arranging to feu about 7 acres of ground on Rossend estate, choosing the works for artizans' dwellings, and this will necessitate the construction of roads and the provision of sewerage and water supply for the estate.

Burton-upon-Trent (Mr. [illegible] LANSAM, M.INST.C.E., borough engineer and surveyor).—[illegible] the duplicate sewage rising main, [illegible] 21 inch to the sewage farm, reducing thereby [illegible] to convey the Cross Mills Steam, the river Dove, and the crossing of the North Staffordshire Railway will be undertaken at the [illegible] Extensions to the pumping station boiler [illegible] will be provided with; also the overhauling of the whole of the pumping plant. The extension of the town hall will be finished. The [illegible] Hay Dyke [illegible] sewer is to be undertaken, and the extension of the refuse destructor completed.



Bury, Lancs (Mr. J. ARMSTRONG SETTLE, ASSOC.M.INST.C.E., borough engineer and surveyor).—The work to be undertaken during the [illegible] during 1915 will be as follows:—Completion of extension of tramways at Rochdale Old Road and Walmersley; [illegible] to provide parks or recreation grounds; [illegible] hauling sheds, extension of the [illegible] and the construction of new [illegible] roads, improvements and widenings. An offer of a townsman to erect workhouses and baths has been accepted by the town council. Several important schemes are held in abeyance owing to the national crisis.

Buxton (Mr. F. LAWRENCE, engineer and surveyor to the urban district council).—The work contemplated for the year 1915 on the extension of the natural mineral water supply is [illegible] at a cost of £12,000. The [illegible] Buxton Baths with an [illegible] Bill [illegible] the re-instatement of Spring Gardens, [illegible] rock, [illegible] £1,200, and the [illegible] pleasure grounds. Schemes for the erection of public conveniences at various points in the district [illegible] Road widenings and improvements will be carried out, and the work of converting ordinary water-bound macadam roads to basalt tar-macadam will be continued. Private street improvements and the laying of kerbing are also to receive attention. The sewage filter-beds are to be emptied and re-furnished with new [illegible] machine-screened clinkers from the destructor works, being utilised for this purpose. It is hoped that during the present year Buxton will attain the position of a borough as a result of its petition for a Charter of Incorporation, with the adjoining urban district of Fairfield.

Cannock (Mr. ROBT. BANCHARD, engineer and surveyor to the urban district council).—The extension of the sewage disposal works, at an estimated cost of £12,270, is in course of construction, and will be completed by the summer. Various other contracts for the provision of sewers, road improvements, and underground convenience will be completed during the early part of the year. A housing scheme for the erection of forty-four houses will be carried out during the year. The provision of an isolation hospital is receiving consideration by the council.

Cambridge (Mr. JULIAN JULIAN, borough engineer and surveyor).—The programme of work for 1915 is not yet made, but it is anticipated that it will be chiefly concerned with maintenance work and special work already arranged. Cambridge will undoubtedly be financially hard hit by the war, and it is very unlikely that the council will embark on any such schemes at the present time. The following will probably be proceeded with during the next few months—viz.:—Additions to the guildhall and free library; footbridge over the Cam; several additions to the housing scheme; extension of shedding at the central depot; and one important street improvement (Jesus-lane).

Cardiganshire (Mr. F. E. OWEN, M.I.M.C.E., surveyor, [illegible] Division).—The chief works proposed in the [illegible] Division of the county are as follows—viz.:—The strengthening and surfacing with [illegible] the Llandilos to Aberystwyth main road, and extending from Gogenau village (8 miles from Aberystwyth) to Maes Bangor Arms hotel. The laying of 1¼ miles of tar-macadam on the same main road, commencing at the junction of the Aberystwyth borough boundary, and extending to the second milestone. It is proposed to obtain the tar-macadam, as well as the ordinary granite, from the Minffordd quarries of the Pwllheli Granite Company, Limited, of 44 High-street, Runcorn. The strengthening of the foundations of various sections of the road between Llangeithe and Talsarn with local stone. This road is off the beaten track of tourists. The widening and improvement of several dangerous and narrow corners. It is proposed to do away with the present hedges, and substitute post and wire fence, to allow of a better and open view. The strengthening in ferro-concrete of the weak arches of Penybont Bridge, and the improvement of the steep gradient leading thereto. This bridge is situated between Llanbadarn Fawr and [illegible] miles from Aberystwyth.

Cardiganshire (Mr. DAVID DAVIES, surveyor, [illegible] Division).—The projected works include strengthening and surfacing the road Cardigan to Cenarth, from Manorafon to Cenarth, about 66,000 super. yds.; new bridge at Rhydybeillen, and a new bridge at Rhyd. Both bridges will be in the rural district of Aberayron.

Carmarthenshire (Mr. R. W. JONES, M.I.MUN.E., county surveyor).—Further progress will be made with the four years' scheme of road reconstruction under the Road Board grants, which include widening, strengthening, and surfacing 25 miles on two of the chief road arteries in this division. The whole of the [illegible] be carried out by direct labour. Important road widenings are contemplated to be [illegible] between Bury Port and [illegible] A new bridge to replace the present double arch bridge is proposed to be erected on the mail road between Carmarthen and Bankyfelin. No [illegible] public buildings and police [illegible] necessary repairs.

Carshalton (Mr. W. WILLIS GOLDSMITH, M.INST.C.E., M.I.M.E.A., surveyor to the urban district council).—The council will during the ensuing year carry out the following works, viz.:—Widening and improving Woodmansterne-road (work for unemployed), at a cost of £1,100, [illegible] (contractor), building a pebble convenience in the Carshalton Park, for both sexes, at a cost of £600, four cottages at the Nightingale (keepers and employees), £1,100, seven roads under the Private Street Works Act, 1892, at a cost of £4,300; and the surface treating of all the roads in the council's area, about 200,000 sq. yds., at a cost of £1,000. The construction of an open-air swimming bath in the park is still under consid-

tion, the question of temperature being the burning subject.

Cheadle and Catley (Mr. F. R. GIBBINS, B.SC., ASSOC.M.INST.C.E., engineer and surveyor to the urban district council). Further lengths of resurfacing main roads will be taken in hand under Road Board grants. The whole of the main roads will be tar-sprayed in the early part of the year. Various private street works are contemplated, also road widenings and improvements in ordinary highways. A new bowling green at the recreation ground will be completed. Applications will be made for approval of town planning schemes for two areas—one of 4,232 acres, and the other of 471 acres.

Chelmsford (Mr. PERCIVAL T. HARRISON, ASSOC.M.INST.C.E., borough and water engineer).—During the past year the council have completed their housing schemes, totalling 144 houses, sunk two boreholes, 540 ft. and 357 ft. deep respectively, erected cottages for employees, and carried out extensions to sewers, water mains, and new street works. Works in progress, or already decided upon, for the present year include two new waterworks pumping stations—one at Galleywood and the other at Admiral's Park—slipper baths, extensive road resurfacing under the Road Board, wood block paving, several road widenings, extension of sewage farm, and the covering in of reservoir and filters. The year will probably see the completion of the plans for remodelling the sewerage and sewage disposal works of the borough. The council are also considering schemes for new municipal offices, a bridge over a river, new road connecting Springfield Ward with the railway station, refuse destructor, and town planning. It is proposed to promote a Bill in the next Session of Parliament for the acquisition of the gasworks. The billeting of large bodies of troops in the borough and neighbourhood has necessitated the carrying out of much work in connection with water supply and sanitation.

Cheltenham (Mr. J. S. PICKERING, M.INST.C.E., borough surveyor and water engineer).—The corporation are making a special effort to bring before the public notice the features of the town as a health resort and spa, particularly in view of the German and Austrian spas being closed to the British people. A Traders' Association has been formed, and they are bearing the expense of a band which performs daily at the Central Spa. A contract has been entered into between the corporation and the United Chemists' Association, Limited, under which the corporation supply mineral water from their wells, which the company concentrate and bottle as an aperient. A large demand has already been made for the supply of this water throughout the country, and early in the new year the pumping plant will have been completed ready for supplying the water. The new municipal offices are nearing completion, and will be ready for occupying in the autumn of 1915. The new sewage purification works have been carried out at a cost of about £40,000, and will be in full operation early in the year. The laying of a new trunk main to improve the pressure of water in the Leckhampton district, a distance of about a mile, is to be proceeded with. The committee have decided to lay a further area of 6,000 sq. yds. of wood paving in Lower High-street. The ordinary water-bound method of road construction has been almost abandoned, and tar-macadam construction substituted. This process will be further extended during the year.

Cheshunt (Mr. J. E. SHARPE, engineer and surveyor to the urban district council). The question of the water works will engage the consideration of the council. The yield from the existing well and pumping station is not sufficient to meet requirements, and a large quantity of water has to be bought in bulk from the Metropolitan Water Board. The question of providing a new source of supply by sinking a new well, and the erection of a new pumping station, will no doubt be considered. The resurfacing with a bituminous carpet of such portion of the London and Cambridge main road which lies within this district will probably be undertaken. This is part of the scheme for improving the surface of certain trunk roads in the county, and leading to London. The area in this district which will be dealt with is about 60,000 super. yds. During the coming year it is intended to make some provision for small-pox. A site has been acquired, and probably a hospital of a temporary character will be erected.

Chiswick (Mr. EDWARD WILLIS, ASSOC.M.INST.C.E., F.S.I., M.R.SAN.I., engineer and surveyor to the urban district council).—The effect of the war has been to diminish the work that the council would probably have undertaken, but it is anticipated that upwards of a mile of highways will be converted from granite surface to creosote softwood paving, an estimate of £20,000, including assistance from the Road Board, having been already approved. Several thousand yards of surface-water sewers will also be added to the system which has already been sanctioned, the idea being to carry out extensions each year until the drainage scheme has been completed. One or two private streets will be made up during the year, most of this work having been brought up to date in past years. One large refuge will probably be provided in the High-road, as the tramway and omnibus traffic have considerably increased. A very extensive widening in Burlington-lane is being carried out with raised rockeries on each footpath, planted with trees and shrubs. Further widenings under the Chiswick Urban District Council Act, 1911, will also probably be executed during the year to the extent of several thousand pounds. It is intended to further extend the laying out of the Commons, but not to any very great extent. Somewhat extensive alterations will be carried out at the Holme Court Industrial School, and it is also probable a new school or extensive alterations may be required. The most important matter now before the council is the proposal to form an extensive golf course with a promenade for upwards of half the river frontage of Chiswick, but it is feared the war will prevent this improvement being effected at present.

Chorley (Mr. GEORGE H. HOPKINSON, borough surveyor). The works projected include reconstruction of part of the main road (Bolton to Preston); granite setts on concrete foundation, estimated cost £4,700; completion of Tatton recreation ground; and private street works for several streets and passages, for which Local Government Board sanction has been obtained to a loan of £3,963. Other works will probably be affected by the war, and it is difficult to forecast the improvements that may be dealt with.

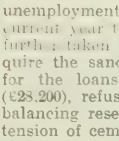
Clacton-on-Sea (Mr. D. J. BOWE, engineer and surveyor to the urban district council). During the past year, which has been one of much progress in this seaside resort, a number of interesting works have been completed, chief among them being the bandstand and entertainment pavilion, which was carried out by administration by the surveyor, at a cost, the building alone, of £13,000. The Pier Approach property has been demolished; the cliff sloped, planted, and formed into rock gardens, and the East and West Promenades linked together by a ferro-concrete bridge of 60-ft. span, and 20 ft. between the parapets, at a cost of £6,000. This bridge is in Early Italian Renaissance, and is a unique example of ornamentation in ferro-concrete construction. During 1915 two subsidiary concrete groynes are to be built, at a cost of £2,500, thus completing the scheme of the surveyor four years ago of groyning the whole of the foreshore. This work is amply justified by the results now being obtained. The sea wall and promenade is to be extended in the spring to the west boundary, at a cost of £9,150, while a bathing chalet, to accommodate eighty bathers of both sexes, will be constructed at the east, at a cost of £1,000. Several roads will be made up under the Private Street Works Act, and the council will consider a full report of the surveyor on the sewerage system of the district, including a new outfall sewer to the extreme west of the district.

Cleethorpes - with - Thurnscoe (Mr. C. H. WAITHMAN, ASSOC.M.INST.C.E., M.I.M. AND M.U.E., engineer and surveyor to the urban district council).—During the year the Cleethorpes sewage disposal scheme will probably be completed. This work, which was commenced in April, 1911, will probably cost about £75,000. The scheme provides for the carrying of about 2 million gallons per day from Cleethorpes to Thurnscoe, a distance of about 7½ miles, by means of a 12-in. to 24-in. pipe sewer. At Thurnscoe a concrete storage tank, with a capacity of 1,000,000 gallons, the reconstruction and lengthening of the southern outfall, and the building of the pumping station and their equipment are being carried out. The whole of this work has been carried out under the control of the consulting engineer, Mr. J. S. Allen, M.INST.C.E. The new refuse destructor was commenced in May, 1914, and is now in operation. The plant, which is by Messrs. Manlove, Alliott & Co., Nottingham, consists of four cells, so designed that they form two separate units, with provision for the ultimate construction of two additional cells. The cost of the building, cells and shaft is £6,260. The council are constructing a concrete inclined roadway by direct labour as a distress relief work at an estimated cost of £250. The projected works for 1915 include the widening and improvement of three of the most important roads in the district, at an estimated cost of £10,000. This work is intended to act as a distress relief work, and will probably be commenced in February. The Kingsway Pavilion is to be improved, at an estimated cost of £[illegible]. A [illegible] and [illegible] and a [illegible] road. A bandstand is to be erected in the Sydney Park. The council have also under consideration the question of the provision of a marine lake (20 acres of water surface), with gardens, sea wall, swimming baths, and boat-house. The extension of Sydney Park by the addition of 6 acres, and the laying out of the Central West Recreation Ground [illegible] will probably be carried out during 1915. The council have just received sanction to a loan of £10,000 for the purpose of laying electricity cables in the main streets.

Clydebank (Mr. [illegible], burgh surveyor and master of works).—The second of the two new bridges erected over the Forth and Clyde Canal is expected to be opened for traffic early in spring. Two widenings of Kilbowie-road to 60 ft. are contemplated. The [illegible] opposite Singer's works, is [illegible] yds. long, and entails the erection of a retaining wall in reinforced concrete, and the widening of three railway bridges at a total cost of £4,500. The second is at the north end, near the burgh boundary, and is over 600 yds. long. No great engineering problems are met with here, a general improvement of the line and gradients of the road suitable for the proposed tramways to Duntocher being the main work. This widening is expected to cost about £2,500. Other new roads and widenings have been proposed in connection with the provision of work for unemployed, including the widening to 50 ft., and raising of Park-road to Duntocher-road, the continuation of Stevenson-street to Albert-road, and the formation of three of the roads proposed under the town planning scheme. It is also proposed to cover in the Boquhanran Burn by the construction of a ferro-concrete culvert. Plans have been prepared in connection with the housing scheme of the corporation, the houses comprising a room and kitchen, and three rooms and kitchen, with bath and scullery. Owing to the great scarcity of houses in the burgh, an early start is expected to be made with the construction. The proposed sites, which are in the Radnor Park district, are very healthy, and command a fine view of the surrounding country. The population of the burgh is 45,000.

Colchester (Mr. HAROLD COLLINS, ASSOC.M.INST.C.E., borough engineer and surveyor).—The substitution of wood paving for water-bound and tarred-macadam and granite-sett paving in High-street, Head-street and Crouch-street will be completed in the early part of the year. The scheme for the replacement of the existing water-bound macadam in London-road, Lexden-road, Crouch-street (part of), East-hill, East-street, Ipswich-road, and Harwich-road with bituminous macadam will be taken in hand, a grant of £[illegible] has been made for the work by the Road Board through the county council. The [illegible] Hythe Quay and [illegible] Colchester, with a [illegible] has been carried out at a cost of about £2,000. By [illegible] this work [illegible] £1,000 [illegible] the [illegible] of [illegible] the [illegible] have been completed, but has been [illegible] owing [illegible] Temporary [illegible] have been erected by the War Department for many thousands of soldiers, and the drainage arising [illegible] required the [illegible] for planning and the carrying out of the work. This work will very shortly be completed. [illegible] Temporary schools [illegible] wards to [illegible] utility [illegible] have also been designed, and are now nearing completion. The cost will be about £1,450, and will be borne by the War Department. At the end of the war these wards will be taken over by the council on an agreed percentage of the first cost. In addition, a new twenty-two-bed scarlet-fever block, twelve-bed tuberculosis sanatorium and administrative block extension, together with laundry alterations, will shortly be commenced at an estimated cost of £4,000. Numerous plans have been prepared for road widenings, in order [illegible] in case of distress through the war, and these will be put in hand as required. It is also hoped to obtain a grant from the Road Board for [illegible] plant and [illegible] the [illegible] of tar-macadam. The question of the provision of public swimming and slipper baths is to be taken into consideration. Various [illegible] in the [illegible] are to be carried out.

Colne (Mr. T. H. HARTLEY, borough [illegible] and [illegible]). Among the works projected for the year 1915 are the following: [illegible] The [illegible] tration for the purchase of the tramways having been held and the award given, it is proposed to relay several lengths of track. Town Planning.—A [illegible] Board [illegible] to be [illegible] regard to the area for which the corporation are seeking permission to prepare a scheme. All the preliminary formalities have been observed. The area in the present scheme is about 800 acres. Main Sewers and Sewage Disposal Works.—Further extensions to the bacteria beds are proposed in the way of providing some percolating filters to cope with the increased flow of sewage owing to growth of population, and further extensions to sewers are also in hand. Private Street Works.—This work is to be continued out of a loan of £21,000 already sanctioned. Water-carriage Scheme.—Works of this kind are also to be continued out of the loan sanctioned by the Local Government Board of £4,470. Recreation Grounds and Parks.—A scheme has been prepared, at an estimated cost of £5,680, for the laying out and equipping of the Judge Fields Recreation Ground, and a scheme for a public park is also in hand. These and other works are proposed in order to find work for operatives who are thrown out of employment in consequence of the war. Tar-spraying and Tar-grouting.—This work will also be continued during the year on several [illegible] of roads [illegible] constructed.



Colwyn Bay (Mr. WILLIAM JONES, ASSOC.M.INST.C.E., surveyor and water engineer to the urban district council).—Most of the works enumerated to be carried out during 1914 are still in hand and nearing completion, and have been a great boon in reducing unemployment throughout the district. During the current year the following works are expected to be further taken in hand, and the council will have to require the sanction of the Local Government Board for the loans: New electricity generating station (£28,200), refuse destructor (£7,000), new service and balancing reservoir to contain 11,000,000 gallons, extension of cemetery, and the sewering of the western portion of the district (£11,090). The council have also decided to resurface with tar-macadam practically the whole of the main roads in the district, the work being carried out in conjunction with the widening of the Abergele road, and the extension of the tramway track to Old Colwyn, the estimated cost of the work being £2,500. Another very important requirement of the district which will undoubtedly be taken into

consideration shortly by the council is the providing of a public abattoir. The council are in negotiation with landowners abutting on Llanrwst-road for the land necessary to widen the same, and it is expected that this work will be satisfactorily completed in due course at an estimated cost of £1,500. The continued progress and development of the district will necessitate during the year the making up by the council of several streets under the Private Street Works Act, 1892, the extension of many of the public sewers, and the laying of several new water mains.

Congleton (Mr. J. H. WALLERS, borough surveyor).—The works projected are various private street works and road widenings on some of the main roads. Main roads and other roads are to be sprayed with Tarco. The council have instructed the borough surveyor to proceed with the plans for the erection of an elementary school to accommodate about 350 mixed scholars. During 1914 several lengths of water mains were scraped. This work has been so successful that the council have given instructions for further lengths to be cleaned. Alterations to the sewage outfall works are in hand, including the construction of larger humus tanks, sludge lagoons, and sludge pumps driven by Crossley gas engines.

Conway (Mr. F. A. DELAMOTTE, ASSOC.M.INST.C.E., borough engineer and surveyor).—The erection by the contractors of the hut encampment for the two "Pals" Battalions of the Lancashire Fusiliers will be completed at an early date. The council and Board of Agriculture and Fisheries will bring to a conclusion the work of constructing their mussel purification tanks, which will form an interesting study, this being the pioneer establishment in Great Britain of a purification scheme for polluted mussels. The following are among other schemes before the town council: The construction of forty-eight cottages for the working class; two public cemeteries; making up of private streets; reclamation of waste land; construction of sea walls; a scheme for planning out part of the Morfa estate; and several other lesser schemes.

Coventry (Mr. J. E. SWINDLEHURST, M.INST.C.E., city engineer and surveyor).—Many works of an important character are contemplated in Coventry for the year 1915. These comprise the reconstruction of the drainage to a residential district known as Stoke Park, service reservoir, Coundon; laying out of Gosford Green as park and recreation ground, including bandstand; new street across Gosford Green; public conveniences, both above and under ground; extensions to swimming baths; several schemes of workmen's dwellings, some of which are in hand; new pavilion, Spencer Park Recreation Ground; while it is probable that the contract for a public abattoir will be let. In addition to the foregoing, it is anticipated that the water purification plant, Whitley, which is now in hand, will be completed, as will also the following schemes: Sewerage, Holbrooks-lane and Lythalls-lane; new depot for highways department, Leicester-street; numerous street improvements; and bacteria beds at the sewage farm, Baginton. The question of paving the back passages at the rear of houses, annexation, a municipal lodging-house, and town planning, are all matters which have received attention, or will receive attention in 1915.

Croydon (Mr. GEORGE F. CARTER, M.INST.C.E., borough engineer, surveyor and water engineer).—A covered service reservoir to hold 10,000,000 gallons is now under construction by administration. A new well is being sunk at the Waddon works, and a tender for the pumping plant has been accepted. Cast-iron mains, from 15 in. to 27 in. diameter, are being laid by direct labour. New sewage works are being constructed at the South Norwood farm. Tanks are completed and the sprinkler-beds well in hand. The council passed a scheme of extension of the borough hospital to cost £51,000, and the plans and estimates are about to be forwarded to the board. Two underground lavatories will be constructed.

Croydon (Mr. [illegible] J.P., F.S.I., sanitary surveyor, M. Rem. C.E., surveyor to the rural district council).—This important rural district will come to an end as a rural district on March 31, 1915, and will be divided into three large urban districts under an Order made by the Surrey County Council. (1) Mitcham Urban District, consisting of the parish of Mitcham, having a population of 30,000, and an assessable value of £134,000. (2) Beddington and Wallington Urban District, consisting of the northern portion of the parish of Beddington and the hamlet of Wallington, having a population of 14,000, and an assessable value of £120,000; (3) Purley and Coulsdon Urban District, consisting of the parishes of Coulsdon and Sanderstead, the southern portion of the parish of Beddington, and the south-eastern portion of the parish of Woodmansterne, having a population of 23,000, and an assessable value of £205,000. The parish of Addington will be attached to the Godstone Rural District, and the remaining portion of the parish of Woodmansterne to the Epsom Rural District. Among the works projected for the year 1915 are: In Mitcham, the widening and resurfacing of Streatham-lane and the reconstruction of the sewage disposal works; in Beddington and Wallington, the completion of the widening of Woodcote-road; and in Purley and Coulsdon, the completion of the widening of Smithambottom-lane, the construction of a new surface-water outfall sewer, and the resurfacing of the Brighton and Godstone roads. Various private street works will be carried out in all the districts, and the usual quantity of tar-spraying will also be done.

Cumberland (Mr. WILLIAM FINCH, county surveyor and bridge-master).—During the year several extensive improvement works will be in progress on the county main roads and bridges, in addition to the resurfacing and repair work. Many sections of county main roads will be surfaced with tarred granite macadam, and the surface treatment with tar on water-bound granite roads continued on a more extensive scale this year. Further progress will be made with the scheme of resurfacing those county main roads which have hitherto been surfaced with inferior local stone with first-class material. The estimated total cost of the surface improvement works for the year is approximately £30,000. Many applications have also been received from urban authorities within the county for grants towards the extra cost of surface improvement works on the county main roads within their area, and for other road improvements. It is anticipated that the new ferro-concrete bridge at Metal Bridge, on the Glasgow main road, costing over £17,000, and which is now under construction, will be completed towards the end of the year, and also the new 80-ft. span stone bridge in the Alston district, costing £3,500. An extensive road improvement will be carried out at Rowrah, at an estimated cost of £7,000, involving the erection of a new bridge over the London and North-Western Railway. The widening of the district road from Keswick through Borrowdale to Seatoller is being carried out by the county council, at an estimated cost of £7,500, which road will become a county main road upon completion. Several other smaller main road improvements will also be carried out during the year [illegible]

Darwen (Mr. R. W. SMITH-SAVILLE, ASSOC.M.INST.C.E., A.M.I.E.E., borough engineer, surveyor, water and tramways engineer).—The general trade in Darwen, in all its branches, except the iron-smelting works, has been very depressed since the commencement of the war, and in the weaving industry there has been a certain amount of distress. In depressing circumstances such as these it will be seen that it is not advisable to enter upon many new [illegible] especially as the cost

[illegible] completed important [illegible] work [illegible] at a cost of £12,000. On account of losses on the building trade the Health Committee have decided to proceed with the [illegible] at a cost of £6,500 [illegible] The works of [illegible] extension and improvement [illegible] a total expenditure of [illegible] Water Engineer [illegible] [illegible] [illegible]

certain roadways will be put in hand, for which a Road Board grant has been obtained. The latter questions of sewage disposal and additions to water supply have again engaged the attention of the council, and reports on both subjects have been received from a consultant. The erection of a front wall and railing to replace a temporary structure at new cemetery and the erection of a caretaker's lodge are projected. The smaller works include a small fire brigade station, installing additional tar-macadam plant, additions to street and park planting, alteration to exits of the town hall concert hall, reclamation of waste lands, and erection of further sanitary conveniences.

Durham (Mr. John T. Pegge, ex-president Inst.Mun.E., A.S.I., city engineer).—Retrenchment and great care have to be exercised during this year. In view of the probability of distress, a scheme is sanctioned by the county council to spend some £20,000 on a new road to open up the Elvet end of the city, towards Shincliffe, on the Stockton and Hartlepool road. The county council is also going to improve considerably the Crossgate "Peth" for motor vehicular traffic. The city council find it necessary to strengthen the foundations of considerable lengths of roads to carry the motor-bus traffic. An improvement on the Great North road is contemplated by setting back the wall of Wharton Park, and building a shelter for motor-'bus passengers, and a public convenience. A further portion of the river bed—about 1½ acres—is to be enclosed by means of a ferro-concrete wall, and improvements to the town hall and corporation properties are necessary.

Ealing (Mr. W. R. Hicks, Assoc.M.Inst.C.E., borough engineer and surveyor).—The following is a list of the works contemplated during the year: New school for 1,250 children at South Ealing; laying of about 1½ miles of 24-in. surface-water culvert; extension of destructors; erection of additional workmen's dwellings (twenty); erection of [illegible] widening of Hangar-lane; various public improvements, and the laying of some 2 miles of carriageway with tarred slag; the usual private street works; [illegible] of central depot.

Eastbourne (Mr. A. Ernest Prescott, borough engineer and surveyor and surveyor to education authority).—The carrying out of important and extensive works during the present year depends largely on how soon the present hostilities are brought to a close. The largest scheme at present in contemplation is the construction of a coastal road between Eastbourne and Bexhill, detailed plans of which have been nearly completed. If satisfactory arrangements can be made with the interested landowners, and substantial assistance can be obtained from the Road Board, who already look favourably on the proposal, this scheme will soon become an accomplished fact. The estimated cost is £100,000. Additional tennis courts are being laid out at the east end of the town. The surface-water drainage scheme will also be completed during the present year, and plans for a large open-air sea-water bath will also be prepared. Apart from these special works, the ordinary routine work will follow its usual course, and special attention will be given during the summer months to the construction of dustless roads and re-surfacing.

East Grinstead (Mr. W. E. Woollam, M.I.M.&C.E., M.R.S.I., engineer and surveyor to the urban district council).—The works proposed comprise making up [illegible] several private streets, road widenings, laying out new cemetery, [illegible] which is nearing completion.

East Preston (Mr. Chas. W. Leney, M.I.M. and C.E., inspector, highway surveyor and building surveyor to the rural district council).—During the early part of the new year it is proposed that £1,000 shall be spent on sea defence works in the parish of Rustington, if the approval of the Local Government Board and the Board of Trade can be obtained for the scheme, which includes four timber groynes and a short length of concrete retaining wall. An application has also been made to the Local Government Board for powers to borrow £800 for the erection of four workmen's cottages in the parish of Angmering, by way of an experiment, as it is intended that they shall be self-supporting financially. If the scheme is successful, it is anticipated that more houses will be built. The loan will not include the cost of the ½ acre of land which, in this case, has been presented to the council free of all charges by the Duke of Norfolk. The work of widening and strengthening the roads will be continued, and the use of granite and tar-spraying will be extended in place of flints, which is the local material.

Eccles, Lancashire (Mr. Thomas S. Picton, M.I.M. and C.E., borough engineer and surveyor).—The main drainage scheme, estimated to cost £60,984, was commenced last summer, and good progress has been made with Contract No. 1 for the construction of about 1,127 lin. yds. of 7-ft. 6-in. circular storm overflow sewer, and Contract No. 2 for the 6-ft. by 5-ft. outfall sewer, catchpit, and machinery. These two contracts will be completed early in the year, when contracts 3 and 4, for the construction of about 506 yds. of 7-ft. 6-in. by 5-ft. and 444 yds. of 4-ft. by 2-ft. 8-in. egg-shaped sewer will be commenced. The making up of private streets will be continued as in the past, and ten front streets and seventy-three passages will be completed during the year. Application will be made to the Local Government Board for sanction to borrow the sum of £85,686 for the south-east Eccles area scheme. This comprises the purchase and demolition of about 7 acres of insanitary property, and the erection of workmen's dwellings on the site, the widening of [illegible] road and construction of new roads. The corporation are also contemplating erecting twenty-four houses on vacant land behind the Carnegie Library. Sanction has been obtained for the borrowing of £813 for replacing grit setts in Cromwell-road, opposite the hospital, with granited-rock asphalt. The revision of the 1/500 ordnance survey of the borough will probably be undertaken during the year.

Erith (Mr. Harold Hind, surveyor to the urban district council).—The [illegible] works as preceding, and it is hoped to [illegible] Dumont. It is proposed to erect an additional ward, and extend the [illegible] of the isolation hospital. Sewers [illegible] be made up under the Private Street Works Act, 1892, also certain road improvements are to be carried out. A tar-macadam mixer is being purchased, and a number of water-bound macadam roads are being resurfaced with tar-macadam. A new filter-bed is being erected at the sewage disposal works. Extensions to sewers are also contemplated.

Evesham (Mr. Henry S. Harvey, borough surveyor).—A scheme has been prepared for the erection of fifty workmen's dwellings, but it has not yet been definitely arranged to commence the work. Extensions [illegible] isolation hospital.

Exeter (Mr. Thos. Moulding, [illegible] engineer and surveyor). There [illegible] proposal before the council [illegible] constructing and improving the sewage disposal works of the city, which must be [illegible] during the year. The [illegible] the water. The [illegible] during the next twelve [illegible]

tramway line, and the question of the provision of sheds, &c., has to be considered. The question of the refuse destructor is again coming up, and it is expected that the work will be commenced during the coming year. Sewage street improvements and widening which are in hand will be completed. Several blocks of artisans' dwelling will be commenced during the year. These dwellings would probably have been completed had it not been for the war. The above, taken together with the usual routine work of the department, will keep the city engineer's department pretty busy during the year.

Farsley (Mr. HAROLD H. NORTH, M.I.MUN.E., engineer and surveyor).—The year 1915 promises to be a busy one so far as municipal works are concerned. The following is a list of work that will be carried out during the year, and estimates prepared by the surveyor:—Extending at the sewage disposal works the wall (now in progress), coke breeze roughing filters, filtration beds and sprinklers, humus tanks and sludge filters. Alterations will be effected at the present screening chamber. It is also proposed to lay out the gardens in front of the council offices, and to carry out various private street works and road widenings, and other improvements. Resinite and Glutrin have been used on tarred roads with good results on very heavily trafficked roads and roads with steep gradients. A small length of road is now being laid with Vianex as a binder.

Foleshill (Mr. A. E. NEWEY, M.S.E., engineer and surveyor to the rural district council).—Plans have been prepared for thirty workmen's dwellings in Bedworth and thirty in Foleshill, and a local Government Board inquiry has been held. These houses will be commenced early in the year, tenders having been accepted for the work, amounting to £14,250. At Bedworth sewage works the council have in course of construction and nearing completion detritus tanks, and sludge lagoons. The filter-beds will be reconstructed afterwards. At the waterworks a new borehole has been sunk, and it will be necessary to put down a water softening plant and storage reservoir. Four streets have been made good under the Private Street Works Act, 1892, and it is intended to proceed with the same. The widening and strengthening of the roadways is constantly being carried on owing to the increasing heavy motor traffic to collieries and brickworks.

Frimley (Mr. T. CLEMENT JONES, engineer and surveyor to the urban district council).—No new works will be carried out during the ensuing year owing to the railway company being unable to deliver material, and to the total lack of labour and haulage, nearly all at present employed by War Department contracts.

Frome (Mr. F. W. JONES, ASSOC.M.INST.C.E., surveyor and water engineer to the urban district council).—The chief works projected for 1915 are the installation of a suction-gas driven pumping plant at the present pumping station, the extension of the sewerage system at Marston-road, and a street improvement scheme at Broadway. Further trials will be made with granite and Trinidad asphalt in recoating highways.

Gillingham, Kent (Mr. J. L. REDFERN, A.R.I.B.A., borough surveyor).—In the coming year it is proposed to widen Watling-street to a minimum width of 40 ft. for a distance of a little over a mile. Widenings will also take place in Woodlands-lane, Heathfield, Hempstead road and Bridge road. The usual amount of tarring and surfacing will be done. Fifteen workmen's cottages will be erected in Toronto road, and six in Middle-street. A new mortuary, a public convenience above ground, and a covered swimming bath, 100 ft. by 40 ft., with a few slipper baths attached, are to be erected. A considerable amount of sewering, both foul and surface, will be carried out, and a 36-in. intercepting sewer for storm water will be constructed to relieve the district near the Gillingham Gate of the Dockyard.

Glemsford (Mr. H. L. TAYLOR, surveyor to the urban district council).—The only new work in contemplation at present is the filtration of the water supply. There is a large amount of iron in the water, which offends the nose, eye and taste of the consumers. Other work will consist of the gradual improvement of the roads and footways as occasion offers.

Gloucester (Mr. RICHARD READ, ASSOC.M.INST.C.E., city surveyor).—It is proposed to construct two new roads and widen and improve four others. The contract has just been let for a tuberculosis hospital, and the council are completing the new sewer outfall with tunnel and syphon under the river Severn. The second borehole, 18 in. diameter, in the new red sandstone at Ketford, about 16 miles west of Gloucester, is also being proceeded with, in order to obtain an additional supply of water which will be pumped into the existing reservoir at Haresfield, 9 miles from Gloucester. The council are considering a scheme for building [illegible] the working classes.

Glyncorrwg (Mr. W. P. JONES, engineer and surveyor to the urban district council).—The Afan Valley extension is now proceeding, and is estimated to cost £10,000 in connection with which a contract has been let to Messrs. [illegible] The contract includes a well, 40 ft. deep, and 10 ft. diameter. The sewer also completed will form a connection through the Afan Valley Main Sewer. The Afan Valley main trunk sewer having been completed, application will be made to the Local Government Board for a loan towards the subsidiary sewers. The council have under consideration a scheme for providing a small-pox hospital, and a scheme to [illegible] supply of the Glyncorrwg Colliery Co. [illegible] supply.

Godmanchester (Mr. C. F. MAYFIELD, surveyor and inspector to the urban district council).—The council have the estimates prepared in March. It is likely that portions of the main roads will be reconstructed with a bituminous binder on the grouting system. A proposal for filling the existing sewer-flushing tanks by means of a windmill will be considered. The works in hand this year include the resurfacing of the main street with 2½-in. granite, and grouted with Clare's Bi-Tarco for a binder; also a new river wall, built in blue Staffs bricks and cement, with concrete posts and iron tubing as a protective fence on the top. The wall acts as a retaining wall for the road, and is built high enough to prevent the flooding of the town.

Cosport and Alverstoke (Mr. HERBERT FROST, engineer and surveyor to the urban district council).—The special works so far projected for the forthcoming year are: The making up of several private streets; construction of a new [illegible] small-pox hospital; reconstruction of the ferry landing, Portsmouth Harbour, for which a new scheme is to be called for; extension of Tarmac surfaced and tar treated roads; extension of elementary school buildings; rebuilding of sea wall; and some probable laying out and improvements of recreation grounds; the completion of sewage sea-outfall; completion of scheme for the drainage of old properties [illegible] connected up with the main sewerage system, and the purchase of a motor fire engine, and probably motor lorries for haulage and other works.

Crimsby (Mr. H. GILBERT WHYATT, M.INST.C.E., borough engineer and surveyor). During the past twelve months the construction of public [illegible] has been carried out in the [illegible] to the value of £3,000, exclusive of the Welholme-road level crossing, which has been completed, at a cost of about £1,100. The construction of new streets on the Freemen's estate has also been carried out at a cost of about £3,200, the estimate being £3,639. The construction of the Weelsby-road and Bargate Boulevard, at a width of 72 ft., has been commenced, and is now in hand, the estimate being £19,000, towards which the Road Board has given a grant of £5,000. The subway under the railway at Weelsby-road (which will necessitate the raising of the lines) is now under negotiation with the railway company, the estimated cost being from £10,000 to £12,000, and, as soon as the details are settled, application will be made to the Local Government Board for their sanction. The Town Planning Committee has decided upon three town planning schemes, and the office staff is being augmented in order to cope with the extra work. Schemes are now being considered

for a tuberculosis dispensary with maternity clinic adjoining, and also for a tuberculosis hospital, and this will be laid before the Local Government Board within the next two months. As regards the tuberculosis sanatorium, negotiations are now proceeding with the three divisions of the county of Lincolnshire for a joint sanatorium, contributed to by the various authorities, and a site has been provisionally agreed upon. Sanction has been received from the Local Government Board for the construction of new sewers and culverts in the Ainslie-street and Wintringham-road district, at an estimated cost of £7,948; tenders were advertised for, but, after being sent in, the contractor to whom the work had been awarded asked for an additional price for his work on account of the war, the result being that the work has been postponed until the conclusion of hostilities. A scheme for the erection of a bridge over the railway in the centre of the town, at a cost of £120,000, in addition to the purchase of land, had received the approval of the town council, and application was to have been made to Parliament during the present Session, but, owing to the war, this has been postponed until next November. The Great Central Railway obtained Parliamentary powers in 1912 for the construction of a large extension to their fish dock at Grimsby, and they obtained tenders for this work in July last. This also has been postponed until the conclusion of the war.

Grimsby (Mr. ALBERT HOBSON, M.I.M. AND CO.E., engineer and surveyor to the rural district council).—Several streets are to be completed, at a cost of £1,850. A loan for £2,212 has been obtained in respect of surface-water sewerage for the parish of Immingham, and it is proposed to commence this work early in the year. A scheme of sewerage for this parish, estimated to cost £18,500, is now before the Local Government Board. Sanction to a loan of £4,990 has been obtained for the widening and improvement of King's-road, including the construction of a new bridge, and it is proposed to commence this work, part departmentally and part by contract, at once. Other projects include a large scheme of town planning, consideration of a housing scheme, granite setts, and tar-spraying of considerable lengths of the highways, and the extension of sewers in various parishes.

Guildford (Mr. E. YOUNG HARRISON, ASSOC.M.INST.C.E., A.M.I.M.E., borough surveyor and water engineer).—The council have already decided to carry out the widening of the London-road, Chertsey-street, and Farnham-road improvement. A 15½-in. borehole has been sunk into the chalk, [illegible] capable of yielding a further supply of [illegible] for the town of 50,000 gallons per hour. A [illegible] pumping plant, delivering 10,000 gallons per hour into the reservoir, and a [illegible] pumping station is to be provided. Further reservoir accommodation, and a proposed [illegible] the whole of the town's water supply, are under consideration. The contract for the erection of twenty houses for the working classes is nearing completion, and it is proposed to provide further accommodation to meet the urgent need for this class of property. Allen House Grounds, and the Foxenden Quarry in the centre of the town, having an area of 10 acres, have been presented to the town for the use of the public as pleasure grounds. A scheme for laying out the site is to be prepared during the year. Alterations and additions to the corporation sewage works are in course of preparation to meet the requirements of the Thames Conservancy. Several private street works are in hand and under contemplation, also the extension of the wood paving in High-street. The council have before them recommendations to provide means for preparing their own tar-macadam, and for reorganising the [illegible] administrative departments.

Halifax (Mr. JAMES LORD, ASSOC.M.INST.C.E., borough engineer and surveyor).—A Bill is being promoted in Parliament for tramway extensions in Brighouse and Rastrick to the Huddersfield boundary, Elland, Ripponden and Stainland, and trackless trolley cars to Siddal and Wainstalls, together with doublings on various parts of the system, at an estimated cost of £164,000. In connection with the sewage disposal works a new sludge main from the humus tanks at Copley to the press works at Salterhebble is about to be laid, and a scheme for storm-water treatment is being considered. Schemes for a refuse destructor and new public abattoirs are under consideration. New cast-iron main outfall sewers in the Hebble and Ovenden brooks are in progress of construction, together with a new main sewer in Keighley-road. The extensive widening of Huddersfield-road, co-extensive with the sewage works, will be completed during the ensuing year.

Harrogate (Mr. C. E. RIVERS, ASSOC. M.INST.C.E., borough engineer and surveyor).—Several schemes which were contemplated last year are standing in abeyance in consequence of the war, and the works for the ensuing year have not yet been decided upon. Private street improvement works will be proceeded with. Twelve streets are now in hand, and plans are being prepared for another ten streets. New surface-water drainage schemes are in progress in several districts in the borough, and will be completed in the spring. The erection of a new elementary school for 450 children is in hand, and will be completed in the early summer.

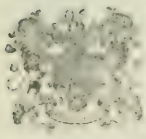
Hartlepool (Mr. A. P. HORSLEY, borough engineer and surveyor).—Under the Housing of the Working Classes Act the council have approved of a scheme for clearing an insanitary area, comprising 111 properties, laying out new streets, and the erection of thirty-four workmen's dwellings, at an estimated cost of £15,000. The scheme is now before the Local Government Board. As an improvement scheme, the council have with funds at their disposal acquired four blocks of insanitary property adjoining this area, and intend to demolish the same and erect on the site sixteen better-class houses, involving an expenditure of £8,500. The work to be put in hand at once. Plans for a new elementary school for 864 scholars are now before the Board of Education, and the other prospective works include a shelter on the cliffs, re-formation and sewering of Central-road, private street improvement work, and [illegible] on the Town Moor.

Harwich (Mr. F. HAROLD FRENCH, borough surveyor).—The works projected for 1915 include the reconstruction of low-level sewers, estimated cost, £5,000; construction of new road for military authority, and repairs to existing tracks, estimated cost £700; widening of dangerous corners in several parts of borough; the building of ten workmen's dwellings, approved by Local Government Board; construction of new public convenience; and the making up of several private streets under the Private Street Works Act.

Herefordshire (Mr. G. H. JACK, F.G.S., M.S.A., county surveyor).—The principal works to be undertaken during 1915 are as follows: Main Roads and Bridge Department—5 miles of new road foundations and drainage, 9 miles of new bituminous surfaces, 10 miles of tar-painting on reconstructed roads, and repairs to many ancient bridges; Architectural Department—two new elementary schools, one new police court, additions to county college, and extensive repairs to many council schools and police stations. There are in Herefordshire 502 miles of main roads, 400 bridges and culverts, 178 schools, council and voluntary, and 10 police stations and court-houses.

Haslingden (Mr. J. SINGLETON GREEN, borough engineer and surveyor).—Among the works to be carried out this year will be the completion of the new central council schools to accommodate 1,200 scholars. Important road widening schemes at Helmshore and Rising Bridge will be commenced, at an estimated cost of £2,000. Towards these grants have been promised by the Road Board and county council.

ground. The borough surveyor has prepared a



Hereford (Mr. [illegible]) estimated at £8,000. Sixty-two cottages are in hand, and will be completed during the existing financial year, at an estimated cost of £11,800. An extension of the sewage [illegible] at an estimated cost of £950 has been sanctioned, and will be commenced in March next. The [illegible] will be completed during the summer. Assistants and forty-seven men from the surveyor's department having joined Kitchener's Army or the Territorials, renders postponement necessary of the following: Alterations to [illegible] the conclusion of the war.

Hertfordshire (Mr. J. S. Killick, Assoc.M.Inst.C.E., county surveyor).—The principal works in hand or contemplated during 1915 are: Reconstruction of High Bridge, Radlett, £500; [illegible] Bridge, £700; London-road, Bushey, between the Middlesex County Council and Watford Urban District, £20,575; new petty sessions court, Barnet, £4,799; ditto, Stevenage, £6,138; police station, Letchworth, £3,669; education offices, Hertford, £3,804; resurfacing various trunk roads, some with asphalt and others with tar-macadam, £140,419; depot at Hatfield [illegible] Letchworth, £1,100; new sanatorium at Willian, near Letchworth, £27,662; Barnet, Byng-road mixed and [illegible] £3,260; Hoddesdon [illegible] Park mixed school, £1,390; Bishop's Stortford Northgate school, £3,611; and Elstree, Berkhamsted school enlargement, £2,600. The figures given are the estimated cost in each instance.

Heywood (Mr. James B. Nuttall, borough surveyor).—The work intended to be carried out during the coming year will be as follows: Private street works; granite paving main roads; intercepting sewers; laying out of Heywood recreation ground, and provision of bowling green, proposed extensions of Queen's Park and new boating lake; extensions of electricity works; new electricity sub-station, Heap Bridge; and alterations and extensions of the sewage works.

Heston and Isleworth (Mr. J. G. Carey, Assoc.M.Inst.C.E., surveyor to the urban district council).—The programme of works proposed to be undertaken during 1915 is an extensive one. Included among them are the resurfacing of Bath and Staines roads with asphalt-macadam, and other contingent works, at an estimated cost of £40,326, and the resurfacing of Heston-road with bituminous-grouted macadam, and the construction of an 18-in. surface-water sewer and other contingent works, at an estimated cost of £8,879. The reconstruction of the tram track and paving of the margins of the carriageway with wood, and granite sett and Lithofalt paving in High-street and London-road, for a distance of 2½ miles, will be completed in the spring. The new Alexandra schools for the accommodation of 840 children are at present in hand, and will also be completed in the spring, at a cost of £13,000. The new Great West Road, which for the greater part of its length runs through the heart of this district, will probably be under construction by the Middlesex County Council. In addition to the above, the work involved with the extensive town [illegible] additions to the surface-water sewerage system are

Highworth [illegible] to the rural district council).—The projected works include the reconstruction of about 1¼ miles of dis[illegible] metalled road. The roadway is to be made up 20 ft. wide, with 12-in. foundation, and the surface finished with Mendip limestone. The estimated cost is £2,500. Wroughton: Extension of water supply; 250,000-gallon reservoir, with pumping plant, estimated to cost £1,336.

High Wycombe (Mr. F. J. Rushbrooke, M.I.M. and Co.E., borough [illegible] It is understood that the reconstruction and extension of the sewage outfall works, and sewering of W[illegible] Marsh (£8,400), a road extension, and ferro-concrete bridge, extension of surface-water drainage, and the conversion of a further length of water-bound to tar-macadam road, will be the chief special works put in hand during the coming year. The new grammar school and an elementary school will be completed.

Hinckley (Mr. F. H. Clemi, Assoc.M.Inst.C.E., surveyor and waterworks engineer to the urban district council).—It is proposed to lay down a new pumping main at the sewage outfall works, and to proceed further with the experimental filter-beds. The water scheme for the parish of Burbage will be in course of construction, and the council intend to reconsider the question of a refuse destructor, and the erection [illegible] dwellings.

Holland, Lincs, South Division (Mr. A. W. Lloyd, M.I.M. and Co.E., county surveyor).—It is not proposed to undertake any works of magnitude during the year. In addition to ordinary routine work, the lengths of roads to be tar-sprayed are to be increased from 18 miles to 28 miles. The council have had a scheme for the remetalling and steam rolling of a considerable length of main roads under their consideration, but this has been postponed for the present.

Honiton (Mr. A. Tillotson, M.I.Mun.E., C.R.San.I., borough surveyor, sanitary inspector and waterworks manager).—The works contemplated for 1915 include the construction of new sewage disposal works and sewerage alterations, for which the Local Government Board [illegible] sanctioned a loan for £4,700. The whole of the granite-surfaced roads will be tar-painted by direct labour.

Horsham (Mr. R. Renwick, surveyor and water engineer to the urban district council).—No new works of any importance are in contemplation for the coming year in connection with the surveyor's department.

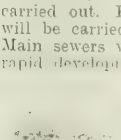
Hove (Mr. H. H. Scott, Assoc.M.Inst.C.E., borough surveyor).—The town council have decided to erect machinery to crush the whole of the house refuse from the borough, at a cost of £5,000.

Hucknall Torkard (Mr. W. Swann, surveyor and waterworks engineer to the urban district council).—Among the works projected by the council for the year are the erection of a fire brigade station, stables and cart-sheds. The laying out of 11 acres of land for a public park, making provision for bowling greens, cricket pitches, together with bandstands and other buildings, are also contemplated.

Huddersfield (Mr. K. F. CAMPBELL, M.INST.C.E., borough engineer and surveyor).—Good progress is being made with the housing scheme authorised by the town council, for which the Local Government Board have sanctioned a loan of £103,555. This provides for the erection of 500 working-class dwellings, referred to in last year's list of projected works. Contracts have already been let for 133 houses, which are now in course of erection. The cost per house of five rooms is, approximately, £200 inclusive. The corporation have obtained the approval of the Local Government Board for a town planning scheme applicable to three special areas within the borough, and are engaged upon the preparation of a scheme to deal with the remainder. In addition to the usual work connected with the maintenance of highways and sewerage systems, a continuation will be made with the paving in granite and wood of certain sections of main roads, which work forms part of a scheme for street widenings, involving a total expenditure of £72,000, towards which a grant is being made by the Road Board. A commencement will be made with the construction of important relief sewers in certain districts that have rapidly developed in recent years. A scheme for the disposal of sludge is being installed under special conditions, and the work will be in operation on an early date. Plans have been approved by the council for the erection of new swimming baths at the junction of Cambridge-road with Claremont-street, and tenders will shortly be invited. It is also proposed to extend the existing baths. The Education Committee propose to erect an open-air school for defective children, and to extend the present buildings of the municipal high school for girls. An important scheme for the extension of the municipal college is being considered, and, it is expected, will be approved on an early date. Extensions of the tramway system in various ex-municipal districts, for which Parliamentary powers have been obtained, have been completed. The doubling of the main lines within the borough is in course of construction. It is intended to apply to Parliament next Session for additional powers to extend the tramway to other districts contiguous with the county borough. An important scheme for the erection of a tuberculosis hospital has been approved by the Local Government Board, and it is intended to invite tenders on an early date.

Hull (Mr. F. W. BRICKNELL, ASSOC.M.INST.C.E., acting city engineer).—No street works or street widenings are likely to be carried out. Certain very important works have been under the consideration of various committees, but it is not intended to press them forward during the war. The tramway extension on Cottingham-road is nearly completed, and will probably be opened early in the New Year. Further extensions have had to be deferred in consequence of the shortage of wood paving blocks. Powers are being sought for a loop through Chariot-street and Waterworks-street, and extensive repair shops are in construction at the Liverpool-street depot. A tuberculosis hospital is under construction at Cottingham Castle, and it is contemplated to erect an isolation hospital on adjoining land. The site for a boating lake adjoining Pickering Park has been presented to the town by Mr. Christopher Pickering, and a grant-in-aid has been made by the Local Government Board. It is intended to proceed with the construction of the lake as soon as the exigencies of unemployment demand it. New waterworks are in hand on the Dunswell site. The Education Committee have a higher grade girls' school in hand, and contemplate the erection of an open-air school, in addition to their usual programme of extensions.

Ilford (Mr. H. SHAW, M.INST.C.E., engineer and surveyor to the urban district council).—This council early in the new year will complete the erection of a phthisis pavilion, which has been erected at a cost of over £1,100. Extensions to the administration block at the isolation hospital are proposed, at an estimated cost of about £4,000. The refuse destructor buildings will be erected, and a plant by Heenan & Froude installed, costing about £22,000. Quantities are being prepared for new baths to be erected at an estimated cost of £25,000, and it is anticipated the erection of these buildings will be proceeded with during 1916. Plans are being prepared for the erection of a central library, which work, it is anticipated, will be pushed on with. Application has been made to the Local Government Board, and, subject to their sanction to the loan, a new park, 30 acres in extent, will be laid out at Aldborough Hatch, at an estimated cost of nearly £11,000. The laying out of the extensions to Goodmayes Park will shortly be completed, which will add to the parks area in this district another 30 acres. A contract amounting to about £34,000 will be proceeded with for granite-sett paving two main roads in the district. The usual large amount of private street works will undoubtedly be proceeded with, amounting to about £8,000, and a considerable number of road improvements will also be carried out. Extensions amounting to over £4,000 will be carried out at the sewage disposal works. Main sewers will be constructed, as the continued rapid development of the district requires.



Ilkeston (Mr. HENRY J. KILFORD, borough surveyor). Sewerage: The completion of the (£30,000) sewerage scheme, and four small electric pumping stations. Public Street Improvements: High-street widening, including the demolition of a lot of old property, and continuation of a new road from High-street to Cantelupe-road, about 300 yds.; new bridge over the Nutbrook Canal, on the main road to Derby; private improvement works estimated to cost £2,000. Recreation Grounds: New bowling green, pavilion and bandstand, Victoria Park; enlargement and reconstruction of cricket ground for county matches, new pavilions, and fencing, and entrance gates to the Rutland recreation ground. Water Department: Duplication and laying in of larger mains; erection of a reinforced-concrete water tower. General: New post office by the Government in South-street, adjoining the free library; new fire station; motor fire engine and equipment; public baths; new by-laws.

Inverness (Mr. T. H. SCOTT, ASSOC.M.INST.C.E., burgh engineer and surveyor).—The work contemplated by this department for the ensuing year embraces a new joint infectious diseases hospital and sanatorium to cost about £15,000. Plans, specifications and schedules pertaining to this scheme have been approved by the Local Government Board, and tenders have been received. The hospital is for the joint use of the burgh, and the first and second districts of the county of Inverness. Plans are in course of preparation for public baths, and this scheme will probably materialise during the coming year. Granite-sett paving will be considerably extended within the burgh, and private improvement works will be continued, as a number of streets still require to be formed. A new district sewerage scheme is just about completed, and probably another similar improvement will be carried out in another district of the town. Among the smaller matters which may engage the attention of the department are additions to the public slaughter-house, new workshops for the department, additional public lavatory accommodation, and tarpaving of macadamised roads.

Ipswich (Mr. JOHN R. MEAD, borough engineer and surveyor).—In addition to the work usually carried out by administration and charged to revenue account the following works will be proceeded with: Public Health Offices (£7,300).—This block of buildings provides ample accommodation on the ground floor for the sanitary inspectors, tuberculosis dispensary, including X-ray room, and for the infants' department. On the first floor provision is made for the medical officer and his assistants, private offices, laboratories, and the school clinic, which includes an anæsthetic, operating and recovery room, together with a dental department. Small-pox Hospital (£4,800).—These buildings are in hand, and comprise administrative block, pavilions, laundry and mortuary on a 10-acre site, about 2 miles beyond the borough boundary. Isolation Hospital.—Extensive additions are now being made at this hospital, costing about £9,000, which includes a twenty-four-bed cubicle block, and contracts have recently been let for heating the institution at a cost of £4,200. In addition to the above tenders have also been invited for two

twenty-foot pavements which will cost about £3,700. Contracts for the following will probably be let during the year: A new ferro-concrete bridge over the River Orwell, to replace the existing Stoke Bridge, including kerb, and additions to concrete bridge at Ipswich Docks; and extensions to sewers required by Chemical Works, now being erected, rearranging the existing sewage works.

Itchen (Mr. T. A. Collingwood, engineer and surveyor to the urban district council).—The works which will be carried out during the year consist of street improvement; private street [illegible] the existing sewage and sewage disposal works.

Kendal (Mr. F. W. Oxberry, borough engineer and surveyor).—A [illegible] has been widened at a cost of £3,400, and two or three smaller widenings have been effected. A housing scheme for the erection of twenty-four workmen's dwellings is in hand, contracts having been let and the work commenced. Extensions to the sewage disposal works (£10,000) are also in progress. [illegible] gravel footpaths are being substituted by concrete flags. During the year it is proposed to extend the sewers at a cost of about £1,000, and the conversion of water-bound macadam roads into tar-macadam will be continued. It is proposed to extend the borough boundaries by including a part of Scalt'waiterigg, the memorial and plans relating thereto having been presented to the Local Government Board.

Kent (Mr. H. T. Chapman, county surveyor).—During the year 1915-16 it is probable that the strengthening and carpeting of the most important main roads will be very extensively proceeded with. Prior to the war, Kent obtained a very large quantity of granite from Belgium, and this source of supply will probably be unavailable for some time. War risks, and consequent higher freights, have caused a great increase in the cost of supplies by water, and railway rates cause other important materials to be very costly. The council will therefore be compelled to depend to a greater extent on the local materials, and it is the intention of the county surveyor to utilise these to the utmost. By the use of proper plant (for which purpose the Road Board have granted a loan free of interest), local materials—*e.g.*, flint, shingle, and sand—if properly broken, graded, heated, and mixed with pitch or bitumen, as good, if not better, results can be obtained than with the more costly granites and basalts. It is also proposed to use a larger quantity of Kent rag tarred macadam and slag tarred macadam than in previous years. Considerable damage has been and is being caused to the main roads by heavy military traffic, and the reinstatement of this will entail extensive repairs. Relief labour schemes, estimated to cost over £200,000, have been prepared in case of distress owing to the war. Although these include many more or less desirable improvements, it is to be hoped that circumstances will not arise necessitating their being put in hand for the purpose of providing labour for unemployed. Many other Road Board improvement schemes have been prepared. These include diversions, widening and strengthening of carriageways, improving dangerous turns, surface-water drainage, and the kerbing and forming of footpaths. The council have under consideration the improvement of about 6 miles of the London to Folkestone main road from Hewingreen viâ Frogholt to Cheriton; a new road connecting Dartford and Erith; the continuation of the widening of the Blackfen to Bexley road; and many other extensive schemes; also the rebuilding and widening of Dartford Town Bridge. Practically the whole of 750 miles of rural and urban main roads will, no doubt, as in previous years, be tar-painted. This will require over 1,000,000 gallons of tar.

Kesteven (Mr. W. B. Purser, Assoc.M.Inst.C.E., county surveyor).—Plans are now being prepared for a new school in Starford for 600 scholars, and in Wykeham for 120. Roads are now constructed with improved binders, and some 40 or 50 miles are surface-sprayed every year. Near Grantham several main roads have to be strengthened and receive extra attention owing to the heavy military traffic in this neighbourhood. Extensive schemes have also been prepared for the prevention of floods, but these will only be carried out in case of national distress in order to find work for the unemployed.

Kettering (Mr. Thos. Reader Smith, Assoc.M.Inst.C.E., surveyor to the urban district council).—The public baths, which have been in hand during 1914, are now approaching completion. The open-air bath was sufficiently advanced to be opened last June, and the covered bath, with slipper and vapour baths, is approaching completion. Other work may include some extension of wood block paving in the centre of the town, a scheme for improvement of footways, and [illegible]

Kidderminster (Mr. A. James, borough surveyor).—The projected works for 1915 are sewage disposal works and the drainage of the districts recently added to the borough, together with new engines, rising main and settling and storm water [illegible] of an estimated cost of £31,000. The reconstruction of roads under Road Board grants, and the construction of streets under the Private Street Works Act, 1892, together with the tar-painting of about 12 miles of roads, will also be proceeded with.

Kidderminster (Mr. G. J. Shepherd, surveyor to the rural district council).—Additional to the general routine work in this district, more road widening and improvements will be carried out, and important road diversions are projected. Considerable sections of roads will be tar-sprayed, and materials other than ordinary macadam will be adopted to cope with the increased motor and mechanical traffic. Schemes have been approved by the Local Government Board for supplying the parishes of Wribbenhall and Churchill with a water supply, and these will be carried out forthwith.

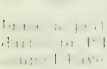
King's Lynn (Mr. Alfred J. Smith, borough surveyor and water engineer).—The works for the ensuing year have not at present been definitely settled, but it is probable that they will include additional lengths of roads within the borough, to be reconstructed upon the same principle as adopted last year—viz., by laying a solid foundation of slag, and facing up with 3 in. of granite, grouted in with Tarvia. Several private streets will be made up, and an additional stand-by pumping plant erected at the waterworks.

Kingston-upon-Thames (Mr. R. Hampton Clucas, borough surveyor).—The council's works for the ensuing year will include a new secondary school to be erected on land next to Denmark-road. The main Hoggs Mill River passes through the site, and before the ground can be used for school building purposes it will be necessary to divert the course of the river by constructing retaining walls and forming a new river basin 20 ft. wide for a distance of about 380 lin. yds. This work will be executed at an early date. New wood-paving works and important street improvements are also contemplated, and several streets will be commenced under the Private Street Works Act. The work of converting the roads from ordinary water-bound macadam to tar-macadam, Plascom grouted or carpeting, will be continued. Plans have been prepared for an additional swimming bath.

Kirkcaldy (Mr. J. L. Lumsden, burgh surveyor).—The principal work next year will be the erection of an additional sanatorium for twenty-four beds and additions to administrative block and a dispensary. All these new buildings are close to the fever hospital in Dunnikier-road. The total estimated cost of the buildings is £5,050. The proposed esplanade is again being revived, but it is

difficult to say whether the proposals will mature. The cost is estimated at about £22,000. A fair amount of tar-spraying is intended to be done. The work in connection with the new outfall sewer at Charlotte-street, and the built sewer along Sands-road, is making good progress, and it will probably be completed by March. The contract for this work is £5,258.

Kiveton Park (Mr. Frank Hewitt, F.S.I., engineer and surveyor to the rural district council).—Highways: The widening of Outgang-lane, Starchhouses-road and Laughton-road being nearly completed, the improvement of a large number of other roads will be dealt with. Surveys and drawings are in hand, with the object of a loan being raised for the first twelve of these. Experimental lengths of Roncace and Vianex roads are being tried. During the summer further roads will be metalled with tar-macadam, and a large amount of tar-spraying will be carried out by contract and direct labour. Additional tar boilers and spraying machines have been purchased for the work. Private Streets: Plans for three streets are at present in the hands of the Local Government Board. Surveys and drawings are in preparation for four more, and these will be followed by a large number of others. Bridges: Drawings are in hand for the reconstruction of Hard-lane Bridge. Two new road bridges are proposed by the promoters of the new Worksop and Bawtry railway scheme. Sewerage and Sewage Disposal: The Local Government Board's sanction is awaited to the surveyor's scheme for enlarging Dinnington outfall works (£5,000). The plans for extending the disposal works at Kiveton Park are being amended in accordance with the Local Government Board's suggestions. The estimated cost is £3,000. Surveys are proceeding with a view to dealing with the Anston outfall, and the re-sewerage of South Anston will shortly engage the attention of the council. Levels are being taken for a sewerage and sewage disposal scheme for the village of Waleswood, and other purification works are also in contemplation. Drawings are in hand for a number of surface-water sewers, and extensions to existing sewers. Water Supply: Additional mains and other works will probably be carried out during the year. Scavenging and Refuse Disposal: The question of inaugurating a system of scavenging Dinnington by direct labour to supersede the present contract system is now being considered. It involves the purchase of horses and carts and the erection of stables and cart sheds. The wholesale conversion by the council of the privies into water-closets will also be considered. Improvements and renewals at the refuse destructor will be carried out during the year, and probably extensive alterations to the sewage pumping station and plant. Public Buildings: The new conveniences at Dinnington are nearing completion, and the surveyor's plans for a public mortuary in the same parish are under consideration. The question of the purchase of an additional steam roller and the erection of roller-house, cart shed and other depot buildings will be dealt with during 1915. Artisans' Dwellings: A couple of housing schemes are at present occupying the attention of the council.



Leeds (Mr. W. T. Lancashire, M.Inst.C.E., city engineer).—The present proposal for extending the sewering of the city, including the provision of a pumping station at Shadwell, to enable a portion of the extension of the city boundaries to be [illegible] completed. The city council have now authorised the preparation of town planning schemes for dealing with an area of about 4,025 acres. A new street, 60 ft. wide, adjacent to the proposed extension of the Leeds General Infirmary, in commemoration of the reign of King Edward VII., has been completed. The reconstruction of an area of about 60 acres in the centre of the city, acquired under the Housing of the Working Classes Act, 1890, is still proceeding. The city council have authorised an application to be made for the borrowing of money under the Housing (No. 2) Act, 1914, for the erection of forty-eight cottages. The city council, in conjunction with the trustees of Wade's Charity, are providing for a new open space of some 2½ acres near the centre of the city. The erection of a municipal hospital and administration block on the Killingbeck estate will be completed early in the year, also the erection of a tuberculosis pavilion and other additions to the Tuberculosis Hospital. Several street improvement works, Parliamentary and others, are being carried out. Under Mr. G. A. Hart, M.Inst.C.E., further progress has been made with the disposal works, and the work for constructing the high-level intercepting sewer is in hand. Under different departments an extension of the dead-meat market is being proceeded with, and new tramway offices are being erected.

Leek (Mr. W. E. Beacham, surveyor and waterworks engineer to the urban district council).—Several important works will be put in hand during the current year. During the past year the main roads leading to Ashbourne and Buxton have been improved by widening, and this year footpaths are to be put down over the land so added. The construction of several new streets near the station is contemplated, which will open up the west end of the town, and provide better means of communication. The Local Government Board inquiry has been held, and sanction to borrow the sum of £3,000 is expected. The laying out of the Brough Park (11 acres in extent) is contemplated, at a cost of £3,660. Extensions to the sewage disposal works in the south district are to be proceeded with, including settling tanks and additional artificial filters. Works of improvement in connection with the sewage disposal of the north district are also to be carried out, and with the ordinary work of street widenings and private street improvements, the year promises to be up to the average in municipal progress.

Leicester (Mr. E. George Mawbey, M.Inst.C.E., borough engineer and surveyor).—An extensive scheme for additional works in connection with town water-sewage disposal is now under consideration. New foul-water sewers will be laid in Evington-road, Leadenhall-street, and Spittlehouse-street, and another section of tributary sewers constructed. Clean trade-water and storm-water sewers in Asylum-street and Deacon-street will be completed, and a defective storm-water culvert in Woodgate will be replaced by one of more modern type. Extensions to the tramway system will be carried out. Work is at the present time in progress on two routes, which will be completed during the present year, and it is expected that a start will be made on one or two more routes. Large car-repairing shops and the extensive additions to the Lero generating station will be completed. A new house for the superintendent of the tramways main car depot will be erected. Extensive and numerous road improvements will be completed, including the reconstruction and widening of the Bow Bridge, and an important widening of Belgrave-gate. A new sanatorium and hospital block will be completed in the spring. New public conveniences for both sexes are to be erected in the Newarke.

Leiston-cum-Sizewell (Mr. Robert E. Wilson, M.I.M. and C.E., A.R.San.I., water engineer, surveyor and inspector to the urban district council.)—During the past year the new water supply scheme has been completed, also improvements at the sewage works. Sanction has been obtained from the Local Government Board for the erection of fifty workmen's dwellings on the Grimsey estate. The fencing and laying out of new cemetery will be carried out during the ensuing year, together with various street improvements, and the tar-painting of main streets. The question of purchasing horses and carts for the removal of house refuse by the council is being considered.

Leitrim Co. (Mr. E. O'N. Clarke, county surveyor). Improvement of roads approved of by the Road Board already in hand in the neighbourhood of Carrick-on-Shannon and Manorhamilton will be proceeded with. New road and bridge approaches at Hartley, Carrick-on-Shannon, will be completed. Upwards of 7 miles of new roads are at present under construction, and 9 miles more have been approved of. These are, generally speaking, in mountain districts, and cost about £280 per mile.

Lichfield (Mr. Percy V. Benn, A.M.I.C.E., city engineer and surveyor).—The work intended to be taken in hand by the city council during the coming year includes the erection of twenty workmen's dwellings, together with road making and drainage in connection therewith, the plans for which have been pre-

pared. Various road surface improvements are in contemplation, as also the widening of a portion of Lamworth-road, and the easing of a dangerous corner on the London-road. The rebuilding of a sanitary convenience will also be considered, as also the question of municipal offices.

Lincoln (Mr. R. A. M[illegible], M.INST.C.E., engineer, surveyor, [illegible] surveyor).—[illegible] on the river are contemplated, as well as the construction of another one at the east end of the city. Arrangements will probably be completed with the Road Board for the tar-macadamisation of the roads entering the city; four are done, and three remain to be done. The council are proposing [illegible] an outer one—at the north end of the city, and they hope to make a commencement during the year. In connection with these roads a town planning scheme is contemplated, and sanction has been obtained from the Local Government Board to prepare a scheme. Embraced in this town planning scheme is an area of 67 acres, which the corporation have purchased, for the construction of 800 or 900 workmen's houses. It is hoped to commence this scheme unless the war prevents it. The corporation are promoting a Parliamentary Bill for, among other things, freeing the commons from the Freemen's grazing rights, to run motor omnibuses or trolley vehicles, and additions to the electricity station, and also to obtain powers respecting streets, buildings and sanitation.

Liverpool (Mr. John A. [illegible], M.INST.C.E., city engineer).—The more important works in progress in the city engineer's department include the widening of a main approach to the city to 120 ft., 2 miles in length, with fenced-in tramways laid in grass; the completion of construction of portions of new wide road, Queen's-drive, and subway under railway; the construction of a northern outfall sewer, 2 miles in length, 9 ft. and 8 ft. in diameter, at considerable depth; the construction of southern relief sewer, 6 ft. by 4 ft. 6 in. in diameter; the construction of wider bridge over [illegible] and North-Western [illegible] in connection with subway, Queen's-drive, Mossley Hill; the reconstruction of large area of street pavements, consisting principally of substitution of pitch-macadam for boulders; and the construction of underground conveniences. The works in progress or proposed to be carried out during the year in the water engineer's department include the construction of filter-beds at Llanforda, near Oswestry, Salop, and the construction of clear water tank at Chorley, Lancs.

Liversedge (Mr. A. Rothera, M.I.M. and C.E., engineer and surveyor to the urban district council).—During the year the most important event likely to be accomplished will be the union of the three urban districts of Liversedge, Cleckheaton and Gomersal in one large urban district to be called Spenborough. The Order has been made by the county council of the West Riding of Yorkshire, and now only needs the confirmation of the Local Government Board to make it operative. The new urban district will be the largest in Yorkshire, so far as population is concerned. The sewage works, it is thought, will be completed, which will put Liversedge in possession of some up-to-date works, and, incidentally, the proposed new district, so far as the greater portion of the Cleckheaton and Gomersal sewage is concerned, is now treated by Liversedge. It is proposed to lay out the market site as a park and recreation ground, and also to put in order various adjacent private streets, plans of which are now before the board, the total estimate amounting to £2,777. Various schemes for the improvement of corners adjoining important main roads are now before the Road Board for their consideration, the cost of which is estimated at £137, while a plan for the widening of part of Bradford-road, a very important thoroughfare, to a width of 50 ft., at an estimated cost of £5,383, is now being considered by the same authority, and if carried out will constitute one of the best improvements effected in the district. No doubt, when the new district is formed and details settled, important public developments will take place in Spenborough, which is the centre of a very busy manufacturing area.

Llandudno (Mr. E. P. Stephenson, engineer and surveyor, Mr. W. T. Ward, deputy engineer and surveyor to the urban district council).—The principal works will be the construction of the new golf links designed by Mr. R. J. Colt, of Sunningdale; Queen's-road widening and improvement, completion of the new sewers, replacing old sewers, in the Craig-y-don district; the erection of sixteen new workmen's dwellings; further extensions of the improvements in the Happy Valley Pleasure Grounds; additions to the gasworks plants and buildings, and an additional trunk main; extension of the sewers to the gas and electricity works; extension of the water distributing mains; and the new through road from Llandudno to Colwyn Bay.

London, Camberwell (Mr. William Oxtoby, M.INST.C.E., borough engineer).—Owing to the unsettled condition of things through the war, no special works are contemplated during the present year.

London, Deptford (Mr. J. Sutcliffe, Assoc.M.INST.C.E., borough surveyor). — The council have decided to make up unpaved portions of the following streets—viz., Arica-road, Avignon-road, Finland-road, Revelon-road, St. Norbert-road, White Post-lane (Old Kent-road), and the whole of Troutbeck-road. Baths and wash-houses and library are to be erected in Evelyn-street, and slipper baths in Ilderton-road. Several macadam roads are to be converted to various types of permanent paving. In resurfacing certain [illegible] and all water-bound macadam roads are to be tar-sprayed after the next recoating. Additions are to be built to the superintendent's lodge at Brockley cemetery. A small public convenience is to be constructed at Brockley, and new stores and convenience at St. Paul's Churchyard. Alterations and additions are to be made at the council's depot, Knott-street.

London, Finsbury (Mr. P. G. Killick, borough surveyor).—It is not anticipated that any very extensive works will be carried out during the year, with the exception of repairing several streets with creosoted deal paving, and probably a few macadam streets with bituminous material, and the reconstruction of two or three sewers. The leases having fallen in on a large portion of the Marquis of Northampton's estate, considerable improvements are likely to be carried out before rebuilding. The Metropolitan Water Board offices in Rosebery-avenue will be commenced during the year, and an improvement effected in connection therewith.

London, Holborn (Mr. E. F. Spurrell, borough surveyor).—The council will during the year carry out works of repaving roads and reconstructing sewers, but the list has not yet been decided upon. The only other work the council will undertake is the erection of workmen's dwellings on a site near to Seven Dials.

London, St. Pancras (Mr. Wm. Nisbet Blair, M.INST.C.E., borough engineer and surveyor).—The estimates already approved extend up to March 31st, and nothing can yet be said as to what may be done during the rest of the year.

London, Woolwich (Mr. J. Rush Dixon, M.INST.C.E., borough engineer and surveyor).—Extensive road widenings and improvements will be proceeded with in connection with the construction, by the London County Council, of an overhead electric tramway to link up and do away with the existing terminus at Lee Green and High-street, Eltham. The resurfacing of motor-'bus routes will be continued. A sewerage scheme, with a view to flood pre-

Woolwich, in Woolwich and Plumstead, estimated to cost £9,000, has been approved, and will be carried out by direct labour. Owing to war requirements, the Government has requisitioned a number of horses, and the council's staff has been greatly depleted thereby, with the result that further mechanical traction for scavenging and the haulage of road materials will have to be considered. There has been a large influx of workers to Woolwich Arsenal, and this has resulted in a great scarcity of housing accommodation, which is now receiving the serious consideration of the council, with a view to further houses being erected. With a view also to relieving possible distress arising in the borough as a consequence of the war, road improvements and widening schemes have been prepared for Bexley-road, Eltham, and will be undertaken if necessary with the assistance of the Road Board, at an estimated cost of £13,000. The extension by the Port of London Authority of the Royal Albert Docks at North Woolwich is proceeding. In addition to the usual sewerage and private street works, there will, no doubt, be increased activity in the development of the several extensive building estates in the borough.

Louth (Mr. Thomas Walsh, county surveyor).—The principal works projected by the county council at present are: The improvement of Dublin—Belfast road (£10,900); the erection of county buildings at Dundalk (£6,000); erection of roads stores at Carlingford Harbour; and completion of pier and harbour at Hunterstown, with some other works on local roads.

Lowestoft (Mr. G. H. Hamby, Assoc.M.Inst.C.E., borough surveyor). The war has not materially altered the prospective programme of work of development in the borough. Schemes have been expedited which require a large proportional amount of labour, in view of possible eventual unemployment in the town. Works of sewerage, including rising mains and pumping stations, to cost about £11,000, have been sanctioned, and are ready to be commenced. A scheme for the improvement and resurfacing of roads in the borough, now submitted by the council with a view to them being declared main roads, and costing £10,000, is under negotiation, and will probably shortly be put in hand. Reinstatement of several timber groynes on the North and South beaches, rendered necessary by the existing timber having worn out, has been found necessary, and a comprehensive scheme, involving the spending of several thousand pounds, is in course of preparation. Application has been made to the Local Government Board for the borrowing of £2,000 for the making up of Iceworks-road, and the sheet piling of Waveney-drive Embankment, rendered necessary by the erection of a new factory and quays at this spot. These, together with the making up of some score of private streets, will probably be the limit of municipal activity in the borough during 1915.

Luton (Mr. J. W. Tomlinson, borough engineer and surveyor).—Extensions of the sewage disposal works will be completed, and new sewage pumping plant will be installed. The new refuse destructor will be proceeded with, and should be in operation by autumn. The new infectious diseases hospital will be commenced, and it is hoped to have part of the buildings in use before the end of the year. Two railway bridges, involving an expenditure of £15,000, will probably be built, a girls' secondary school will be provided, and an elementary school will also be erected.

Lytham (Mr. A. J. Price, surveyor to the urban district council).—A Local Government Board inquiry into the purchase of the existing council offices, baths, and public hall, with a view to rebuilding them on more modern lines, and the construction of a marine lake and bathing pool on the foreshore, was held recently, and it is hoped to be able to commence the construction of the marine lake and bathing pool some time this year. The plans for the marine lake and bathing pool, which have been approved by the council, provide for the enclosure of some 25 acres of the foreshore, and the cost of the lake and bathing pool is estimated at £16,500. The West End sewerage scheme should be completed in the summer, and several other smaller sewerage schemes will be carried out. A number of private streets are to be made up, and the use of tar-macadam on the principal roads is to be extended. It is hoped to widen from 20 ft. to 60 ft. a portion of the main approach road from Preston, within the Lytham area. A town planning scheme for the district is now being prepared. The electricity scheme, for which the Local Government Board have been asked to sanction a loan of £2,500, is at present held up owing to a dispute with St. Annes over the question of supplying current to the local tramway company, but it is hoped that matters will be amicably settled, and the work commenced shortly.

Macclesfield (Mr. S. C. Bayliss, M.I.M. and C.E., borough surveyor and waterworks engineer). In connection with the waterworks extension scheme, provision will be made for an additional water supply and impounding reservoir. Additions to the sewage disposal works, comprising percolating filters, humus tanks, and pumping machinery, will be made. The contract for additions to the borough isolation hospital, amounting to about £8,000, is expected to be let during the year. Further private street works, sewering, surface-water sewering, roads improvement, and the laying of granited rock asphalt roads, will be the chief work of the highway department. In addition, the Oxford-road Bridge will be completed.

Malvern (Mr. Wm. Osborne Thorp, surveyor and waterworks engineer to the urban district council).—The work of remaking some 2½ miles of roads in the district is now in hand, so as to relieve those portions of existing heavy traffic, which they are continually subjected. The roads are being excavated to a depth of from 15 in. to 18 in., packed with block stone, and coated with 6 in. of Clee Hill stone. Progress is also to be made with the main outfall sewerage scheme sanctioned by the Local Government Board, and several new lengths of 4-in. and 6-in. water mains will be laid during the year. Extensions at the electricity works are in hand.

Market Harborough (Mr. H. G. Coales, Assoc.M.Inst.C.E., F.S.I., engineer and surveyor to the urban district council). In view of the war, the council does not propose to carry out any new work that is not absolutely required, although the council had under consideration a town planning proposal, with certain street widenings.

Mansfield (Mr. Thos. P. Collinge, Assoc.M.Inst.C.E., borough engineer and surveyor). Further progress will be made with the scheme of road reconstruction in tar-macadam under the Road Board scheme. The work is to be carried out in two years, at a cost of £5,724. A number of roads will also require new foundations and reforming, owing to the heavy traffic to the military training camp at Clipstone. It is proposed to enlarge the sewage disposal works at Mansfield and Pleasley Hill, and construct new sewers at Pleasley Hill, at an estimated cost of £1,300. A length of sewer 3 ft. in diameter is to be constructed in Chesterfield-road, at an estimated cost of £1,500. A housing scheme has been approved by the council, and plans for the erection of forty workmen's dwellings have been forwarded to the Local Government Board. Progress is also being made with two town planning schemes which embrace the whole of the undeveloped land in the borough. Several streets are to be made up under the Private Street Works Act, and further road widening will be carried out under a Provisional Order. A tender has been accepted, amounting to £4,189, for additions to infectious hospital, and this work is now in hand. Part of the town hall premises will be altered and converted into more commodious offices for the borough surveyor's department. A

site has been purchased for the erection of a technical school, and new council schools are to be erected in Chesterfield-road.

Marlborough (Mr. G. PARKER PEARSON, ASSOC. M. INST. C. E., borough engineer and surveyor). In all probability an important road widening and improvement scheme will be carried out. The main roads will again be treated with a dust preventative material. Further lengths of defective and leaky stoneware-pipe main sewers will be taken up and relaid, and, in waterlogged ground, cast-iron pipes substituted. The extensions of waterworks, including new reservoir, engine-house of pumping station, new engines and pumps, now in hand, will be completed in the course of the year. Numerous repairs will be done to corporation property.

Marple (Mr. D. J. DIVER, engineer and surveyor to the urban district council).—In addition to the ordinary routine works, the following works will be carried out this year—viz., sewering Windlehurst-road; widening Windlehurst-road; new 6-in. water main from Moseley Brow to Market-street; sewering the Low Marple portion of the district; and making up Derby-street, St. John's-street and East-vale.

Matlock (Mr. JOSEPH TURNER, surveyor and waterworks engineer to the urban district council).—The council are negotiating for the purchase of a strip of land at the junction of two important highways for road-widening purposes. They have also decided to construct an additional water-storage reservoir to supply the district situate on the high levels. No other works of any moment are projected, except in the ordinary routine work of maintaining the main and other roads. The main sewerage scheme is being proceeded with.

Meath (Mr. JAMES QUIGLEY, county surveyor).—All roads, 1,603 miles, are now maintained by direct management, or direct labour, as it is styled by the Irish Local Government Board. During 1915 arrangements will be made for rolling all broken stone, so that, except on hilside roadways, no more raw metal will be spread. A grant of £3,679 has been obtained from the Road Board, and the county council have added an equal sum, £3,679, for improving the surface of certain main roads by metalling, rolling, and tar-painting. This work is already well advanced, and will, it is hoped, be completed by about September next. Last year the expenditure was for maintenance, £24,980; for improvement, £4,550.

Meriden (Mr. THOMAS HENRY NIGUS, M.I.M. AND C.E., district surveyor to the rural district council).—Although several sewerage and water schemes involving an expenditure of some £30,000 have been sanctioned by the council, and the plans of same are nearing completion, it is very doubtful if more than one-third will be proceeded with during the continuation of the war.

Middlesbrough (Mr. S. E. BURGESS, M.INST.C.E., L.R.I.B.A., borough engineer and surveyor).—The first portion of the Snowdon-road main drainage scheme (estimated cost £33,850) is well in hand, and no doubt will be completed during 1915. The total estimated cost of the entire scheme is £60,000. It is proposed to improve the main drainage system of North Ormesby recently included in the borough boundary of Middlesbrough), and a scheme is now being prepared. The following works have also been under consideration, and will in all probability be put in hand during the year—viz., Acklam-road and West-lane widening improvement; Marton-road widening; Parliament-road corner improvement; new isolation block to sanatorium, West-lane; laying out of recreation ground (Ayresome district, 7½ acres in extent), with the provision of swings, giant strides; extension of public swimming baths; bridge for vehicular and pedestrian traffic over North-Eastern Railway level crossing. Schemes have been adopted under the Housing and Town Planning Act, 1909, for dealing with the insanitary property in the borough, and further schemes are being prepared. Repairs to insanitary property (in cases where owners have failed to undertake repairs in accordance with notices served) are also to be carried out by the corporation, and the cost will be claimed from the responsible owners. Under powers granted to the corporation by the Bill passed in the last Session of Parliament, the toll-bar roads are now under the jurisdiction of the corporation, and consequently additional road paving works will be involved. Private street improvement works will proceed as usual (estimated cost £10,000), also the abolition of privy middens and pan closets, and conversion into water-closets (estimated cost £12,000).

Middleton (Mr. W. WELBURN, M.I.M. AND C.E., borough surveyor).—The following works are in hand, and under consideration—viz., main road widening, £6,000; new street, Gonclough, £4,000; new street off Boarshaw-lane, £4,800; new bridge over river, £1,030; new main sewers, £3,840; private street works, £1,800; workmen's dwellings, £5,000; new town hall (under consideration), and new baths (under consideration). The greater portion of the above will be carried out during the year.

Montgomery (Mr. G. A. HUTCHINS, M.INST.C.E., county surveyor).—New works proposed to be carried out in Montgomeryshire during 1915, in addition to ordinary main roads, bridges, and buildings, maintenance and improvements, are about 4 miles of tar-macadam road surfacing, 2 miles of tar-spraying, and eight dangerous corners improved. In the education department, new schools have been proposed for Hirnant, Rhosybrithdir and Esgairgeiliog. In addition, several existing schools will be improved.

Morecambe (Mr. J. W. HIPWOOD ASSOC.M.INST.C.E., borough engineer and surveyor).—Owing to the war, the proposed widening of Poulton Bridge, estimated to cost £15,000, has been postponed. The town is being utilised by the military authorities for the training of four Manchester battalions, 5,000 strong. Improvement schemes are therefore suspended until the termination of their training. A special Parliamentary Committee has been appointed with a view to promoting an omnibus Bill in Parliament, including tramway reconstruction work and promenade extensions. Minor improvements are being proceeded with.

Morpeth (Mr. J. DAVISON, borough surveyor).—During the ensuing year it is expected that a new scheme for the provision of workmen's houses will be proceeded with, the council having agreed to purchase 6 acres of land adjoining High Stanners, on the west side of the town. The widening of roads and cutting off dangerous corners will also be undertaken in the early part of the year. The occupation of the borough hall as a military hospital has prevented the carrying out of the seating and furnishing of the hall. The erection of a quay wall at the riverside, and making up the roadway at Bays Land has been postponed on account of the heavy expenditure during the war. Possibly private street works will be carried out in other parts of the town during the year.

Neath (Mr. D. M. JENKINS, ASSOC.M.INST.C.E., borough engineer).—The works carried out during the past year, and in course of completion, include a service reservoir; mains and fittings for auxiliary water supply; various works in connection with the existing water undertaking; road widenings; council school extensions; and workmen's dwellings. During the current year the contract for ninety-three houses is expected to be completed. Alterations to and extensions of the borough police station will be proceeded with, and a number of private street works will be carried out. Considerable extension of electrical distributing mains are contemplated, and among other works expected to materialise are

an open-air bath and further road widenings and street improvements. The corporation have also under consideration the resurfacing of main traffic roads with asphalt or other special material, to meet the requirements of the constantly increasing heavy motor traffic.

New Malden (Mr. Reginald H. Jeffes, assoc.m.inst.c.e., engineer and surveyor to the urban district council).—The principal works which will be carried out during 1915 are the erection of a three-cell refuse destructor; making up of private streets, and laying surface-water culverts in connection therewith; and the extension of buildings, cart sheds, steam-roller shed, and other works at the depot adjoining the council offices. Application has been made to the Local Government Board for permission to prepare a town planning scheme for the district. The other works will be mainly of a routine character.

Newport Pagnell (Mr. C. A. Branford, surveyor and sanitary inspector to the urban district council).—The various works contemplated by the council during the ensuing year are street improvements and an addition to the town water supply. Boring for water has commenced.

Norfolk (Mr. T. H. B. Heslop, m.inst.c.e., county surveyor).—In addition to the ordinary work of maintenance of the 1,412 miles of rural main roads under direct control, there will be considerable lengths of flint-surfaced roads reconstructed in granite. Improvements will be carried out by removing dangerous corners and widening narrow places, more especially upon the coast roads. About 80 miles of road will be improved for military purposes. In order to relieve distress caused by unemployment owing to the war, a large scheme of road widening in various parts of the county has been sanctioned by the authorities, and will be put in hand when distress arises. About 720 miles of road will be surface-tarred. Short lengths of "permanent" macadam surfaces will be laid down, and the general work of repairs to the 614 county bridges will be carried out. The existing private bridge across the river Ant at Ludham will be rebuilt, and subsequently taken over as a county bridge. The joint bridge at Mendham will be completed. Schemes will be prepared for bridging some of the remaining fords on the county main roads. The usual work of renovation and repairs to the county asylums, police stations, shire halls, and roadmen's cottages will be undertaken. New kitchens and nurses' accommodation will be completed at the asylum, and possibly the reconstruction of the drainage system undertaken. The building of further cottages for the police and county roadmen will be considered. Increased accommodation will be provided at one or two of the smaller police stations. The internal decorations of the Norwich Shirehouse, which has recently been restored and refronted, will be undertaken.

Northampton (Mr. Alfred Fidler, m.inst.c.e., borough engineer and surveyor).—The works under consideration for execution during the year comprise: Workmen's dwellings; pavilions at infectious diseases hospital; public baths; main drainage works; and road improvement schemes, including an important road towards which the Road Board have made a substantial grant. It is expected that the tramway extensions, which have been under construction in Kingsthorpe and Far Cotton districts, will be completed and in full operation early in the year.

Northamptonshire (Mr. C. S. Morris, county surveyor).—The present will be a busy year in this county. In addition to the repair of 320 miles of main roads, the widening and resurfacing of 40 miles of main roads now traversed by motor-'bus traffic will be in hand. A scheme for widening 126 corners on the main roads, and 281 corners on the district roads, at an estimated cost of £6,500, has been approved by the Road Board, who have made a grant of 75 per cent of the estimated cost (exclusive of land). The works have been commenced, and will continue throughout the year. The widening of Manor House Hill at Irthlingborough, at a cost of £1,200, will also be taken in hand, in addition to many other schemes of road widening and improvement. Schemes are in preparation for the widening and strengthening of several county bridges; of which there are 235 in the administrative county. The enlargement of Wellingborough police station, including the provision of two new courts, new cells and a mortuary, at a total estimated cost of £7,000, is in hand, and the work is expected to be completed by the end of the financial year 1915-16. The council have purchased a large block of buildings adjoining the county hall, with a view to the provision of additional offices for the staff, and the plans and specifications for this work are being prepared.

Norwich (Mr. Arthur E. Collins, m.inst.c.e., city engineer).—It is anticipated that the following municipal works will be commenced, proceeded with, or completed during the next twelve months—viz.: An application for Parliamentary powers for widening and deepening the river Wensum through Norwich. The proposed minimum width of river is 80 ft. The proposed depth is 17 ft. below mean water level between Foundry Bridge, the nearest fixed bridge, and the sea. Above this bridge 10 ft. depth is proposed. The scheme includes constructional works in respect of seven bridges. If distress labour requirements have to be met, it is possible to employ a considerable number of men on suitable portions of this scheme. The estimated cost of the portion now contemplated is £140,000. There is an ultimate scheme for widening and deepening about 23 miles of river between the city, at Foundry Bridge, and Breydon Water, near Great Yarmouth, at a further cost of about £200,000. A commencement will be made with the erection of additions to the municipal offices. For the cost of this work the Local Government Board has given its consent to raising a loan of £12,800. Following on the purchase of 130 acres of land on the north-west side of the City Asylum, progress will be made with plans for great extensions of that institution. Further consideration will be given to a scheme for erecting cottages and flats for the working classes in the northern portion of the city to provide housing necessitated by the demolition of houses in ancient courts and yards. The proposals at present being reviewed, including the clearance scheme, are estimated to involve an expenditure of about £10,000. Accommodation has to be provided for 115 persons. Plans and estimates are being prepared for the conversion of the riverside site of another clearance area into a macadam and wharf and refuse-loading dock. The proposals include the removal of old buildings, constructing electric transporter and storage hoppers from which to load steam wagons by gravitation in a few seconds each, dredging river, and constructing river wall. A contract has been let for adapting a former eye infirmary to the purposes of a tuberculosis dispensary, and the works are now commencing. Further progress will be made with the substitution of a bituminous macadam for ordinary macadam. The further assistance of the Road Board will be sought in the endeavour to continue to improve the status and convenience of main roads by the provision of this material. A roadway adjoining Wensum Park will be widened, and fencing and planting adjoining the widening will be effected as adjuncts thereto. It is expected to complete the extension of Unthank-road storm-water relief sewer (estimated cost £3,000), and thereby complete the last important link of the main surface-water sewerage of the south-western area of the city. The war and the possibility of raid or invasion affects the work of the department in organising help to the population if required.

Nuneaton (Mr. F. C. Cook, assoc.m.inst.c.e., borough surveyor and water engineer).—The works contemplated for 1915 comprise the conversion of contact beds into percolating filters at the sewage outfall works; the construction of 24-in. storm-water sewers for Coton-road district; the erection of public mortuary; the laying out of addition to Riversley Park; completion of the Newdegate Corner improvement, at a cost of £8,500; and other street improvements. The

Council have adopted a housing scheme providing for the erection of eighty-three houses, but it is held up owing to the war. The art gallery and museum [illegible] by Councillor Mellr, will be opened during the year.

Nottinghamshire (Mr. E. P. Hooley, M.Inst.C.E., county surveyor).—Plans have been prepared and submitted for a further extension of the county asylum at Radcliffe-on-Trent, this being the second extension within three years. Sites have been, or are being, obtained for the erection of [illegible] at Bassetlaw, Worksop, Carlton near Nottingham and Mansfield. Work [illegible] and other improvements are being carried out under Road Board grants, and [illegible] the proposed erection of 20 miles of rural main roads and the other for the reconstruction of 24 miles of urban main roads. Both are in Tarmac, and the completion is to take place in three years. One-third of the work will be completed by March 31, 1915, and it is anticipated that of the remaining portion one-half will be completed during the ensuing year.

Oadby (Mr. William Bell, engineer and surveyor to the urban district council).—It is proposed to erect primary and secondary filter-beds at the sewage works, owing to the unsuitable nature of the land, and the small [illegible] the effluent discharges. Additional pumping plant will be installed for the [illegible] level field, and the conversion of the present tanks into storm-water tanks. In connection with this scheme it is proposed to sewer the Wigston-road area, and thus reduce the use of cesspools in the district to a minimum. The council are also considering the taking over of the whole of the private streets in the Stoughton estate, which were recently made up, also the making up of several other streets in the district, and various other improvements to the Wigston and Stoughton roads, after the laying of the sewerage. It is intended to have a new heating apparatus for the public baths.

Okehampton (Mr. D. V. Howard, borough surveyor and waterworks engineer).—As far as can at present be ascertained, the following matters will receive the attention of the town council during the coming year: Extensions of and additions to the pen accommodation of the cattle market, and the provision of an auction ring in the market; the provision of hot water heating apparatus to, and the laying of a wood-block floor in, the market hall; scraping internally some of the existing water mains, and taking up and relaying the existing mains (which have been laid over forty years) in a large number of streets in the borough; and a scheme to increase the flow into the water supply storage reservoir, and repairs to the reservoir. The council have purchased a site for the purpose of erecting new public buildings.

Ossett (Mr. H. Holmes, M.Inst.C.E., borough surveyor and water engineer).—The early part of the year will see the completion of the extensions to the Storrs sewage works, including [illegible] ing new precipitation tanks and percolating filters. Many private street improvement works are in preparation, and these will be proceeded with at the end of the war. A new elementary school, to accommodate 450-500 scholars, is to be built, and the grammar school premises are to be extended. A surface-water sewerage scheme is to be prepared during the year, and there is every prospect of a town planning scheme, embracing at least one large area in the borough being taken in hand. Regulations have been prepared under the Ossett Corporation Act, 1914, and steps are to be taken to regulate the discharge of trade effluent into the sewers, and to make a charge for treating same. There will be the usual maintenance and routine work in the water department, and further extension of the mains where new buildings demand it. The usual maintenance of the highways includes tar-painting and the laying of tarred slag on both main and district roads. The revision of the building by-laws are now well in hand.

Oswestry (Mr. G. William Lacey, borough surveyor and water engineer).—Apart from routine work and some private street works, it is not anticipated that any large special works will be undertaken. It has been decided to postpone the proposed reconstruction of the service reservoirs for the present on account of the war. A large military camp is being established on the outskirts of Oswestry, and in addition it is proposed to billet a considerable number in the town. The swimming baths are to be opened for the season free of charge, and the presence of troops will naturally add a good deal to the supervision and routine work of the town.

Oxford (Mr. W. H. White, M.Inst.C.E., city engineer).—Among the works undertaken during the [illegible] a considerable outlying suburb, and its connection with the city [illegible] farm under-drainage system and of the city sewers and water mains; improvements of the pumping machinery; and the [illegible] sewer [illegible]. New [illegible] omnibus service has been established throughout the city under Parliamentary powers, the tramway track will be removed, and a complete scheme carried out for re-making and improving the roads traversed by the lines. An application has also been made to the Road Board in connection with a scheme for re-making all the main suburban roads.

Penrith (Mr. J. J. Knewstubb, A.R.I.B.A., M.R.San.I., engineer and surveyor to the urban district council).—The council's works for the ensuing year are not yet decided upon, and it is as yet difficult to say, considering all the circumstances [illegible]. The chief works will probably include the planting and laying out of about 7 acres of ground adjacent to Penrith Castle as a public park. The Castle itself is under the control of H.M. Office of Works, and works of excavation and preservation will also be proceeded with in connection with the structure.

Peterborough (Mr. J. W. Walshaw, city surveyor).—A new cemetery is in course of construction, and will be proceeded with during the spring. The cost of the land, 47½ acres in extent, has been £5,000, and a like amount will be expended upon the drainage, laying out, planting, buildings, and fencing of about 10 acres. A further extension of the surface-water drainage scheme in the borough will be proceeded with, and concrete in situ footpaths put down. A public urinal will be constructed, the cost of which will be £100. The fitting up of eight slipper baths for the soldiers which are now billeted in the city has been completed. Should the accommodation be found insufficient, a further number of baths will be fixed.

Portsmouth (Mr. Arthur W. Ward, Assoc.M.Inst.C.E., borough engineer).—The scheme for enlarging the infectious diseases hospital is now so far forward that the quantities have been taken out and the work advertised. Several schemes for works have been discussed, but, owing to the war, these will probably not be decided on at present.

Prescot (Mr. Richard Norris, A.R.San.I., surveyor to the urban district council).—Early in the year the new roadway from the station to the main road will be constructed. It is expected that twelve cottages will be completed at an early date. Improvements are to be carried out at the sewage works, consisting of providing tanks and weirs, and new single [illegible]. A new 18-ft. wide roadway will be made to the new gas works. The estimates for works on main roads have

not yet been submitted, but it is expected that these will include a number of sett pavements on concrete works. A scheme has been submitted to the council for converting 800 privies in the town into water-closets, and it is likely that the work will be carried out during the year. It is proposed to make up a number of back passages by paving under the Private Street Works Act, at an estimated cost of £600.

Preston (Mr. Thomas Cookson, borough engineer). Streets improvement, £13,000; widening of Glover's-court, £6,000; bowling greens, Ribbleton Park, £700; small-pox hospital, £2,100; sanatorium (including site of about 10 to 12 acres), £10,000. Tenders have been invited for the long-delayed baths (£20,000), and tramways offices and extension of car sheds (£7,000).

Prestwick (Mr. Frank Pritty, burgh surveyor).—The corporation are at present considering the necessity of providing increased clear water storage and filtering capacity. This will mean the construction of a clear-water tank giving five days' storage, and several sand-bed filters. The corporation have recently purchased property in the main street to effect a road widening and improvement, and it is proposed to build properties on the ground which remains after this improvement has been effected. Negotiations are proceeding for the construction of several new streets as private improvement works.

Pwllheli (Mr. C. L. Roberts, borough surveyor and water engineer).—During the year the west end and south beach promenades will be joined. This work entails the erection of a sea wall, and the formation of a parade and roadway, which is estimated to cost £4,000. The length of the promenade will be about ¾ mile after the work now in hand is completed. In order to relieve the distress in the neighbourhood arising out of the war, the work is being carried out by direct labour, and a substantial contribution towards the cost has been promised by the Road Board. The question of providing workmen's dwellings is becoming a serious one, and no doubt some definite steps will be taken in the matter.

Ramsgate (Mr. T. G. Taylor, borough engineer). The works projected in Ramsgate during 1915 include the following: Extension of bathing station and sea-bathing arrangements generally; lavatories (ladies' and gents'); important street widening works; relaying the considerable areas with wood paving; shelters on West Cliff, and improvement of road surfaces.

Rawmarsh (Mr. J. A. Tongl, engineer and surveyor to the urban district council). The works contemplated include a new sewage scheme for the South Ward of the parish and a new refuse destructor. Many new street works have been carried out under the Public Health Act and Private Street Works Act, and extensive street widening and paving works on main roads; also additions to gasworks offices. Considerable painting and decorative contracts and much routine work will be put in hand.

Rawtenstall (Mr. Jas. Johnson, borough engineer and surveyor). During the year the bowling green in Whitaker Park, which was projected to provide work for persons thrown out of employment by the war, and the main sewers in Bury-road and Townsendfold, will be completed. Surface-water drainage of the main roads will be proceeded with, in connection with which about 6 miles of 12-in., 9-in. and 6-in. sewers and drains will be laid. An important widening of Burnley-road East will be proceeded with. Ewood Bridge-road will be reconstructed. The question of the reconstruction of various main roads with granite setts will be considered. Several private streets will be sewered, paved and flagged. The Health Committee are considering the desirability of erecting more cottages for the housing of the working classes in the eastern part of the borough, and the scheme may develop. It is probable that new conveniences will be erected at Crawshawbooth.

Redcar (Mr. J. Howerott, engineer and surveyor to the urban district council). The works contemplated are: Private improvement works; shaft and borehole, and pumping apparatus at waterworks; and new water mains.

Rochdale (Mr. S. S. Platt, M.Inst.C.E., F.R.San.I., borough surveyor).—It is intended, during the coming summer, to proceed with the work of construction of the second portion of the extensions at the sewage disposal works at Roch Mills, consisting of a further thirteen revolving percolating filters, 72 ft. in diameter, 9 ft. deep (making twenty-six in all), having gas coke, 1¼-in. gauge and above as a medium, so as to enable the volume of sewage up to three times dilution to be treated (about 7,000,000 gallons per day). The scheme also includes the duplication of the main outfall, so as to be capable of delivering six times the normal flow, with allowance for future increase. The first portion of the extensions referred to—they are illustrated in The Surveyor of June 20, 1913—has given very satisfactory results, the effluents being well within the requirements of the Mersey and Irwell Joint Committee. The conversion of pail-closets in the borough to the water-carriage system is progressing, one result being an increasing amount of precipitated sludge at the sewage works, and the question of its disposal is requiring reconsideration. At present the sludge is dealt with in six filter presses, and the disintegrated sludge cake is given to farmers; but the difficulty of disposal locally is becoming more accentuated, and the corporation have entered into an agreement (and the work is now in progress) for the installation of an experimental plant for the recovery of grease from the precipitated sludge, and the production of a fertiliser containing not more than 10 per cent of moisture of greater manurial value than ordinary sludge cake obtained by pressing. A sanatorium of forty-eight beds and ten shelters is to be provided for tubercular cases on an estate of 100 acres at Springfield, recently acquired by the corporation. A necessary addition is to be made to the tramway department by the erection of repair shops and car shed on lands of the corporation adjacent to the present offices and depot, at an estimated cost of £17,000. The extension will be proceeded with of the ferro-concrete covering of the river Roch, to a distance of 30 yds. opposite the town hall, alongside the site of a new general post-office, the erection of which is expected to be commenced this year. With a view to finding work for unemployed, plans and estimates have been submitted to the Local Government Board, and their sanction obtained, for the construction of two bowling greens and some levelling on one of the recreation grounds of the corporation, but the immediate carrying out of these works will depend on the amount of distress prevalent in consequence of the war. At present there is no marked distress. The construction of a new main road, 20 yds. in width, and about 1½ miles in length, between Castleton and Lowerplace, at an estimated cost of about £40,000, the plans and estimates for which are awaiting the approval of the Local Government Board, is in the same category as the works just referred to. Sundry street widenings are in progress and in contemplation. The second town planning scheme of the corporation, comprising about 1,600 acres, of which about 500 acres are in the area of two adjoining authorities, having received the authority of the Local Government Board, the corporation will now proceed to the next stage, viz., the preparation of a scheme.

Rotherham (Mr. Ernest B. Martin, M.Inst.C.E., borough and waterworks engineer). The works contemplated for the present year include numerous private street works and the construction of a new 60-ft. road through a part of the town. The improvement of several main thoroughfares, more particularly in College-square, will be carried through. The sewage disposal works will probably be extended by constructing further percolating beds and the construction of detritus tanks. The corporation are considering a small housing scheme and the preparation of a town planning scheme. The tramway system will probably be extended under powers now being sought in Parliament, and existing powers for the laying of a short tramway in the centre of the town will probably be exercised. Extensions to the car sheds and electric power station are approaching completion. The removal of the cattle market from its present site to one alongside the river will probably be taken in hand. Extensions to the waterworks are now taking place

by direct labour, and a new reservoir, with a capacity of 1,000,000 gallons, is being provided [illegible] with a small pumping station.

Rugby (Mr. JNO. H. SHARP, water engineer and surveyor to the water district council).—The past year has been one of considerable activity, particularly in respect of building operations and the opening up of new building estates, one of which has been completely built up, two more are rapidly nearing that state. The opening up of these estates has involved about 3 miles of streets to the existing public highways of the district, bringing the mileage up to about 25 miles. Although 3 miles is a large mileage of main roads. The [illegible] in the district were tar-sprayed during the summer. It is expected they will be again so treated this season. Several lengths of tar-macadam have been laid down in the centre of the town, which has proved most satisfactory, and no doubt will be laid down to a greater extent as soon as the season is sufficiently advanced for the successful carrying out of this class of work. New pumping plant [illegible] turbo-pump by Messrs. Willans & Robinson, Limited, Rugby) was installed at the Avon waterworks pumping station, at a cost of £4,200, capable of pumping a minimum of 30,000 gallons per hour, and a maximum of 75,000 gallons per hour. This plant is giving good results. In addition to the ordinary routine (no little matter in a rapidly growing town of this description), the department has been responsible for the carrying out of many important municipal undertakings, which included large alterations and additions to the depot and fire station, the reforming and asphalting of the paths in the Caldecott Park, laying down of a bowling green, and the erection of a pavilion. Works which will be put in hand during the year 1915 comprise the erection of a disinfecting station. The type of disinfector which will be installed is the Alliott & Paton high-pressure machine, fitted with recording gauge and Formalin spray attachment. The projected schemes include the construction of two large filter-beds, 96 ft. by 50 ft., at the Avon waterworks, together with other works appertaining thereto, including retaining wall running alongside the bank of the river Avon, taking out existing supply pipes, and replacing with pipes and valves of a larger diameter, and the conversion of an existing primary filter-bed into a secondary one. Plans have been prepared for the erection of a public convenience for ladies and gentlemen, at a cost of £800, which work will be put in hand as soon as the sanction of the Local Government Board has been obtained. An inquiry has recently been held for the borrowing of £8,500 for purchase of about 34 acres of land, which will be laid out in allotments, cemetery, pleasure grounds, and a site for a building scheme for fifty-three cottages having 16-ft. and 18-ft. frontages. The preparation of the plans for the laying out of the estate together with the plans of the cottages, is well in hand. Extensive alterations and additions will be made to the cattle market, which will comprise the erection of twenty-two large sheep pens, eleven pig pens and shed, and twenty-two large cattle pens, the floor of standings and avenues being carried out in concrete. It is anticipated that the surface-water drains in certain parts of the district will be taken up and relaid. Part of this work is now in hand. Preparations have been made (if necessary) for carrying out a large amount of extra work for the relief of unemployed in the town caused by the war. This includes the construction of a new road, levelling of about 6 acres of land at the sewage works for irrigation purposes, improvements to various highways, footpaths, street corners, and other minor works.

Ruislip-Northwood (Mr. W. LOUIS CARR, M.I.M. AND CO.E., engineer and surveyor to the urban district council).—During the year the council propose carrying out the following works: Extension of sewage disposal works, £5,000; sewerage, £2,750; repair of old sewers; road widenings, £400; highway repairs, £4,000; tar-painting roads and paths; private street works; lay-out of recreation ground at Ruislip; scheme for the building of twenty-two workmen's dwellings; and the preparation of a further town planning scheme.

Ryton (Mr. JOHN P. DALTON, engineer and surveyor to the urban district council).—Owing to Captain Dalton being on service with the Territorial Force, and the present crisis, no works of a special character will be carried out during the coming year. A housing scheme was postponed indefinitely, but should matters [illegible] will be proceeded with [illegible] twelve months' time.

St. Annes-on-the-Sea, Lancs (Mr. J. STANLEY SAXTON, ASSOC.M. [illegible], engineer and surveyor to the urban district council).—The works proposed to be carried out at Lancashire's residential suburb, and one of the newest, pleasantest and healthiest coast towns in England, are of considerable importance. Ashton Gardens, purchased for £25,000, and presented to the town by Lord Ashton, will be laid out. In the centre of the gardens, occupying an elevated position, Ashton Hall is to be erected at a cost of £22,000. The building, which is of a very ornate design, will be magnificently situated, built of stone, surmounted by a dome, and is intended to be a summer pavilion, which can be adapted for stage plays in the winter. The gardens are being laid out at a cost of £13,500, and include an ornamental lake, artistic bridges, cascades, rock, flower and formal gardens, with carpet bedding, shrubberied walks, surrounded by high banks and cliffs, and it is hoped that the reflection of the hall and terraces in the lake will be a means of blending the whole scheme, and rendering it at once a complete example of architectural perfection and pictorial treatment. Plans have been approved by the Local Government Board for an open-air swimming bath on the [illegible] 200 ft. by 120 ft. wide. The scheme is estimated to cost £8,500, and includes dressing-rooms for ladies and gentlemen, café and lounge, and children's playground. A salt-water supply scheme is under consideration for watering the streets with salt water. Plans have been approved by the Local Government Board for a new drainage scheme to cost £40,000. Other works contemplated include depot buildings (£1,000), underground conveniences (£1,600), private street works (£15,000), destructor (£8,000), greenhouses (£300), ten tennis courts (£900), bowling pavilion (£250), North Promenade Gardens (£600), and various smaller schemes.

St. Austell (Mr. E. D. GROVES, M.I.M. AND CO.E., A.R.SAN.I., engineer and surveyor to the urban district council).—The work of street improvements and road widenings will be continued. Owing to unemployment, several schemes have already been started. The East-hill main road widening is being done, at an estimated cost of £525, which includes widening the road about 10 ft., and the construction of new footways. The kerbing and channelling will be of granite, with cement-concrete paths laid in situ. The High Cross-street widening and improvement has also been started. This has necessitated the demolition of six houses, the new frontage line being set back about 10 ft. The carriageway will be made to a width of 25 ft. throughout, and a new footway constructed with 12-in. by 7-in. granite kerbing and 14-in. channelling. The cost of this improvement, including compensation, will be about £850. These works are being carried out departmentally. The council's first housing scheme will be completed early in the year. The scheme was prepared by the surveyor to the council, and received the sanction of the Local Government Board without alteration. In laying out the site, care was taken to avoid a cold and mechanical uniformity. For this reason the houses are not placed fronting the adjoining roads, but some are arranged at angles to the others. The houses are arranged in five blocks, four of the blocks each having four houses and one having six houses—twenty-two houses in all. The houses contain living-room, scullery, with larder, coal store, cupboard and water-closet on ground floor, and three bedrooms on the first floor. The cost of the site was £307. The contract for buildings, sewers, roads and fencing is £4,594. The rent (on a self-supporting basis) is 5s. 4d. per week inclusive. The recreation and pleasure ground, which was presented to the town last year by Sir C. J. Groves-Sawle, Bart., is at present being laid out. Sir Francis Leyland Barrett, Bart., has given a large shelter for the grounds, which is being erected to the designs prepared by the surveyor to the council. A public convenience for the grounds is being erected by the council. A new street will be made up, the work being done departmentally. The provision of an isola-

tion hospital, also new depot and stables, are under consideration.

St. Ives (Mr. SIDNEY PALMER, M.I.M. AND CO.E., P.A.S.I., borough surveyor and waterworks manager).—The council are now carrying out extensive road widening and improvement works on the St. Ives—St. Just road, from just above the board school in the Stennack to the top of Trevalgan Hill. It is also intended to commence a new sea wall and roadway at the harbour.

Saxmundham (Mr. J. E. HATTERSLEY, M.I.M. AND CO.E., engineer and surveyor to the urban district council).—The council's works for the year 1915 will include the completion of a new waterworks, pumping station, and the laying of cast-iron water mains and fire hydrants throughout the town at a cost exceeding £6,000. A new fire engine station and depot, and the reconstruction of several roads has also been approved by the council.

Sheffield (Mr. C. F. WIKE, M.INST.C.E., city engineer).—In addition to the usual routine work of the department, including sewage treatment, a scheme for the secondary treatment of sewage, at an estimated cost of £70,000, is to be taken in hand during the year. Several important street-widening schemes are to be taken in hand, at an estimated cost of £100,000 together, with a number of smaller improvements, powers for which were included in the Sheffield Corporation Acts, 1912 and 1914. A scheme (estimated to cost upwards of £250,000) is also in hand for the widening of two important thoroughfares, and providing a large open square at the very busy junction of the streets. With two exceptions the whole of the properties to be demolished have been acquired by the corporation. A portion of the river Sheaf is to be covered over in connection with the scheme, at an approximate cost of £10,000. A considerable amount of work is in progress in connection with town planning, and will be proceeded with during the year. The total area of town planning schemes at present in hand in Sheffield is about 6,000 acres. The widening of two bridges over a railway and canal, at an approximate cost of £15,000, and the widening of two bridges over the river Don, at an estimated cost of £14,000, will probably be taken in hand during the coming year. Public conveniences are to be erected in various parts of the city, at an estimated cost of £3,500. In addition to the ordinary work in connection with parks and recreation grounds, the construction of several bowling greens is contemplated, together with pavilions and conveniences, at a total estimated cost of £2,000. Sanction has been received from the Local Government Board for laying out a cemetery at a cost of about £6,000: the work is in progress, and will be proceeded with during the year. A plot of land has been purchased, at a cost of about £3,800, for the purpose of providing allotment gardens in the eastern portion of the city, and it is probable that the greater portion of the land will be laid out during the forthcoming year.

Sheffield (Mr. W. J. HADFIELD, city surveyor).—During the year a further reorganisation of the corporation departments has taken place, with the result that Mr. W. J. Hadfield has been appointed city surveyor, and the scope of his department has been enlarged. For the general maintenance and upkeep of the 340 miles of adopted streets in the city during the year a sum of about £50,000 will be required, in addition to which £30,000 is to be spent on private street works. Considerable progress has been made with the scheme for road construction amounting to £40,000, towards which the Road Board made a grant of £17,000. About half the amount has now been spent. Probably from £15,000 to £20,000 will be spent during the year upon sewerage works. An extension of the Ecclesall tramway route is to be taken in hand, which, together with the repairs and renewals, will account for an expenditure of probably £45,000 upon tramway work. There are a number of smaller works on hand, which, together with street cleansing, estimated to cost £31,000, will probably bring up the total expenditure of the department for the year to about £240,000. This is a considerably less total than that estimated for the previous year, but the fact that work has been promised on their return to about 250 men belonging to the department who are now with various branches of His Majesty's Forces, has caused the cutting down of expenditure for the present, the object being to save as much work as possible for these men when they return, rather than create works solely for the purpose of keeping them employed.

Sheringham (Mr. F. HALL SMITH, M.I.M. AND CO.E., P.A.S.I., M.R.SAN.I., engineer and surveyor to the urban district council).—Sanction has been received from the Local Government Board for a loan of £900 for surface-water drainage, and this work will no doubt be carried out. Owing to the war, the council will not be carrying out extra work. At the present time the depot and storeyard are being enlarged.

Shrewsbury (Mr. A. W. WARD, ASSOC.M.INST.C.E., borough surveyor).—Several roads in the borough will be strengthened in the foundations and remade; a tender has been accepted for sewering a growing suburb, and the work will be shortly put in hand. Preliminary work is in progress with a view to the preparation of a town planning scheme, and a further housing scheme is under consideration. A tender has been provisionally accepted for the installation of a filtration and aëration plant at the public baths. Private street improvement works are also in hand.

Skegness (Mr. R. H. JENKINS, engineer and surveyor to the urban district council).—Several private streets will be made up during 1915, and the widening and improvement of Wainfleet-road continued. A committee has just been appointed to report as to the advisability of applying for permission to prepare a town planning scheme for portions of the town. The following works are also under consideration—viz., improvement of parades, screening apparatus and an compressor at sewage pumping station, alterations at the sewage farm, and several water main and sewer extensions. A Bill is being promoted in Parliament this next Session for the acquisition of the gasworks, following the council's successful opposition to the company's Bill during the 1914 Session.

Skipton (Mr. ARTHUR E. W. ALDRIDGE, surveyor and waterworks engineer to the urban district council).—Extensions at the sewage disposal works are to be carried out, consisting of additional tanks, filters, humus tanks, sludge lagoons, and pumping-house. The deviation of the Keighley and Kendal main road for a distance of 600 yds. is to be put in hand, and main road widening and bridge reconstruction in the south of the town.

Somerset (Mr. EDWARD STEAD, ASSOC. M.INST.C.E., county surveyor).—The strengthening, draining and laying of improved surfacing materials will be continued on some of the more important main roads with the aid of grants from the Road Board. It is probable that extensive improvements by widenings and deviations will be taken in hand on the Taunton to Minehead and the Bridgwater to Minehead main roads. A large extension of surface tarring is contemplated, an aggregate length of about 160 miles being proposed for treatment. A tar-macadam plant will be installed in the division under the direct control of the county council, and careful trials are to be made of tarred limestone macadam. The usual expenditure of about £4,000 will be incurred in rebuilding and strengthening bridges. Six cottages for roadmen are to be erected for the county council's men, together with a central depot for the Long Ashton division.

Southam (Mr. HERBERT PICKERING, surveyor and inspector to the rural district council).—In addition to the maintenance of existing works and smaller improvements, a scheme is being prepared by Messrs. Taylor & Wallin, engineers, Newcastle-on-Tyne, for supplying the town of Southam with water obtained from a new well sunk in the Holy Well field. This supply was found after a number of experiments carried out under the instructions of a Special Committee, and the final result exceeded all expectations, a yield of 108,000 gallons per twenty-four hours being obtained. Only 30,000 gallons per twenty-four hours is required for Southam. The estimated cost is approximately £4,000 and it is hoped the work will be commenced during the ensuing year.

Southampton (Mr. J. A. CROWTHER, borough engineer and surveyor, and architect to the Education Committee).—Private Street Works Plans are not made [illegible] being prepared for a portion of private streets. Contracts are in hand for two streets. Schools: Tenders have been received for the construction of an elementary school for 1,200 scholars. This work will commence at once. The council have under consideration the building of another elementary school for 1,250 scholars, which will no doubt be proceeded with during the year. Asphalt and Tar-macadamising: A large area of carriageway was treated during 1914. An application for an extension to borrow £32,000 for this class of work is now before the Local Government Board. Disposal Works: Work is proceeding with the reconstruction of a ferro-concrete quay wall at the principal depot on the river, in substitution of old wooden piling and sheeting. The council have under consideration schemes for modernising the disposal of the sewage of one of the suburban districts of the borough. Refuse Destructors: A refuse destructor plant, consisting of six cells, two boilers, and chimney shaft, is being laid down at one of the depots. Hospitals: Plans for a tuberculosis hospital are now before the Local Government Board. This will be proceeded with as soon as sanction has been received. Thirty-six acres of land have been purchased for hospital purposes. A tuberculosis dispensary and [illegible] in full working order, and supplies a long-felt want. A scheme has been prepared for doubling the laundry accommodation at the isolation hospital. Sewers: The [illegible] carried out during the year. Flood prevention works are in progress in one of the low-lying districts of the borough (comprising 80 acres of fully built-upon land) which is occasionally flooded with tide water. The greater portion of the land is very little above the level of high water ordinary spring tides. Housing: Application is before the Local Government Board for sanction to purchase 36 acres of land for housing purposes, and the council are about to invite tenders for the erection of fifty houses. Baths: Designs have been prepared and are now before the council, for the erection of slipper baths in one of the suburbs, with the usual offices and residents' quarters.

Southend-on-Sea (Mr. ERNEST J ELFORD, M.INST.C.E., borough engineer and surveyor).—The works to be carried out during the year include the resurfacing with bituminous material and partial reconstruction of 5¾ miles of main road, at a total cost of £21,800; the erection of electricity sub-stations in the Leigh and Thorpe Bay areas (£8,900); retort and retort-house extensions at Leigh gasworks (£3,340); reconstruction of a large refreshment room on the recently completed portion of the pier head (£2,000); shelters on the esplanades (£3,650); reinforced-concrete shelter on the cliffs (£3,500); public conveniences and lavatories on the pier head (£850); and two underground conveniences in Leigh and Westcliff (£1,960). Surface-water sewerage in the East, Central and Leigh areas, costing £12,300, will be commenced. A cast-iron rising main for the supply of well water from the site of the sewage disposal works to the electricity works will be laid early in the year (£2,750). Road improvement and tramway track doubling in Leigh Broadway (£10,500) will be carried out early in the year. Private street works will proceed as usual, and the expenditure for this purpose will probably be about £35,000. Considerable lengths of highways will be resurfaced with tar-macadam or bituminous materials. A commencement will probably be made with the construction of a new highways depot, including stables, motor sheds, workshops, and stores. Other works in contemplation include a tuberculosis hospital and the erection of twenty-four dwellings for the working classes.

Sowerby (Mr. JOHN SMITH, surveyor and inspector to the urban district council).—The construction of 9-in. and 6-in. earthenware sewers, and about 1,000 lin. yds. of branch drains, has been put in hand, the estimated cost of the work being £4,300. Other extensions to sewers are contemplated. A public water supply is under discussion, but nothing definite has been arrived at. Halifax Corporation are seeking powers to extend their tramways still further through the district. Other works contemplated, but not yet decided upon, are the laying of tar-macadam and surface tarring, and improvements to the footpath on the main road, putting up a further section of setts and laying macadam; road widening at Sowerby Green, and improvements to roads generally throughout the whole district.

Southport (Mr. A. E. JACKSON, ASSOC.M.INST.C.E., borough engineer and surveyor).—The works for the sewerage of Ainsdale and Birkdale are in course of construction. The corporation have in hand a scheme for laying out, as public parks and gardens, an area of 60 acres on the foreshore, and also a further section of the new gardens in Lord-street. The council have accepted plans for a new technical school, and have before them schemes for the remodelling of the municipal buildings and the construction of a new market on the Market Hall site. They are also proceeding with a scheme for the town planning of the whole of the borough.

South Shields (Mr. LESLIE ROSEVEARE, M.INST.C.E., borough engineer and surveyor).—In addition to the usual routine work, the following schemes are in course of preparation or in hand: 190-bed fever and tuberculosis hospital; public mortuary; tuberculosis clinic; town planning scheme of 2,500 acres; borough extension; a 5-acre extension of the Marine Parks; completion of the additions to the electricity station; road and sewer diversions necessitated by the construction of a new 650-ft. dock; and diversion of three main roads out of the town, including a new bridge and tramway extensions. A Parliamentary Bill is being promoted in the coming Session for quay extension, road improvements, and further tramway extensions.

Southwold (Mr. JAMES S. HURST, M.I.M.S.P.E., borough surveyor).—Schemes in hand or contemplated for 1915 include a concrete sea defence, with undercliff promenade extending from a point in front of the Sailors' Reading-room to the south of the cliff known as Gun Hill; a concrete footpath to be constructed 3 ft. 6 in. wide on top of the mud wall, extending from the foot of Gun Hill to the lifeboat house. A footbridge over the Buss Creek will connect up two outlying parts of the district, and be of much service to the inhabitants. A roadway 30 ft. wide from the Promenade Pier to the Buss Creek is projected. The council also have in hand a scheme for laying out a portion of the Common as building land, but this is at present held up on account of the war. A storm overflow from the main sewer in Station-road is being considered, the present sewer not being large enough in heavy storms to take away water conveyed to it. During the past year the council have carried out a good deal of tar-dressing of roads, and this work will again be continued on a larger scale in the spring. The North Parade has been reconstructed. A new groyne has been erected on the beach, and a number of small improvements have been carried out. The sewage works, which had been a source of trouble for some time, have been entirely remodelled and reconstructed, and the council's housing scheme has been completed. Sir Ernest Clarke officiated at the formal "opening" of the houses in June last, and the introduction of the new steam fire engine, on the same date.

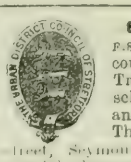
Stafford (Mr. WM. PLANT, ASSOC.M.INST.C.E., borough engineer and surveyor).—The remodelling of the borough hall, which is well in hand, will be completed. The reconstruction of the police station, including new cell accommodation, will be proceeded with. A scheme for the purification of the whole of the town sewage on bacteriological lines is in course of preparation, and will be commenced during the year. The new road across

the valley of the river Sow, nearly ½ mile in length, and raised from 6 ft. to 8 ft. above the surrounding land, will be finished in the Spring. A scheme is now before the Local Government Board for the extension of the boundaries of the borough from 1,084 acres to about 3,700 acres, and a local inquiry will be held at an early date. The laying out of the two corporation building estates will be proceeded with, and various street improvements are contemplated.

Stoke-on-Trent (Mr. A. Burton, Assoc.M.Inst.C.E., F.S.I., borough surveyor).—The ordinary maintenance of the 130 miles of roads in the borough will entail a large amount of expenditure due to the rapidly increasing heavy through motor traffic. A loan has been taken up, amounting to £10,100, for paving the main road between Hanley and Burslem with setts on concrete, this being the second portion of a considerable programme which has been laid down for paving the majority of the main roads in the borough. The widening of High-lane, which is a main road leading in the direction of Manchester, to a width of 50 ft., for that portion of its length which is within the borough boundary, is well in hand, and the widening of Stone-road and the bridge over the river Trent will also be put in hand. The active programme under the Private Street Works Act, 1892, will be continued. The two town planning schemes—one in the Burslem area and the other in Stoke area—will be proceeded with during the year. The laying out of a new park at Fenton has been commenced, and instructions have been issued for the preparation of plans and designs for a recreation ground at Goldenhill. The construction of the Burslem storm-water drainage scheme, which is being carried out departmentally at a cost of, approximately, £11,000, is well on towards completion, and further subsidiary sewers in connection with this scheme will be put in hand. An extensive storm-water scheme will receive attention for the surface-water drainage and storm relief to the existing sewers in Hanley, which is estimated to cost the sum of £16,000. Building operations in connection with the proposed alterations and additions at Stanfield Hospital, adapting this building for sanatorium purposes, are now being carried out, and the provision of tuberculosis branch dispensaries at Burslem and Longton is being considered. A new police station is being erected at Fenton, and arrangements are being made for alterations and additions at the Burslem Station. A new public convenience is in course of erection at Hanley. Alterations are to be made at the Butchers' Market, Burslem, for district finance offices. The re-roofing and alterations required for the adaptation of the old town hall, Burslem, for the purpose of a public library and district municipal offices is to be dealt with shortly. Arrangements are being made for the erection of a new fire station at Hanley, and a refuse destructor works at Tunstall. The provision of cold storage at Hanley abattoirs is under consideration, also the erection of a pavilion at Longton Park. Other proposed works include the erection of mortuaries for the Hanley and Stoke districts respectively, the erection of an additional block at the Fenton library to form juveniles' reading-rooms, the reconstruction of the roof of the Hanley Museum, and the formation of a new town yard and depot for the Stoke district.

Stratton and Bude (Mr. Francis J. Worden, surveyor and waterworks engineer to the urban district council).—The council have under consideration proposals for laying a new water main from Stratton to Bude, a distance of about 1 mile along a route which is likely to be developed for building purposes. The estimated cost, including valves, meters and hydrants, is about £900. Among other proposals are included extensions of sewers in the outlying parts of the district, and the possible development of a separate scheme at Upton Cliff. Works in connection with the making up of private streets will be carried out, and several street and other improvements are proposed.

Suffolk, East (Mr. Henry Miller, M.Inst.C.E., civil engineer and county surveyor).—There is nothing of special interest in progress this year. The only matter of importance is the erection of single cottages for police constables in country villages, where suitable ones are unobtainable.



Stretford (Mr. Ernest Worrall, F.S.I., surveyor to the urban district council).—A new elementary school in Trafford Park to accommodate 800 scholars is approaching completion, and will be opened early in the year. The widening of Edge-lane, King-street, Seymour-grove, and Upper Chorlton-road arterial thoroughfares communicating with adjoining districts is proceeding as frontages are acquired. A scheme for reinforced concrete settling tanks of 1,000,000 gallons capacity, and an electric pumping set at the sewage farm together with the acquisition of 45 acres of additional land, has been submitted to the Local Government Board, whose inquiry is shortly to be held, after which the work will then proceed. The usual batch of private street works scheduled for completion is held in abeyance pending the termination of the war. An artesian well has been sunk in Longford Park, and a compressed-air plant to lift the water supply therefrom to an elevated tank is to be installed. The erection of a new reinforced concrete and masonry bridge and approaches, 51 ft. wide between parapets, over the Bridgewater Canal from the Chester (main) road into Trafford Park is contemplated. It is proposed to complete the scheme under Part III. of the Housing of the Working Classes Act by the erection of fifty additional cottages in semi-detached pairs on the acquired site. The lighting of the main thoroughfares by electricity is to be improved. Smaller items of improvement and growing maintenance will add to a busy year's work.

Suffolk, West (Mr. W. Lionel Jenkins, Assoc.M.Inst.C.E., F.A.S.I., county surveyor).—The improvement and reconstruction of the main roads are being rapidly proceeded with, with the assistance of the Road Board. The Newmarket-Bury-Stowmarket road is complete, except for a small section near Kentford. The greater part of the Bury to Sudbury road is complete, as is also the Ixworth to Thurston road. Both the Stour Valley and Newmarket to Thetford roads are being dealt with, and long lengths of these roads have already been remade. Some 30 miles of roads in all have been reconstructed, with the help of the Road Board, within the last fifteen months. Modern methods of road making are being introduced, and the road labourers are being steadily trained by the county surveyor's department into skilled workmen. In addition to ordinary water-bound surfaces, certain lengths of road have received surface coats of tar-macadam, pitch-grouted macadam, and Reconstructed macadam. It is proposed to extend the area under surface treatment by tar in the coming season. A number of road widenings are being carried out on the Newmarket to Thetford road, and Thurston to Ixworth road. Kentford Bridge will probably be reconstructed during the summer. Eldo-road will be improved, with the assistance of the Road Board, and taken over as a county road. Extensive works of surface drainage are being carried out in Mildenhall and Brandon. West Suffolk roads are suffering severely by the extraordinary military traffic, and schemes are being prepared to provide for contemplated increase in the same.

Sunderland (Mr. J. W. Moncur, M.Inst.C.E., F.I.S.E., borough engineer and surveyor).—A new bow-string girder bridge is contemplated across the river Wear to supersede the old iron bridge built in 1796 and reconstructed in 1859. The new bridge will consist of three main girders. One girder will form the centre of the bridge, and will divide the north and south going traffic. The total width of the bridge will be 90 ft. 8 in. between the parapets, and it will have overhanging gangways on each side to carry water and gas mains. The plans have been lodged for this Session in Parliament, and it is expected the scheme will take three years to complete. Plans have also been prepared for large extensions to the town hall, but, owing to the war, nothing further has been done. Extensive additions are to be built at the borough sanatorium—viz., administrative block (twelve bedrooms), tuberculosis block (twenty-four patients), isolation ward, and the remodelling of the laundry. Sites have also been obtained for a day training college, with male and female hostels, also for a collegiate school for boys. Plans for these were approved by the council some time ago, and the

buildings will be commenced very shortly. The accommodation in the former is for 150 students, and in the latter 400 boys. Preliminary plans have also been prepared for open-air salt-water bath, and the continuation of the promenade at Rocket

Surbiton (Mr. HENRY T. MATHER, engineer and surveyor to the urban district council).—Progress will be made in the construction of a new cemetery, together with chapel, lodge, and sanitary block. The council having received [illegible] from the Local Government Board permission to prepare a town planning scheme for a portion of the district; it is hoped considerable progress will be made in the preparation of such a scheme. Certain street widenings and improvements and rounding-off of dangerous corners will be carried out.

Sutton Coldfield (Mr. W. A. H. CLARRY, ASSOC.M.INST.C.E., borough engineer and surveyor).—A number of works are being pressed forward to meet any demand that may be necessary for the relief of distress during the winter or the continuance of the war. At present the building of a refuse destructor in connection with the electricity supply station is well in hand, and the erection of a girls' cookery and laundry school, two boys' manual schools, and latrines in the park are being commenced. These, with the labour required for erecting the huts and headquarters to form two complete camps for the Birmingham City Battalions, who are now drilling in Sutton Park, will provide sufficient work for the district for some time. The further works that are in readiness are the widening, strengthening and surfacing of Tamworth-road for over a mile, the widening of Coles-lane, which includes the spreading of the surplus soil over the refuse-tip to provide allotments, and the dredging of one of the bathing pools in the park. These will be proceeded with immediately any distress occurs. Plans are also being prepared for new open-air swimming baths, and works of widening.

Sutton-in-Ashfield (Mr. WALTER BURN, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—The 33-in. concrete tube sewer has been put in, but is not being utilised till the sewage disposal works have been enlarged, which it is proposed to do at a cost of £20,000. There are now twelve streets in course of construction under the Private Street Works Act, 1892. It is expected the new post office will be erected during the coming summer, as well as a caretaker's house at the small-pox hospital. There are two or three road widenings and improvements contemplated; also a new sewer in Skegby-road, to take drainage from new works; but their being put in hand will depend a good deal on whether the war lasts. It is intended to fence the three recreation grounds recently given by the Duke of Portland to commemorate his silver wedding, and the coming of age of his son the Marquis of Titchfield. It is proposed to make extended use of tar-macadam and tar-spraying.

Swaffham (Mr. L. KEYWORTH BERRIDGE, surveyor to the urban district council).—In addition to the usual routine work, the council are taking up a loan for the laying out of a new cemetery. The housing question will also receive consideration.

Swindon (Mr. H. J. HAMP, ASSOC.M.INST.C.E., borough surveyor).—The new engineering laboratories at the technical schools, costing £4,500, are nearing completion, and will shortly be opened. The question of extending the town hall buildings is under consideration. The drainage of the farms at the waterworks, and new system of filtration for the town supply, will be considered by the council early in the year. New trunk water mains are to be laid in the borough, at an estimated cost of £2,300. Under the Swindon Corporation (Wilts and Berks Canal Abandonment) Act, 1914, the council have acquired that portion of the canal which is within the borough, a length of 3¼ miles, and the question of dealing with this section and the bridges which span it, also the provision of dams and gauges for supplying the canal outside the borough with water, will be considered during the year. A scheme for widening and improving the Wroughton-road from 24 ft. to 46 ft., at an estimated cost of £6,000, has been passed by the council, and the work will be put in hand forthwith. A further scheme for widening and improving the Stratton-road from 25 ft. to 46 ft. is being considered by the Works and Streets Committee. The work of making up of several private back roads will also be proceeded with.

Swinton and Pendlebury (Mr. HENRY ENTWISLE, engineer and surveyor to the urban district council).—The sanction of the Local Government Board has been obtained to the reconstruction of the sewerage system for a portion of the district, at an estimated cost of £10,857. A Local Government Board inquiry has been held into the application for sanction to borrow £8,245 for the erection of forty semi-detached cottages under the Housing Acts. In addition to the completion of private street works amounting to £7,560, further streets are to be completed at an estimated cost of £2,326. The widening of Deansroad, which necessitates the construction of a reinforced concrete wall across a reservoir, is being proceeded with.

Taunton (Mr. DAVID EDWARDS, ASSOC.M.INST.C.E., borough engineer and surveyor).—During the year the council propose commencing the work of the erection of new public baths at a cost of £3,500, and twelve additional workmen's cottages, for which application for a loan has been made. The construction of an overflow weir, 200 ft. long, over the river Tone, is in hand, and will be completed early in the year, the contractors being the British Steel Piling Company. A new house for the manager at the sewage works is also in hand, at a cost of £500. Last year a section of the main road in the centre of the town was laid with Roadamant, and it is expected that an additional length will be laid during this year.

Tenby (Mr. B. MORLEY, M.R.SAN.I., borough surveyor). — A housing scheme is in preparation for the erection of fourteen working-class dwellings, with new road and boundaries. There will be a further extension of about 700 yds. of water mains, and extensive repairs will also be carried out to the Royal Victoria Pier, including the replacement of the whole of the lower landing-stage. The work of reconstructing and extending the western sewerage outfall is in hand, and will probably be completed in 1915.

Tilbury (Mr. S. A. HILL-WILLIS, ASSOC.M.INST.C.E.I., M.R.SAN.I., engineer and surveyor to the urban district council).—The following work of improvement will be continued with the aid of Road Board grants—viz.: Strengthening foundations and surfacing with granite some 2 miles of district roads, estimated cost £3,440; and widening carriageway with hardcore foundation, improvement of gradient, and surface with granite ½ mile War Department road in South Ward. The whole cost of this latter section is to be defrayed by the Road Board. The haulage of materials for roadwork is carried out by the urban council by means of petrol lorries and steam tractors. One tractor with two trailers, by Aveling & Porter, purchased last year, has easily earned its share of loan repayment. Further sections of private street improvement works will be carried out, together with a further length of Tarmac and a trial length of other surfacing material. The works will also include ragstone tar-paving of paths, 2,000 super yds. The Local Government Board's sanction has been received, and the land having been purchased the following undertakings will be put in hand during the first week of February—viz.: Additional allotments (40 acres); public walks and pleasure grounds; new depot; and 150 cottages and roads and sewers in connection therewith. The loans for this part of the work, totalling over £56,000, have been successfully negotiated at 4 per cent. The new surface-water drainage scheme at World's End, with automatic sluice and outfall (estimated cost £28,400) will be probably put in hand, in order that no flooding may occur in the new housing areas.

Tipperary (Mr. E. A. HACKETT, M.INST.C.E., county surveyor).—The total mileage of roads repaired by the council is 1,500 miles. Practically no new roads are made or in contemplation. About 48 miles of main roads are steam rolled annually by sheeting all over travelling way 3 in. thick and consolidating. A variety of small works are carried out—viz.: Footpaths, culverts, drains, and occasionally small bridges. The work for the ensuing year will be of the same type.

Tiverton (Mr. J. SIDDALLS, borough surveyor). The council having, for the past twenty years, been engaged in carrying out improvements in all departments of municipal work—viz., purchase of and remodelling the gas works, installation of the most modern equipment of sewage disposal works, additional water supply works, concrete reservoirs, new schools, and street widening, the housing scheme, including eighteen working-class dwellings being the last to be completed, there remains comparatively little to be done of urgent importance, and the fact that 40 per cent of the council's employees in the streets and highways department have volunteered for service will naturally tend to a slowing down for a time of municipal activities. The council, however, are not standing still. The work of inspection and improvement of the housing conditions is steadily progressing. A new scheme for water supply to the village of Bolham is about to be commenced, and the question of refuse disposal and the purchase of a light traction engine are under consideration.

Todmorden (Mr. J. A. HEAP, borough surveyor and waterworks engineer). In addition to the ordinary routine work, the following works will be carried out during 1914-15 viz., storm-water tanks at sewage disposal works; public and private street improvements; sewerage works; coating main roads with tar-macadam; bowling greens and tennis courts at Centre Vale Park; hockey fields and tennis courts at secondary school.

Tring (Mr. S. S. GETTINGS, Assoc.M.Inst.C.E., surveyor to the urban district council).—The council have received the sanction of the Local Government Board for a loan of £1,000 for kerbing, channelling and tar-paving footpaths for parts of Wingrave-road, Grove-road, Station-road and Park-road, and also for £340 for relaying foul-water sewer in the New Mill district. These works will probably be put in hand early in the year. The council are spending about £100 annually on tar-painting roadways with refined tar, the work being executed departmentally. A new sewer in Bunstrux-hill has been laid during the past year to drain a further twelve dwelling-houses which have been erected for letting to the working classes. The council now possess fifty-six houses of this class, which are used entirely for letting to tenants of houses which are considered unfit for habitation. A considerable amount of work has been put on to the surveyor's department owing to the close proximity of the camp of the 21st Division at Halton Park, and the billeting of about 3,000 troops in the town. Temporary baths have been fitted into an existing building, including twenty-four galvanised-iron slipper baths, which are supplied with hot and cold water. The council have given the War Office permission to erect two additional pavilions at the isolation hospital, which, it is expected, will be put in hand shortly. A large amount of disinfection of clothing has been done for the military authorities. Owing to the War Office taking all the schools in the town for hospitals for ordinary illnesses, several public buildings have had to be altered so as to adapt them for the use of temporary schools, and sanitary accommodation erected.

Ulverston (Mr. C. TELFORD HAGUE, surveyor to the urban district council).—The widening and improvement of Priory-road, contemplated last year, is now in hand, and will be completed early in the present year. A loan of £5,612 for works of sewerage and sewage disposal has been granted. The widening and improvement of several principal roads are under consideration, and a further extension of tar-macadam and tar-spraying is contemplated. A number of private streets are scheduled for making up under the Private Street Works Act.

Ventnor, Isle of Wight (Mr. H. H. OAKE, surveyor to the urban district council). A great deal depends on the progress of the war as to what municipal works are carried out in Ventnor during 1915. For many years past practically 50 per cent of the visitors to this town were Germans; in fact, it was no uncommon thing to find during the summer months the chief hotels in the town with fifty or sixty visitors in each, and hardly an Englishman among them. For this reason Ventnor has been more severely hit by the war than any other seaside town on the whole coast. On the outbreak of war in August last, the town of Ventnor responded most nobly to the call "For King and Country," nearly every eligible man joining the colours. Several contracts were about to be let, but these were immediately cancelled. It is almost too much to hope that the war will be finished in time to allow the country to resume normal conditions before the end of next summer, in which case it is not anticipated that anything but ordinary routine work will be proceeded with. The cemetery extension, which has now been in hand for some years, will no doubt be completed, and possibly some of the underground conveniences which were under consideration will be constructed.

Wadebridge (Mr. ROBERT W. BURR, surveyor to the urban district council).—The council intend completing the raising and widening of the Egloshayle-road, and constructing a promenade along the bank of the river. It is proposed to lay out bowling greens in the public park. Various street improvements have been carried out, and others are projected. It is also intended to make extended use of tar-macadam and tar-spraying, for which the council are about to purchase the necessary plant. The public convenience at the Bridge End is completed.

Wakefield (Mr. J. P. WAKEFORD, M.INST.C.E., city engineer and surveyor). — County borough powers come into operation on April 1st, and it is anticipated that the following works in progress or projected will be completed during the financial year 1915-16. The drainage scheme for the western half of Sandal (£18,000), the chief for the coupling up of the existing sewage work at Agbrigg to the main sewage outfall works at Calder Vale; and a scheme for the remodelling of the sewers in the Agbrigg and Belle Vue districts (£4,800). Oxidation experiments for the purification of sewage have been in progress for the last four months, with most satisfactory results. Some time, however, must necessarily elapse before arriving at the best method of working the process. A scheme for extensions and additions to the infectious diseases hospital, including an addition of twenty-four beds, new laundry block, discharge block and lodge, and additions to the administrative block (£14,000), has been submitted to and approved of by the Local Government Board. The question of a tuberculosis sanatorium is being considered. The repaving of several streets with granite setts, for which a loan of £14,000 was sanctioned by the Local Government Board, is proceeding steadily. The widening and improvement of various roads and streets is at present in hand, or will be undertaken during the year—viz.: Castle-road, sewering and part widening (£2,300). Sugar-mine, sewering and widening to 40 ft. (£4,400), and the improvement at the junction of Denby Dale-road and Bigg-road (£150). The relaying of part of the Denby Dale-road sewer (£1,200) has been completed, and the resewering of Vicarage-street (£2,450), and the relaying of a portion of the main sewer at Belle Isle (£1,200), will be undertaken in the early spring. The scheme for the demolition of an insanitary area in Westgate, known as Spawforth and Tidswells yards, and the construction of a new street 40 ft. wide between Back-lane and Westgate, will in all probability be carried out. Private street works have been completed in the past year to the value of £1,500. Public conveniences are being provided at important points within the city, one for gentlemen having been already completed, and one for ladies and gentlemen will shortly be ready for use. Extensions are being carried out at the Cattle Market

(£800), and a scheme has been prepared for the covering in of part of the public market and the provision of market sheds and stores (£2,800). The building by-laws have been revised and are at present in the hands of the Local Government Board. Plans have been approved, and the loan sanctioned by the Local Government Board, for 108 houses for the working classes at Alvechurch and Bells Yew (£18,000), the work being temporarily held up by reason of the recent advances in the price of materials. The Works Committee have adopted the suggestion of the city engineer to abandon the use of water-cooled manholes, and to substitute ventilators in the covering of all their sanitary pressure sewers with watertight joints.

Wallingford (Mr. WM. HENEY-BONE, borough and building surveyor).—Various private street works are contemplated, also surface draining, while main roads and other roads will be re-surfaced. The council also contemplate having some Tarmac and artificial stone flag footways laid. The completion of a fencing job for twelve workmen's dwellings is to be carried on with as a new lodge and entrance gates and fencing to the walks of a Horse park, recently presented to the borough.

Wantage (Mr. JOHN W. HARRIS, M.I.M. AND C.E., engineer and surveyor to the rural district council). In addition to ordinary routine work the erection of six workmen's dwellings, together with the erection of fencing, extension of sewers and construction of house drains in the village of Letcombe Regis will be completed during the year. A water supply scheme for the village of Letcombe Regis is now being prepared, and will shortly be submitted to the Local Government Board with a view to sanction of a loan for carrying out the work. The council have under consideration schemes for the extension of sewerage and sewage disposal works in the parishes of Ardington and East Lockinge, at a cost of £1,200.

Ware (Mr. FOX HILL, surveyor to the urban district council). Beyond the usual works, nothing of much importance is projected. A scheme for the proposed widening of Star-street is under consideration, and will be carried out during the coming year, and a scheme for the improvement of the water supply, in the shape of an increased pressure in the mains that supply the higher parts of the district, is still under consideration.

Warrington (Mr. A. M. KER ASSOC.M.INST.C.E., borough engineer and surveyor). Powers have already been obtained for widening Butter-market-street from 22 ft. to 60 ft., and this widening will be proceeded with as the new buildings are finished and the old ones demolished. The second quadrant of the Market Gate-circus will then be completed. Street works, at a cost of £7,500, will be carried out. Application will be made to the Local Government Board for sanction to borrow about £12,000 for private street works. The small-pox hospital is to be permanently appropriated for a sanatorium, and extended at a cost of £5,000, and a new small-pox hospital erected on another site. The completion of the rearrangement of the stalls in the fish market is to be proceeded with, and an underground lavatory is to be placed beneath the market. Application is being made to Parliament for the widening of a portion of Sankey-street, and negotiations are proceeding for the acquisition of the necessary property. Tramway shelters are to be provided at the termini of the various routes. A further extension of slipper baths at the public baths is contemplated, as well as the provision of a swimming bath at the Evelyn-street council school. Warrington Bridge is now nearing completion, and the works of paving the bridge and widening of the streets converging upon it are in hand, and will, it is expected, be completed early in the year.

Wath-upon-Dearne (Mr. J. H. DREW, M.I.M. AND CO.E., M.R.SAN.I., engineer and surveyor and waterworks engineer to the urban district council).—The new waterworks extensions, which have recently been completed at a cost of £12,000, were opened on January 1, 1915. The extensions and remodelling of the sewage disposal works is proceeding, and a contract has been entered into. When completed the cost will approximate to £14,000. Land has been purchased for several important road widening schemes, and these will be carried into effect at a cost of several thousand pounds. A number of streets will be made up under the provisions of the Private Street Works Act, 1892. A housing scheme has been under consideration, and plans have been placed before the council for the erection of 252 workmen's dwellings, but, owing to the war and prices of building materials, the scheme will probably remain in abeyance for some time to come. The joint light railway scheme, promoted by the urban district councils of Wath-upon-Dearne, Bolton-upon-Dearne, Wombwell, and Thurnscoe, has been approved by the Light Railway Commissioners after an exhaustive inquiry and much opposition. The estimated cost is £151,891, and it is probable that the construction will be commenced during the year. The Wath-upon-Dearne council, in conjunction with the urban districts of Bolton-upon-Dearne and Thurnscoe, are applying to the Board of Trade for an Electric Lighting Order. The estimated cost of the scheme is £46,000. The Wath and Bolton Joint Gas Board contemplate carrying out extensive improvements and additions to their undertaking, and the cost will probably be about £30,000. Under normal conditions the year would have been an extremely busy and important one in the annals of the district, but the European crisis may somewhat limit the works which will be undertaken.

Wealdstone (Mr. HERBERT WALKER, F.C.S., engineer [illegible]). The past year has been a very busy one, the council having been constructing by direct labour an extension at their sewage outfall works for the treatment of the sewage from an adjoining area. The extension consists of a detritus and sedimentation tank with capacities of 136,000 gallons, and a storm-water tank with a capacity of 140,000 gallons. Each are provided with sludge-raising apparatus which gravitates to four sludge lagoons, 40 ft. by 12 in., these being covered over with a roof. There are six circular filter-beds, 65 ft. in diameter and 5 ft. deep, constructed on concrete floors, with aërating tiles and walls built up of coarse clinker, and graded clinker as filtering media, supplied from two automatic feed-chambers to the rotating distributors, the humus being collected into chambers, and the final effluent discharged over land and earth channels for aërating before being finally discharged into the Wealdstone Brook. The works now consist of tanks with a total capacity of 1,000,000 gallons, three 80-ft. circular filter-beds, and sixteen 65-ft. circular filter-beds. The council erected three years ago a small garbage destructor in connection with the disposal of house refuse, and this has proved of such service that another has just been completed on the same principle. The council propose to construct a concrete culvert over the Wealdstone Brook for a length of 500 yds. Plans and estimates are in course of preparation for an underground sanitary convenience. Two strong rooms are now in course of erection adjoining the council offices. As regards private street improvements, three streets have just been completed, and another street is to be put in hand. The council now have eleven grass tennis courts, two hard tennis courts have been constructed, and these have been so much appreciated that two others are contemplated. About 7 miles of roadway were tar-painted last summer, and these will be treated again this summer.

Wednesbury (Mr. E. MARTIN SCOTT, borough engineer and surveyor). — Supplementary to the ordinary routine work of the borough, several street improvements are contemplated — viz., widening and rebuilding Wednesbury bridge over the river Tame, widening the corner of Oakeswell End and Brunswick Park-road, completion of street improvements in the Shambles, abutting on the Market-place, and other minor street improvements and footway pavings. Private street improvement works will be undertaken by the corporation under the Private Street Works Act, 1892. The council have under consideration a housing scheme for the erection of suitable workmen's dwellings for

the district. The new County Metallurgical Institute has been recently opened, and is now in full swing.

West Bromwich (Mr. ALBERT D. GREATOREX, M.INST.C.E., M.S.A., borough engineer and surveyor).—Among the works projected for 1915 by the town council are the widening of Wednesbury Bridge and approaches, jointly between the Staffordshire County Council, the Wednesbury Corporation, and the council; extensions to infectious diseases hospital, and street improvements and road widenings. The housing question is under consideration, and it is probable that a number of artisans' dwellings will be erected. The Education Committee have invited tenders for the erection of two schools and a school clinic. Plans are being prepared for enlarging the sewage works at an estimated cost of £25,000. The general routine work will include the continuation of improving road surfaces with tar-macadam.

Whitley and Monkseaton (Mr. A. J. ROUSELL, ASSOC.M.INST.C.E., engineer and surveyor to the urban district council).—The following works are contemplated, and will probably be put in hand during the coming year—viz.: New sewerage scheme, public shelter and gardens on the Promenade, Rockcliffe end; construction of new road from Whitley-road to Monkseaton new station; Provisional Order for purchase of land for town hall and public offices; various street improvements; and a town planning scheme. A good deal of the negotiation in connection with the latter has been concluded. Making up of a considerable length of private streets will be proceeded with, as well as the extension of the council's housing scheme. The purchase of the links and foreshore, and the promotion of a Bill in Parliament dealing with the matter are also contemplated.

Whitstable (Mr. FRANK LAURENS, surveyor to the urban district council).—There are several important public works to be undertaken during the coming year. The council have acquired a piece of land from the Admiralty on the west side of the town for the purpose of providing a recreation ground on the sea front. A bandstand, public conveniences, and wind shelters are to be erected, and the whole of the ground enclosed with an ornamental iron fence, at a cost of about £5,000. It is also proposed to construct a bathing pool on the west beach, at a cost of about £250. At Tankerton several new streets are to be made up under the Private Street Works Act, 1892, and the sea wall is to be extended to the urban boundary during the coming year. The new station at Westmeads, on the Kent Coast main line (South Eastern and Chatham Railways), which has cost about £35,000, was opened for traffic on January 1, 1915, and will probably open up a large area for building purposes, as soon as circumstances will again permit building under normal conditions. The drainage of the cliff slopes is to be taken in hand with a view of providing work for the unemployed should such necessity arise. The drainage scheme, which cost nearly £40,000, is nearing completion.

Widnes (Mr. JOHN S. SINCLAIR, ASSOC.M.INST.C.E., borough surveyor).—Owing to the shortage of labour, in consequence of the war, several works will be delayed until the labour market returns to its normal condition. Fair progress has been made with the Deacon-road improvement scheme of widening the road and filling up the quarry; 10,030 loads have been deposited during the last eight months, and a further 4,000 load are required to bring up the road to the formation level. The tender of the Sterling Refuse Destructor Company has been accepted for a three-cell back feed destructor, including chimney 100 ft. high, tar-macadam plant, stone breaker, mortar mill, and electric lighting, at an estimated cost of £6,900, in hiding other works to be done by the corporation. A sanatorium is to be erected adjoining the isolation hospital to provide accommodation for fifteen males and thirteen females, at an estimated cost, including land, of £3,500. A public lavatory for males and females, for the market, is to be provided, at an estimated cost of £300. Other public conveniences in other parts of the town may be proceeded with. The conversion of privies into water-closets is rapidly proceeding; 1,360 were completed last year, and it is contemplated to alter about 600 privies this year. The other works contemplated are the sewering of several streets and passages in the Warrington-road district, at an estimated cost of £1,100, and private street improvement works—streets and passages—at an estimated cost of £6,000.

Wigan (Mr. A. T. GOOSEMAN, borough engineer and surveyor).—Baths.—The extensions to the baths have been commenced, and will be completed early in the year. Contracts amounting to £4,053 have been let for the scheme, which includes extending the pond, and erecting a reinforced-concrete gallery at the end of the baths, which will be stepped, and will have seating accommodation for 160 persons. New entrances, dressing-rooms and wash-baths will be provided. The slipper baths will be remodelled, and the floors and roofs reconstructed in reinforced concrete. New boilers and calorifiers will be installed. Tramways.—The laying of a double line of tramway in Wallgate in place of the single line has just been completed, and the carriageway has been reconstructed in granite setts. Application is being made to the Board of Trade for a loan for the construction of several sight loops. Parts of the existing tracks will be reconstructed. Greenhouses at Park.—New greenhouses at the park are being constructed by contract, at a cost of £458, and a new boiler and heating apparatus installed at a cost of £157. Housing.—A Local Government Board inquiry has been held for sanction to borrow £22,700 for the erection of 138 workmen's dwellings, and the streets in connection with same. This scheme will be commenced during the year. Conversions.—The conversion of 10,000 privies and pails into the water-carriage system will be proceeded with, at an estimated cost of £40,000. Sewage Disposal Scheme.—The Local Government Board have approved of the sewage disposal scheme prepared by the borough engineer, the estimated cost of which is £50,638, and it will be commenced immediately. Road Construction.—A number of roads will be reconstructed in granite setts on concrete and tar-macadam, at an estimated cost of £20,000. Private street improvement works will proceed as usual. A scheme is being prepared for the laying out and construction of a new road, 72 ft. wide, from Wigan-lane to Whelley, which includes the construction of a viaduct across the valley of the river Douglas. Sewerage.—Two large main sewers from the Poolstock and Worsley Mesnes districts, owing to mining subsidence, will have to be reconstructed. Schools.—A girls' high school, to accommodate 275 scholars, is in course of erection, at a cost of £10,690, and a new elementary school to accommodate 350 scholars is almost complete, the cost being £5,302.

Windermere (Mr. C. T. HINE, surveyor to the urban district council).—Important main road improvements (estimated to cost £1,199, half of which will be contributed by the Road Board) will be proceeded with. Three private streets are to be made up. Progress will be made with the sewerage and sewage disposal works, which will be in working order by the end of 1915. In connection with these works, plans have been prepared for the erection of a workman's cottage, which will be erected during the year. It is probable that the work of providing roads with bituminous-bound macadam surfaces will be extended. Plans have been prepared for a cart-shed and additions to a public building. These works may be carried out

Wolverhampton (Mr. GEORGE GIBLIN, M.INST.C.E., borough engineer and surveyor).—A long-felt want in Wolverhampton is one of the proposed undertakings, viz., the erection of a swimming bath for the sole use of ladies, as it is felt that the present arrangements of allotting certain days to the enjoyment of swimming at the existing baths does not meet the ever-increasing demand of those ex. The borough engineer has the

[illegible] for this purpose, and this has been granted by them. Housing accommodation for the council's firemen will be solved by the erection of ten cottages, for which the Local Government Board has been asked [illegible] for this work, and the site chosen for the erection [illegible] roads in the borough by making up and constructing a number of new streets. Plans are also being prepared for the [illegible] version of a mile of single track into double track is at present in hand, and the work will be completed [illegible]

Workington (Mr. H. B. WILLIAMS, borough and [illegible]). [illegible] public park, construction of an open-[illegible] the intake of the water supply from [illegible] construction of existing water-bound roads with tar-macadam. Private street improve-[illegible] bordering on Crummock Lake, near the intake works, will take place during the forthcoming spring and summer months. Other works of minor importance [illegible]

Worcester (Mr. T. [illegible], Assoc.M.Inst.C.E., city engineer, waterworks engineer and surveyor).—During the year 1915 the corporation proposed to [illegible] at the waterworks by the addition of two boilers and the provision of a new coaling place at a cost of about £1,000.

Worthing (Mr. FRANK [illegible], Assoc.M.Inst.C.E., borough engineer and surveyor).—The following are under consideration by this council to be carried out next year—viz.: Additional pumping station, and outfall pipe at the sewage works, at a cost of £6,000 (partly on loan); surface-water drainage, £1,200 (in hand); and the erection of cottages for working classes. A considerable number of streets will be made up under the Private Street Works Act, 1892, and important street widenings, sea defence works, extension of water mains and sewers, and other works will be put in hand.

Wrexham (Mr. J. ENGLAND, borough engineer).—The extension of the surface-water drainage, at a cost of £1,300, is to be undertaken. The erection of forty-four houses for the working classes, at a cost, including street works, of £9,200, is part of a scheme which, when completed, will comprise the erection of 122 houses, land for which has already been provisionally purchased at a cost of £1,600, the area being 9¼ acres. The laying out of the Parkau is proceeding, the bandstand and bowling greens having been opened during the summer, and at the present time four grass tennis courts are being laid down, and arrangements have been made for the construction of two "hard" courts. The tar-macadamising of several lengths of main and secondary roads is contemplated, and application is being made to the Road Board for grants towards the cost of same. The making good of several private streets will be taken in hand, in addition to those at present being completed.

Wortley (Mr. F. THURLBY, sanitary engineer and surveyor to the rural district council).—In addition to the ordinary routine work it is proposed to enlarge the sewage works at Chapeltown, Ecclesfield and Tinsley. On receiving the sanction of the Local Government Board to a loan, the sewering and construction of sewage works at Wharncliffe Side Village will be carried out. A scheme for disposal of the sewage at the hamlet of Charlton Brook, which has been approved by the council, will be carried out. Application will be made to the Local Government Board to obtain a loan to sewer Lotley. About 600 yds. of 9-in. sewer will be laid, and four streets made up under the Public Street Works Act, 1892, in Ecclesfield parish, and application will be made to the Local Government Board to adopt the Public Street Works Act, 1892, for several more streets, and for sanction to prepare a town planning scheme.

York (Mr. F. W. SPURR, city engineer).—The following works will be [illegible] Sewage disposal works, Naburn, and storm-water tanks and electrically driven pumping plant at Fulford; Glen Gardens and Playing Fields, Heworth; piling and laying out of river bank, near Lendal Bridge; electric sub-station, Lendal Bridge; reconstruction of roads (Clifton and Malton road) in tar-macadam on concrete; tramway passenger shelter, Holgate. Contracts have been let for the following, and the works will be commenced shortly—viz.: Tramway extensions, Hull-road and Haxby-road; new street, 400 yds. [illegible] works-lane; new main sewers at Heworth; new weights and measures offices, police quarters and recreation room; twenty-eight cottages for tramway employees at Fulford. Plans for the following are in preparation, and it is probable that several of the works will be put in hand during the year—viz.: Two hundred and forty-eight cottages and laying out of estate at Heworth; extensions to fever hospital; Butcher-terrace extension; footbridge, Burton Stone-lane railway crossing; reconstruction of several roads in tar-macadam on concrete; public conveniences; extensions to car sheds; several streets under the Private Street Works Act, 1892. Three large town [illegible]

Yorkshire, West Riding (Mr. F. G. CARPENTER, county surveyor).—The county council have approved of an estimated expenditure of £238,380 in respect of the maintenance and repair of the main roads in the Riding. Among the special works proposed to be taken in hand are surface-tarring on main roads (£20,000); reconstruction of Stock Bridge (£14,700); Carlton Bridge (£16,200); reconstruction of Kilnhurst Bridge (£9,575); diversion of the Keighley and Kendal main road at Clapham; reconstruction of the Tadcaster and Hob Moor main road, between York and Tadcaster; and the reconstruction of a further length of the Wakefield and Austerlands main road at Lepton.

Ystradgynlais (Mr. T. WATKINS, surveyor to the rural district council).—Brynmorgan Bridge, over the river Twrch, in ferro-concrete (Hennebique), has been commenced, and is expected to be ready for traffic about April. Ainir Bridge, over the river Tawe—a timber structure—will be rebuilt in ferro-concrete, and Deriven-road, leading up to it, will be widened and improved. It is proposed to construct a new road between Abercrave and Colbren, two important colliery centres in the district. The sewering of the district, which is a very scattered one, will take about two years to complete. It will involve an outlay of over £30,000, and is being carried out under the direction of Mr. Gerald Swayne, of Victoria-street, Westminster, the engineer for the scheme. Sixty council houses—twenty-two at Ystradgynlais, eighteen at Abercrave, and twenty at Colbren—are in course of erection, and will be ready for occupation in a few months. The council are applying for a Provisional Order to light the district, and have agreed to purchase the undertaking of the Glantawe Electric Supply Company at £17,000. The works will be enlarged when taken over by the council. It is intended to increase the water supply by turning on additional springs, in order to supply Ystradgynlais Higher [illegible]

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liberal Counties*.

HIGHWAY DEVELOPMENT IN AUSTRALIA.

NATURAL FEATURES AND EXISTING ROADS IN EAST GIPPSLAND, VICTORIA.

The Country Roads Board of Victoria, Australia, recently made a study of the conditions in Gippsland, with a view to the development of that promising area by means of road improvement and construction; and through the courtesy of Mr. W. Calder, M.INST.C.E., chairman of the board, we have been

View from Riggalls at Glenfalloch, Shire of Maffra.

able to keep our readers in touch with the work of that body with respect to this region, as well as in matters relating to their activities generally. A sketch map of South Gippsland was reproduced in

The Mitchell River, Shire of Avon.

our issue of January 2, 1914, and a similar map of East Gippsland in the issue of February 20, 1914.

The accompanying photographs, which Mr. Calder has kindly sent us, give an excellent idea of the

Gravel Road, Shire of Avon.

natural features of the country, and the nature of the problems that confront the highway engineer. No. 1 is a view from Riggalls at Glenfalloch and is suggestive of interesting road designing work, in a region of considerable promise from the farming point of view. No. 2, the Mitchell River, in the neighbouring Shire of Avon, suggests problems in bridge location and in the tracing of hillside roads. No. 3 is a stretch of gravel road between Sale and

Graded Road along Banks of McAlister River, Maffra Shire.

Stratford, not far from the coast, and No. 4 is a graded road along the banks of the McAlister River.

A gradient of 1 in 5½ is shown in No. 5, on the Bullumwall road, near Boggy Creek. To the eye of

A Gradient of 1 in 5½, Shire of Bairnsdall.

the experienced road engineer there is in this picture something suggestive of natural conditions which render primitive roads very difficult to traverse, but are favourable to the making of especially good roads when engineering skill is brought to bear on the problem.

Whaley Bridge Joint Sewerage Scheme.—During the past year the joint sewerage scheme of the Yeardsley-cum-Whaley Urban District, Chapel-en-le-Frith Rural District, Disley Rural District, and Macclesfield Rural District has been completed at a cost of nearly £26,000. The scheme drains the valleys of the Black Brook and river Goyt, the sewage being treated at disposal works situated at Furness Vale. The engineers were Messrs. Beards & Pennington, Chapel-en-le-Frith.

South London Housing Scheme. A revised scheme for the erection of dwellings on the first section of the Tabard street area, Southwark, was submitted to the London County Council on Tuesday by the Housing of the Working Classes Committee. The report stated that, owing mainly to the increase in the rates of wages and in the cost of building materials, the former scheme would have shown a capital deficit of £8,280. It was therefore considered necessary to prepare a new scheme, and the present proposal was that, upon an area smaller than was originally proposed, 120 tenements should be erected, containing 310 rooms compared with 285 rooms in the dwellings comprised in the former scheme. The estimated expenditure on capital account was £28,582. The Finance Committee reported that, with interest at 4½ per cent on this outlay, an annual deficiency of £206 was shown.

The Legal Precedents of 1914 in Relation to Municipal Engineering.

By J. E. REGISTER CONDER, a Solicitor of the Supreme Court.

Among the subjects [illegible] dealing on matters within the scope of this journal, highways [illegible] rank first in point of numbers. [illegible] a perusal [illegible] which the reports of the decisions [illegible] with the property [illegible] such as for example [illegible] accidents, [illegible] works, extraordinary traffic, dedication and repairing [illegible] mention only a few.

As usual, several cases have involved the construction or interpretation of some statute or provision. Among the Acts that [illegible] are to be found the Highway Act, 1835 (sec. 23), the Railway Clauses Consolidation Act, 1845, the Waterworks Clauses Act, 1847 (sec. 53), the Metropolis Management Act, 1862, the Public Health Act, 1875 (secs. 150 and 257), the Rivers Pollution Prevention Act, 1876, the Baths and Washhouses Acts, 1846 and 1878, the Highways and Locomotives (Amendment) Act, 1878 (sec. 20), the Electric Lighting Act, 1882, the Bankruptcy Act, 1883, the Housing of the Working Classes Act, 1890, the Private Street Works Act, 1892, the Public Authorities Protection Act, 1893, the Thames Conservancy Act, 1894, the London Building Act, 1894 (sec. 22), the Locomotives Act, 1898, the Housing and Town Planning Act, 1909, and the London County Council (Tramways and Improvements) Act, 1913.

Among the [illegible] Bacup, Barnsley, Bessels, Bradford, Bristol, Burnley, Croydon, Crouch End, Folkestone, Hadham, Knutsford, Ledbury, Linthwaite, Llangollen, Long Eaton, Newcastle-on-Tyne, South Benfleet, Tottenham, Walton-on-Thames, Wandsworth, and Worcester.

The cases comprise [illegible] decisions of the House of Lords, twelve of the Court of Appeal, seven of the Chancery Division, seven of the King's Bench Division, and one of a county court.

Ancient Lights.

A decision [illegible] important point in connection with this subject was decided in *Bailey & Son, Limited*, v. *Holborn & Frascati, Limited* (vol. xlv., p. 484). The plaintiff had for [illegible] years enjoyed good and sufficient light to two houses. In consideration of a money payment, the [illegible] agreed to erect [illegible] to the adjoining premises the effect of which would diminish that light to a certain extent. The defendants subsequently made alterations in another adjoining building, which further diminished the plaintiffs' light. On behalf of the defendants it was contended [illegible] by implication from the prior alterations, had abandoned their easement. But Mr. Justice Sargant held that there had been no such abandonment. He did not consider the case one for an injunction, and awarded the plaintiffs £50 damages.

Baths.

The question [illegible] whether a kinematograph exhibition is "healthful recreation" was raised in *Pierce and Others* v. *Stoke Council*. The Attorney-General applied for an interim injunction to restrain the corporation from permitting the Hoxton Baths to be used for kinematograph shows. But Mr. Justice Eve held that such entertainments were "healthful recreation or exercise" within the meaning of sec. 5 of the Baths and Washhouses Act, 1878, and refused the application. A further question raised was whether the incidental music was a contravention of sec. 2 of the Baths and Wash-houses Act, 1896 (which requires a licence to be obtained for music or dancing at public baths); but this point was not decided.

Building Line.

A point of considerable importance as to the building line of the Euston-road was decided in *Cadogan Estates* v. *London County Council* (vol. xlvi., p. 56). By an Act of 1756 the building line was fixed at 50 ft., notwithstanding which certain buildings were erected only 11 ft. back from the road. The Act was subsequently repealed by the Metropolis Management Act, 1862, which provided that, where the general line of building did not exceed 50 ft. from the highway, no building should be erected beyond that line without the consent of the Metropolitan Board of Works. In 1907 the council authorised the construction of buildings in the road which had been built to the 11-ft. line. In 1909 the architect of the council purported to define the general line of buildings under sec. 22 of the London Building Act, 1894, as 50 ft.; but it was held by the Court of Appeal (overriding the architect's certificate) that the council could not repudiate the line authorised by the board in 1867, and that the owners of premises fronting the road were entitled to build up to that line.

Contract.

Questions [illegible] arising point in connection with a contract for works was involved in *Porter* v. *Tottenham Urban District Council* (vol. xlv., p. 363). The council owned a piece of land adjoining a road, and the plaintiff entered into a contract to build a school on the land, and to complete it within ten months, subject to penalties. The council agreed to give the plaintiff immediate possession of the land, which could only be approached by the road. A landowner named Rowley, however (who had laid out the road), alleged that that part of it which adjoined the council's land had never been dedicated to the public, and threatened plaintiff with proceedings for an injunction in the event of his attempting to use it. The council took proceedings against Rowley, and ultimately the whole road was held to be a public highway (see *Tottenham Urban District Council* v. *Rowley, infra*). Meanwhile, however, the work on the school was suspended for nine or ten weeks. It was held that the council were not liable for the delay, inasmuch as their obligation to give possession was limited to their own acts and ability only, and did not extend to the acts of third parties.

In *[illegible] Trustee* v. *[illegible]* (vol. xlvi., p. 334) the bankrupts, a firm of builders, had contracted to do certain work for the corporation of Burnley. The contract contained a forfeiture clause and a clause appointing the engineer arbitrator in any dispute between the bankrupts and the corporation. The corporation having proceeded under the forfeiture clause, the Trustee in the bankruptcy applied in the County Court for leave to examine the engineer, under sec. 27 of the Bankruptcy Act, 1883, as to various matters connected with the contract. The County Court Judge refused the application on the ground that the engineer could not give any information that was not already in the possession of the bankrupts. The Divisional Court overruled this decision, allowed the Trustee's appeal, and made the order asked for.

Electric Supply.

In *[illegible] Electric Supply Company* v. *[illegible] Urban District Council* (vol. xlvi., p. 718) the council were authorised by a special Act to supply electricity. Up to January 1, 1912, they charged all consumers of electricity according to two scales—one for light and another for power. In September, 1911, they gave notice of their intention to increase the charges for power to those consumers who required power only, or power and partial lighting only. It was held by the Court of Appeal that the council had failed to discharge the onus of proof that this increase was justified under secs. 19 and 20 of the Electric Lighting Act, 1882, which prohibit undue preference.

Highways.

Accidents.

In the case of Mr. Justice Scrutton, in *Hurlock* v. *London Electric Railway Company and Another* (vol. xlv., p. 232) was reversed by the Court of Appeal (vol. xlv., p. 592). By an agreement between the company and the other defendant, the latter agreed to build and take a ninety-nine years' lease of a superstructure over the company's tube station at Cranbourn-street. During the progress of the work a piece of wood fell on the plaintiff's head. Mr. Justice Scrutton held that the company had a duty to safeguard the public, and could not rid themselves of that duty by delegating it to an independent contractor. But the Court

of Appeal held that the company, being merely the lessees of the building, were not liable.

In *Papworth* v. *Battersea Borough Council*, the plaintiff, while riding a bicycle, was thrown by reason of a defective gully. The council were both the highway authority and the sewer authority, and Mr. Justice Horridge held that they were liable in the latter capacity, and gave judgment for the plaintiff for £1,961, the amount awarded by the jury. The Court of Appeal ordered a new trial on the ground that the conduct of the trial was unsatisfactory.

(b) DEDICATION.

The House of Lords affirmed the decision of the Court of Appeal cited in vol. xliii., p. 830, in *Tottenham Urban District Council* v. *Rowley* (vol. xlv., p. 254). The defendant having laid out a new street in accordance with an approved plan, made it up for only half its width, but it was used in its entirety without interruption by the public from 1908. The council were the owners of land abutting on the unmade half of the street, and claimed to be entitled to access to the street from their land. For this purpose they made an opening in their fence. The defendant blocked up the opening, alleging that the unmade half of the street had never been dedicated and was private. But it was held that the whole street was a public highway, because the plan showed an intention to dedicate the whole, which intention had been completed by public user. This was the road referred to in *Parker* v. *Tottenham Urban District Council* (*supra*).

(c) EXTRAORDINARY TRAFFIC.

In *Llangollen Urban District Council* v. *Coward & Co.* (vol. xlv., p. 484) the council claimed £48 14s. 1d. for extraordinary traffic expenses. The traffic consisted in the haulage of timber by wagons weighing 30 cwt. to 35 cwt., each carrying a load of 3 or 4 tons, and was continued for a long period of time, two journeys a day being made by each wagon. The main defence was that timber-growing was a recognised industry of the district. But, while accepting this view, the learned County Court Judge held that the traffic was, nevertheless, extraordinary, the case being indistinguishable from *Geirionydd Rural District Council* v. *Green* (72 J.P., 321). A portion of the claim, however, was barred by sec. 12, subsec. (1) (b) of the Locomotives Act, 1898, and after disallowing this, and certain charges for labour, judgment was given for the council for £33 11s. 9d., with costs.

In *Ledbury Rural District Council* v. *Lady Henry Somerset* the council claimed payment of expenses incurred on account of alleged "extraordinary traffic," consisting of the haulage of stone from a quarry. The evidence showed that traction-engine traffic on the road in question had greatly increased since 1911 (the traffic prior to that date having been for the most part of an agricultural character), and that the defendant contributed rather more than half of the increased traffic. Mr. Justice Lush held that stone quarrying was a recognised industry of the locality, and that the traffic was not "extraordinary." Judgment was accordingly given for the defendant.

In *Worsborough Urban District Council* v. *Barnsley British Co-operative Society, Limited* (vol xlv., p. 958) it was held by the Court of Appeal that, in deciding whether there has been extraordinary traffic, it is not material to consider (*a*) the motive of the persons conducting the traffic, (*b*) whether there is or is not an alternative route, or (*c*) whether a road previously used has been rendered impossible to use by the action of the highway authority; but that the Court has simply to look at the phenomena as they occur on the road in question, to see the nature of the road, and to decide whether the traffic is extraordinary.

(d) REPAIR OF BRIDGES.

The decision of Mr. Justice Phillimore in *Attorney-General, at the Relation of the Worcester Corporation* v. *Stourport Near Dudley, Worcestershire, Navigation Company* (vol. xlv., p. 234) was reversed by the Court of Appeal (*Ibid.*, p. 520). The company were bound by their special Act of 1791 to keep the bridges over their canal in "sufficient repair." The Court of Appeal held that this imposed upon the company the obligation to keep the bridges in a state sufficient to bear the traffic which might reasonably be expected to pass along the highways, not (as Mr. Justice Phillimore held) according to a standard fixed once and for all, but according to a standard varying from time to time, sufficient to carry the traffic of the day. This decision establishes an "up-to-date" standard for bridges carrying highways over canals.

A similar decision was arrived at by Mr. Justice Warrington in *Attorney-General* v. *Great Northern Railway Company* (vol. xlv., p. 1,059), with respect to a bridge carrying a highway over the railway at Crouch End, which the railway company were bound to maintain under sec. 46 of the Railway Clauses Act, 1845. It was also held in this case that the company's obligation was not discharged by the Local Government Board regulations permitting them to affix a notice excluding heavy traffic from the bridge.

(e) NUISANCE.

In *Charing Cross, West End and City Electricity Supply Company* v. *London Hydraulic Power Company* (vol. xlvi., p. 56), the plaintiff company laid electric cables in certain streets under the powers of a Provisional Order, and the defendant company, acting under statutory powers, laid hydraulic mains in the same streets. Owing to subsidence of the soil, due to heavy traffic, and not to any negligence on the part of the defendant company, the mains burst, and damaged the plaintiff company's cables. It was held that the defendant company were liable, on the ground that they had for their own profit brought into the streets a dangerous thing—viz., water at high pressure—which by escaping caused a nuisance not authorised by their statutory powers.

(f) ROAD WIDENING.

In *Goodhart* v. *London County Council* (vol. xlvi., p. 204) the council, acting under the London County Council (Tramways and Improvements) Act, 1913, gave notice to the trustees of a chapel to treat with respect to part of the forecourt of the chapel, which was required for widening the road. Sec. 18 of the Act provided that the council should not be entitled to take or interfere with the main structure of any building. Owing to the gradients of the ground, the proposed widening would practically destroy access to the chapel unless extensive alterations were made thereto. It was held by Mr. Justice Joyce that the destruction of access would constitute an interference with the main structure within the meaning of the proviso, and an injunction was granted to restrain the council from entering upon the land or taking proceedings to obtain possession thereof. This decision was affirmed by the Court of Appeal (vol. xlvi., p. 625).

(g) NEW STREET.

In *London County Council* v. *Allen* (vol. xlvi., p. 625) the council gave their sanction to the laying out of a new street upon condition of the landowner entering into a covenant not to build upon a piece of land at the end of the street. He afterwards sold the land to the defendant, who had notice of the covenant. The council were not in possession of or interested in any land for the benefit of which the covenant was entered into, and on this ground it was held by the Court of Appeal that they could not prevent the defendant from building on the land.

(h) PRIVATE STREET WORKS.

Difficulties frequently arise, in connection with the making up of private streets, in determining whether a particular street is repairable by the inhabitants at large. Such questions, of course, can only occur with reference to old streets whose history may be involved in some obscurity.

There are two important decisions of the House of Lords to be noticed in which this subject was dealt with, one affirming and the other reversing the Court of Appeal.

In the latter case, *Grado* v. *Walton-on-Thames District Council* (vol. xlv., p. 403) the decision of the Court of Appeal (vol. xliii., p. 256) was affirmed. This case related to a bridle and foot way which was set out under an Inclosure Award in 1804 for the use of the occupiers of certain allotments. At some time between 1835 and 1864 the way had become a public highway for vehicles, but there had been no formal dedication under sec. 23 of the Highway Act, 1835. It was held that the road was not repairable by the inhabitants at large, and that, consequently, the council were entitled to make it up, under the Private Street Works Act, 1892, at the expense of the frontagers.

But the House reversed the decision of the Court of Appeal (noted in vol. xlv., p. 232) in *Brockman* v. *Folkestone Corporation* (vol. xlv., p. 556). This case was concerned with the Lower Sandgate-road, Folkestone. That road was laid out in 1827 by the then Earl of Radnor, and was used chiefly by occupiers of houses

... the road, but to some extent also by other ... A gate and toll-box were erected at the ... bells being used on horses and vehicles ... The ... paying ... private road ... repaired by the ... The ... to the ... the properties belonging to a single owner. Mr. ... and not a ...

Public Authorities' Protection.

... ordered by the plaintiff, the man employed by the corporation negligently tipped some of it through the ... one in which the corporation were acting directly in the execution of a public duty, and that consequently they were not protected by the Act, and the action was not barred by the lapse of time.

Sewage Disposal.

In ... *District Council* (vol. xlv., p. 686) it was held that the only parties against whom proceedings can be taken under sec. 4 of the Rivers Pollution Prevention Act, 1876 (which relates to manufacturing pollutions), are ... produces the polluting liquids. The appeal of the council from the decision of the County Court Judge (declaring that they were guilty of an offence under the section) was therefore allowed.

In ... *Council* (vol. xlv., p. 853) two old sewers, not constructed by the council, had been in use for thirty ... and until 1909 they discharged crude ... into the Thames. In that year the council constructed ... a catchpit to intercept solid matter, the effluent from which discharged into the river. It was held that the council "caused or suffered" sewage to flow into the river, within the meaning of ... of the Thames Conservancy Act, 1894.

Town Moor.

In *Walker* v. *Murphy* some important questions relating to the use of the Town Moor at Newcastle-on-Tyne were decided. Under two local Acts of 1774 and 1870 the soil of the moor was vested in the corporation, and the herbage rights were vested in the freemen and widows of freemen. The Act of 1774 provided for certain parts of the moor being set apart for fairs and ... The Act of 1870 placed the moor under the management of a committee of ... and ... wardens, representing the freemen, and authorised that committee and the corporation jointly to appropriate parts of the moor for reviews, shows, and ... held, and granted licences for shows and roundabouts. In 1912 a licence was granted to the ... for the ... and ... declined to join in renewing the licence. The corporation, however, purported to grant a licence, upon which the defendants acted. It was held by the Court of Appeal that the licence granted by the corporation alone was invalid, and an injunction was ... committee.

Water Supply.

In ... (vol. xlv., p. 363) the company's Special Act provided that they should on request supply the owner or ... for domestic purposes, at rents based on the rental value of the premises. It was held by the House of Lords that this provision overrides sec. 53 of the Waterworks Clauses Act, 1847 (which entitles the ... Act. The guardians therefore were not entitled to ... xlvi., p. 92) the council purchased a piece of land forming part of a farm for the purpose of a reser... house buildings free of charge. The defendant, ... former and turned part of the latter into a garage. Mr. Justice Neville held that the obligation to supply the house was discharged, inasmuch as it had ceased to be the house which existed at the date of the covenant, and that, although the obligation to supply the buildings continued, the water so sup... cars.

CITY OF LONDON ENGINEERSHIP.

... of London the following resolution was adopted with respect to the appointment of engineer: "That it be referred to the Officers' and Clerks' Committee, with ... concerned, and to report whether it would not be in the interest of the corporation to eliminate all valuation work from the duties at present attached to the offices of 'Engineer' and 'Surveyor,' and to make new arrangements in regard to such work; and this court do consider and dispose of such report before any steps are taken in connection with filling up the existing vacancy in the office of 'Engineer.'"

The matter will, in the first instance, be considered by the three committees of the public health department.

Problems in Modern Illumination.—This is the subject of a paper which Mr. Valentine H. Mackinney will present at a meeting of the Institute of Sanitary Engineers to be held at Caxton Hall, Westminster, on Wednesday evening next, the 3rd prox. Mr. A. P. I. Cotterell, the president, will take the chair at 8 o'clock.

Chapel-en-le-Frith Sewerage and Water Schemes.—The sewerage scheme for the Chapel-en-le-Frith, Chunky and Fernilee portions of the rural district of Chapel-en-le-Frith has been completed, at a cost of about £40,000. Altogether there is a length of between 6 and 7 miles of main and branch sewers. An additional service reservoir at Dove Holes, containing 1,500,000 gallons, and costing nearly £5,000, has also been completed. This reservoir is intended to augment the water supply to the Chapel-en-le-Frith and Wormhill districts. Many miles of extension have been made to the various trunk water mains and other extensions are contemplated in the near future. The consulting engineers for these works are Messrs. Brady & Partington, Chapel-en-le-Frith.

Billeting Troops on the Inhabitants of Towns and Villages.

By G. BERTRAM HARTFREE, F.S.I., Engineer and Surveyor to the Alton, Hants, Urban District Council

[The notes on Camp Kitchens and the Selection of a Camping Ground which appeared in our issue of the 22nd inst. were announced as the last of the series of articles which Mr. Hartfree has prepared for "The Surveyor" since the outbreak of war, but the following further contribution has since been suggested to the author by a number of appreciative readers, and is presented in the hope that it may prove helpful to municipal engineers called upon to assist in the important work with which it deals.]

The responsible local authority for billeting work is the civil police force, whose duties consist of obtaining particulars of available room, the possible number of soldiers to take up occupation, and arranging for voluntary or compulsory provision for them. In the absence of any data, the military calculate that it is possible for a force of soldiers to be billeted on an area for one week, and obtain all food supplies, in a ratio of two soldiers per inhabitant, the inhabitants providing the whole of the housing accommodation. Where food can be supplied by the military forces, and empty buildings, barns, and so forth are obtainable, it is calculated that close billeting of from five to ten soldiers per inhabitant can be effected; but, of course, in these circumstances almost every available room would be used for sleeping. A convenient ratio for populous places is one man per two inhabitants.

The sanitation in respect to home billeting is controlled by the local sanitary authority, and recent orders recognise the medical officer of health as the responsible person for these matters. Statute law and orders at present appear somewhat indefinite, and a wide gap occurs between the duties of the military, the civil police, and the health officer, and this can be filled by the local surveyor volunteering his services as technical adviser to the military units.

It is to be necessary to define his position the Defence of the Realm Act could be applied by the commanding officer requisitioning his services.

Broadly, billets may be divided under two headings—subsisted and non-subsisted. Under the former the occupier of the house provides bedding, food and full subsistence, but in the latter instance the conditions may be compared with unfurnished lodgings. Between these two classes there is an unlimited variety coming under the heading of partially subsisted billets.

In reference to subsisted billets, there possibly would be little requiring the surveyor's services; but with the remainder there would be more or less demand, according to local and special conditions. The following will illustrate actual cases:—

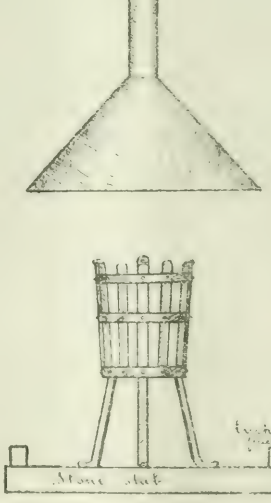
(1) A large hall used for drill purposes is required to house a number of men. In the past the sanitary arrangements were sufficient for the purpose for which the hall was used; cooking arrangements were not required, and special warming was unnecessary. At very short notice cooking arrangements, sanitation and warming is required; the existing system of sewage disposal is entirely water-borne, and there are no arrangements for scavenging earth closets. The military standard for closet accommodation is 10 per cent. In consequence, it was necessary to design a special range of earth-closets in a temporary wooden building erected near the hall. At another spot a temporary cook-house was constructed. From a spot on the roadside waste a special connection was made to a sewer, and portable wash troughs, discharging over a gully leading to this, were provided, and the whole was surrounded by canvas screens. For warming purposes tortoise stoves were provided, resting on stone slabs, with flue pipes insulated in stoneware pipes where passing through or near any woodwork.

(2) An empty dwelling-house, letting at a rental of £50 per annum.—Here the cooking, washing and heating arrangements were all-sufficient; the only problem was closet accommodation. The building was in such a position that any system of scavenging of earth-closets would be objectionable to the occupants of the buildings as well as neighbouring houses, and, in consequence, it was necessary to provide additional water-closets. These were connected to a drain jointed with a plastic composition, so that when billeting was discontinued the whole could easily be removed. The roofs were covered by iron sheets, and the whole screened with canvas.

(3) Empty shop premises, dwelling-rooms and stores.

In the shop and dwelling-rooms there were sufficient arrangements for heating, washing and cooking; but there were insufficient closets, and, of course, there was not a sufficiency at the stores, which were not heated, and were without the other conveniences, making necessary the provision of special kitchens, latrines and stoves.

The provision of these things puts an unusual complexion on the ordinary conditions of landlord and tenant. Under their powers the military are justified in requisitioning the premises, but presumably they cannot insist on the owner of the premises providing the additional works they require. It, however, appears common practice to require the owner to supply these, leaving a problem for the surveyor having decided what is necessary—who is to pay, and at present the only solution is in the fixing of the rent. The Billeting Acts provide that the rent shall be fixed by the officer commanding the unit, the civil police and the owner; in consequence, it may be to the owner's advantage to provide these necessities and to recover in rent. General practice on the part of the military appears to be that the owner should provide everything, charging a covering rent. In fixing this there should be taken into consideration, firstly, a fair rent for the premises made; the special circumstances; secondly, the landlord's outgoings in respect to water, gas, rates, &c.; thirdly, any special expenses to which the landlord has been put. These are based on the weekly rental, but in computing this rental it must be borne in mind that the Army allowance is from 1d. to 3d. per man per day, according to the circumstances, though when leaving the billets there may be justifiable claims by the owner for compensation for damages.



Flue Device with Hood to Collect Coke Fumes.

The emptying of temporary earth-closets presents

[illegible] that has a water-borne system [illegible] sufficient for the purposes of the civil [illegible] and may be used under ordinary [illegible] the exception of the earth system. Under these circumstances it was recommended that the [illegible] and the sanitary inspector, as a voluntary assistant, and not as an officer of the local authority) should arrange with a contractor to empty all [illegible]. The owners of the premises paid the cost [illegible] and the amount [illegible] was reimbursed in the rent charges.

A problem for the health department was the offal from cooking for batches of 200 men; this was settled by finding suitable contractors, who removed it free of charge.

Another problem affects growing villages that have no system of sewage disposal. Here, possibly, previous to the arrival of the military, the need for some [illegible] had never been felt. The sudden influx of large [illegible] has intensified the necessity and [illegible]

SCHEDULE I.—WORKS REQUIRED.

[illegible] Street, Bute Road, Cardiff. Erected [illegible] Brittany House, Yorkstreet, Hafod.

[illegible] quarters for [illegible]

Provide [illegible] per closet

Provide [illegible] for 200 men

Water [illegible] supply

Provide [illegible] each kitchen

Light three rooms [illegible] lighted

Provide [illegible] complete.

Provide [illegible] Drawings [illegible] marked "X."

Observe.—Repair doors, [illegible] windows, repair roofs, [illegible] and repair [illegible] drawing-room and [illegible]

SCHEDULE II.

[illegible] Bute, Royal Calfercias Road, [illegible] Brittany House, Yorkstreet, Hafod.

[illegible]

Weekly [illegible] ascertained rate
Only [illegible] assessed at [illegible] weekly
Estimated weekly value of depreciation ..
Fair [illegible] unfurnished and [illegible] premises

Weekly rentals [illegible] £2 [illegible] £1 [illegible] £2 [illegible] Equalling [illegible] per [illegible] week and [illegible] with [illegible]

SCHEDULE III.

[illegible] Bute, Royal Calfercias Road, [illegible] No. 9 Highstreet, Hafod.

Owners outgoings [illegible]
Less value after use

On the week [illegible]
Proportion of rates ...
Less consumption
Depreciation of property
Fair rental as forced [illegible] requirement of property
Owners' weekly expenses [illegible] earth closets

[illegible] per week by £1 [illegible]

dible scavenging [illegible]. A common [illegible] practice is the use of a street tumbler cart, pails being carried out and emptied into it. A better practice is the provision of tub pails, two to each closet, with suitable vans so arranged that the full tub is removed from the premises in a suitable cart, and a clean tub, previously lime-washed internally, is left in its place. This avoids objectionable slopping found in elementary sewage disposal.

When premises are taken at short notice there may be difficulty in obtaining sufficient stoves for heating, as the influx of a large number of troops absorb the whole of the portable heating arrangements in the locality; in addition to the demand for warming the rooms, there may be a necessity for drying wet clothing. In one case, owing to the absence of more suitable appliances, I arranged for the installation of the familiar brazier, a hood being provided to carry away objectionable fumes.

In completing billeting areas it is advisable—first, to ascertain the total number of men to be provided for and the available room; secondly, to divide the area into suitable divisions for each battalion, these being again sub-divided for companies [illegible] town in the short period of twenty minutes. This [illegible] which bore the names of occupiers of houses, with [illegible] soldier who was to occupy a particular place.

[illegible] quarters, containing offices, orderly-room and guard-room. (2) Medical inspection room with laboratory attached, and, if possible, quarters for orderlies. (3) Quartermaster's stores; these require at least a 500-ft. floor space—more if possible—with shelves for clothes, and separate room for ammunition, and special bread and meat stores. (4) Four rooms for company officers, with small stores attached. (5) (5) Stables for from twenty to thirty horses. (6) Workshops for armourers, pioneers, tailors and shoemakers.

Schedule No. [illegible] requirements to be carried out to an empty building to render it fit for use for billeting; and Nos. 2 and 3 are examples of rent valuation.

HOUSING AT CARDIFF.

CORPORATION SCHEMES.

A housing and town planning conference was held at Cardiff last week, under the auspices of the National Housing and Town Planning Council, the Welsh Housing Association, and the South Wales Garden Cities and Town Planning Association.

In the course of the proceedings a report on housing schemes undertaken by the Cardiff City Council under Part III. of the Housing of the Working Classes Act, 1890, was submitted by the city engineer, Mr. W. Harpur. Under Scheme I., thirty houses, he said, had been erected in Kitchener-road at a cost of £5,280, or £176 per house. The houses were let at 7s. per week, which it was estimated would cover the cost of a sixty years' loan, street works, rates, insurance, water, maintenance, supervision, and collection of rents. The houses were erected upon a site which was the property of the corporation, and a ground rent of £2 per annum was charged upon each house, which represented the repayment of the loan charges and interest on the cost of land.

Under the Splott scheme 144 houses were being erected on property leased from the Marquis of Bute at £30 per acre, which was about half the ground rent usually charged in Cardiff, and in this matter his lordship had met the question of housing very handsomely. The contract price was £22,048, or an average of £153·1 per house, and it was proposed to let the larger and smaller houses at rentals of 6s. 9d. and 6s. 3d. per week respectively, which it was estimated would cover all loan charges and expenses.

Scheme No. 3, under which it was proposed to build thirty-one houses in Kitchener-road, Eldon-street, and Railway-terrace, was in course of preparation, and the details were not yet available. Mr. Harpur stated that what had been aimed at in these [illegible] was to provide suitable houses for [illegible] families, with all the necessary sanitary conveniences, including a bath with hot and cold water supply, at the lowest possible rents on the basis of self-supporting schemes. To enable this to be done it had been necessary to ignore some desirable ideals in the planning, and particularly by the erection of a larger number of houses to the acre than idealists allowed, and by the bringing of the front of the houses on to the street line without providing any forecourt or front garden.

Limerick Surveyors' Salaries.—At a meeting of the Limerick County Council on Saturday a letter from the Local Government Board relative to the proposal of the council to grant increased salaries and allowances to the county surveyors was read. The board intimated that they were advised that the procedure of the council in the matter was irregular, and that the question of granting the increases must be dealt with afresh. It was decided to hold a special meeting to consider the matter.

The Legislation of 1914 in Relation to Municipal Engineering.

A great proportion of the legislation of the past year was necessarily concerned with matters directly or indirectly arising from the war, and the only statutes calling for notice in this column deal with the alteration of boundaries in Scotland, the continuance of various expiring laws, housing and public works loans.

Alteration of Boundaries (Scotland).

The Local Government (Adjustments) (Scotland) Act provides that on any adjustment under sec. 50 or 51 of the Local Government (Scotland) Act, 1889, or sec. 46 of the Local Government (Scotland) Act, 1894, provision shall be made for the payment to any authority of such sum as seems equitable, in accordance with the rules contained in the schedule to the present Act, in respect of any increase of burden which will properly be thrown on the ratepayers of the area of that authority as a consequence of any alteration of boundaries. This provision will apply to any adjustment consequent upon an alteration of boundaries effected after the passing of the Act made (otherwise than by agreement) under any of the said sections, whether as originally enacted or as applied by any other Act, or by any order of the Secretary for Scotland confirmed by Parliament under the provisions of the Private Legislation Procedure (Scotland) Act, 1899. These provisions are not to derogate from the provisions in force at the passing of the Act relating to the adjustment of debt. The rules in the schedule are as follows: (1) Regard shall be had to (*a*) the difference, if any, between the burden on the ratepayers which will properly be incurred by the authority of an area in respect of which an alteration of boundaries has taken place in meeting the cost of executing any of their powers and duties, and the burden on the ratepayers which would properly have been incurred by the authority in meeting such cost, had no alteration of boundaries taken place; provided that the loss of rateable area as such shall not of itself be held to be an increase of burden; (*b*) the length of time during which any increase of burden may be expected to continue. (2) The sum payable to any authority in respect of any increase of burden shall not exceed, or, if payable by instalments or by way of annuity, the capitalised value of the instalments or annuity shall not exceed, the average annual increase of burden multiplied by fifteen.

Expiring Laws Continuance.

The *Expiring Laws Continuance Act* continues until December 31, 1915 (among other enactments), the Locomotives Act, 1865, the Municipal Elections (Corrupt and Illegal Practices) Act, 1884, the Local Government (Elections) Act, 1896, the Motor-car Act, 1903, and the Unemployed Workmen Act, 1905. Any unrepealed enactments amending or affecting the enactments continued by the Act are (so far as they are temporary) to be continued to the same date.

Housing.

The object of the *Housing Act* is to make provision for the housing of persons employed by or on behalf of Government departments where sufficient dwelling accommodation is not available.

It gives power to the Local Government Board (with the approval of the Treasury) to make arrangements with any "authorised society" within the meaning of the Act for the provision, maintenance and management of dwellings and gardens and other works or buildings for persons employed by or on behalf of Government departments on Government works where sufficient dwelling accommodation is not available for those persons. The Commissioners of Works are also empowered, for the same purpose (with the consent of the Treasury, given after consultation with the board), to acquire and dispose of land and buildings, and to build dwellings and do all other things which appear to them necessary or desirable for effecting that purpose.

The Local Government Board are also authorised (with the approval of the Treasury) to assist any "authorised society" with whom arrangements are made under the Act, on such conditions as they think fit by becoming holders of the share or loan capital thereof, or making loans thereto, or otherwise as they think fit. Where the board make any such arrangements in connection with the provision or maintenance of dwellings within any borough, the council of the borough are to have the like power (with the approval of the board) of assisting the society as the board have under the Act with the approval of the Treasury.

Expenses incurred by the council under this provision are to be defrayed as expenses under Part III. of the Housing of the Working Classes Act, 1890, and the council will have the like power to borrow for the purposes of this provision as they have for the purposes of that part of that Act.

The Treasury, as and when they think fit, are to issue out of the consolidated fund such sums as may be required for meeting expenditure which is, in the opinion of the Treasury, of a capital nature incurred (with the consent or approval of the Treasury) by or on behalf of the board or the Commissioners of Works for the purposes of the Act, not exceeding in the aggregate £2,000,000. Expenses, not being, in the opinion of the Treasury, capital expenditure, are to be defrayed out of moneys provided by Parliament, and receipts arising in connection therewith are to be paid into the Exchequer.

The Treasury may, if they think fit, for the purpose of providing money for sums so authorised to be issued out of the consolidated fund, or for repaying to that fund any part of the sums so issued, borrow by means of terminable annuities for a term not exceeding thirty years, and all sums so borrowed are to be paid into the Exchequer. The annuities are to be paid out of moneys provided by Parliament, and, if those moneys are insufficient, to be charged on and paid out of the consolidated fund. The Treasury may also, if they think fit, for the same purpose borrow money by the issue of Exchequer bonds, and the Capital Expenditure (Money) Act, 1904, is to have effect as if the present Act had been in force at the time of the passing of that Act.

Within six months after the end of every financial year the Treasury are to lay before the House of Commons accounts showing the amount of any expenditure of a capital nature incurred by the Local Government Board and the Commissioners of Works respectively, and of the money borrowed and the securities created under the Act, such accounts to be audited and reported upon by the Comptroller and Auditor-General as appropriation accounts in manner provided by the Exchequer and Audit Departments Act, 1866.

The expression "authorised society" means any society, company or body of persons approved by the Treasury whose objects include the erection, improvement or management of dwellings for the working classes, which does not trade for profit, or whose constitution forbids the payment of any interest or dividend exceeding 5 per cent per annum.

In the application of the Act to Scotland, the Local Government Board for Scotland is to be substituted for the Local Government Board, and "burgh" is to be substituted for "borough."

The Act does not apply to Ireland.

The *Housing (No. 2) Act* gives the Board of Agriculture and Fisheries in agricultural districts, and the Local Government Board elsewhere, certain powers with respect to housing. These boards respectively are empowered during one year ending August 10, 1915, to acquire and dispose of land and buildings for housing purposes. The consent of the Treasury and the concurrence of the Development Commissioners are necessary for the acquisition of property, and the consent of the Treasury must be obtained before any property is disposed of. The two boards may do everything else which appears to them necessary or desirable for "housing purposes," in connection with land so acquired, and may make arrangements for housing purposes with "local authorities" and "authorised societies." "Housing purposes" means the provision, maintenance, improvement and management of dwellings and gardens, and other works or buildings for, or for the convenience of, persons belonging to the "working classes" (of which there is no definition). "Local authority" means the local authority for the purposes of Part III. of the Housing of the Working

Cottages Act, 1890 (i.e., the urban or rural sanitary authority, as the case may be). "Authorised sewer" has the same meaning as in the Act of 1875 or the Housing Act, 1909.

No loan shall be sanctioned until the Treasury are satisfied, after a public local inquiry, either (*a*) that there is an insufficiency of dwelling accommodation for the working classes, or (*b*) that the existing [illegible] provided.

The Treasury are empowered to issue to the Public Works Loan Commissioners, out of the Consolidated Fund, such sums as they think fit, not exceeding £6,000,000 in the whole, for the purposes of this Act. Expenses incurred by the Treasury not of the nature of capital expenditure, are to be defrayed out of moneys provided by Parliament. The Treasury are empowered to borrow by issuing Exchequer Bonds, Annual payments of the capital expenditure and interest are to be paid out of moneys provided by Parliament. The accounts of the Commissioners are to be audited by the Comptroller and Auditor-General, and laid before the House of Commons, and audited by the Comptroller and Auditor-General.

The Act does not apply to Ireland, and in its application to Scotland the Local Government Board for Scotland are substituted for the Local Government Board, and the Board of Agriculture for Scotland for the Board of Agriculture and Fisheries.

Public Works Loans.

The Public Works Loans Act provides for the issue by the National Debt Commissioners of £6,000,000 for loans by the Public Works Loan Commissioners, and £600,000 for loans by the Commissioners of Public Works in Ireland. The Act also provides for the writing off of £200 of the loan of £10,000 to the Evemouth Harbour Trustees, and of portions of various loans by the Commissioners of Public Works in Ireland. It is enacted that section [illegible] of the Housing and Town Planning Act, 1909, and section [illegible] of the Housing, etc., Act, 1910, (which relate to the Public Works Loans Act, 1875, and regulating to the rate of interest on loans) shall not affect loans to borrowers other than local authorities.

That section provided that any loan by the Public Works Loan Commissioners [illegible] of 1890, or for labourers' dwellings in pursuance of the Public Works Loans Act, 1875, or any Act amending the same, should bear such rate of interest not less than £3 2s. 6d. per cent per annum as the Treasury might from time to time authorise as being in their opinion sufficient to enable such loans to be made without loss to the Exchequer. Power was taken to vary the minimum rate allowed by the Public Works Loan Commissioners [illegible] to be made to local authorities. The minimum rate allowed for the time being for loans out of the Local Loans Fund, and the [illegible] ment was repealed, but there was no provision as to the rate of interest for loans to private borrowers. The present Act makes it clear that these latter will still be governed by the provisions of sec. 83 of the earlier Act.

London Electricity Supply Bill.—It was reported to the meeting of the London County Council on Tuesday that the borough councils affected by the council's Electricity Supply Bill, which is to be submitted to Parliament in the approaching Session had been asked to support the scheme. Four borough councils were reported to have expressed that it should be proceeded with, and two had given definite replies.

Snow Removal Problem.—The borough councils of London found the clearing away of the snow from the streets last week-end an awkward problem owing to the dearth of casual labour. In more than one borough the foremen had to go into the highways and byways to obtain men. In Lambeth, where in the ordinary way 300 or 400 extra men would be taken on, there were not more than fifty applications for work. In Holborn, as a rule, there would be at least 1,000 applicants on Friday; it was not possible to raise more than about 200 extra men. In the City owing to the prompt measures taken overnight to clear the [illegible] with the latter's men and the real work and the forty more sweepers worked so well that every street, alley and court in the City was clear of snow when the frost set in.

ROAD BOARD GRANTS TO LONDON.

THE POPULATION BASIS.

The Finance Committee of the London County Council this week submitted a report on the subject of the Road Board grants to London, in the course of which it is stated that the board have made a provisional allocation of the funds available on the basis of population, and that they consider that the population ratio is the most favourable basis for London which they can legitimately adopt at the present time. They further allege that "it gives London, owing to its dense population, a considerably lower population density in relation to the roads which they are obliged to maintain."

On this question the Finance Committee are of the opinion that the funds should be allocated among local authorities, as far as practicable, according to the needs of the various areas, and that such needs [illegible] by population. The Local Government Committee, with whom they have communicated on this point, agree with this view, which was advocated on behalf of the council at the conference held between the Road Board and representatives of the council on November 27, 1913. The board mention in their report that "if the share allocated to Greater London were determined by reference to nett expenditure on road maintenance, including loan charges in respect of road-crust improvements, the percentage which Greater London would get would be [illegible] population ratio." In making this calculation, however, loan charges (except those in respect of road-crust improvements) have been excluded. In an appendix to their report the board give a table showing the total expenditure on roads in England and Wales in the year 1911-12, including loan charges for street improvements, and according to these figures the expenditure in the County of London [illegible] Wales. If, therefore, the funds were allocated on this basis, London would receive 18 per cent of the amount allocated to England and Wales—*i.e.*, about [illegible] against 10 per cent on the basis of population.

Apart, however, from the question whether population forms a fair basis of allocation, the fact remains that [illegible] to authorities in the County of London do not amount to anything like the proper share of the county even on the basis of population. The total sum estimated by the board to be available for grants in June last was £6,000,000. The board show that out of the £960,000 provisionally allocated to Greater London [illegible] £802,000 had been made or indicated, but the bulk of this sum goes to authorities outside the County of London, and these grants do not in any way benefit the ratepayers of London as such. On the basis of population the amount applicable to the Administrative County of London would be about 10 per cent of the total—*i.e.*, £600,000—but the amount of grants made or indicated to London authorities was only £127,000, of which grants amounting to £112,923 had been actually made up to September [illegible] 1913.

London County Council Tramways.—The London County Council on Tuesday agreed to a recommendation of the Highways Committee that the tramway tracks in Liverpool-road should be removed and the paving of the [illegible] carried out at a provisional nett cost of £10,000. In July, 1913, the council decided to discontinue the working of the [illegible] service upon the [illegible] tracks in Liverpool-road.

Coast Sand Dunes, Sand Spits, and Sand Wastes. (By G. O. Case. Price 5s. St. Bride's Press, Limited, 24 Bride Lane, E.C.)—"A most useful little book crammed with facts culled from all parts of the world and well illustrated with photographic reproductions and diagrams. Numerous references to other works are given. Mr. Case discusses the formation and [illegible] of sand dunes and the [illegible] encountered by them when they [illegible] inland, and [illegible] on to consider protective works and the [illegible] of sand wastes. If we have any criticism to offer it is that the book is too condensed. There is certainly not a superfluous paragraph."—*Geographical Journal.*

Waterworks Plant.

MAKERS' ACTIVITIES IN 1914.

That mechanical means of water filtration continue steadily to gain ground in England is shown by the number of such plants installed during 1914 by the Candy Filter Company, of Westminster, whose Declor system has had the distinction of being selected by the War Office authorities for dealing with the water required for large bodies of the new Army, now in course of training at various Government depots. Declor plants for purifying over 1,500,000 gallons a day having been already installed at Netheravon, Codford, Corton, Heytesbury, and elsewhere.

With regard to particulars as to the work for the War Office, the difficulty confronting that department was to produce an absolutely safe and palatable drinking water from a river which, like most rivers in this country, is liable to pollution, and also is liable in rainy weather to become physically very bad. The water therefore required to be subjected to a process which would render it bright and clear when turbid, and also always render it bacteriologically pure. These requirements have been met by the adoption by the War Office of the combined Candy mechanical and Declor filter, in which the water is first subjected to the usual mechanical filtration (employing sulphate of alumina as a coagulant, if necessary), and then to chlorination, the water being subsequently dechlorinated by the Declor system.

A type of installation for the purpose of assisting existing sand beds, which may particularly interest our readers, has been supplied to the West Hampshire Water Company for dealing with the crude and flood water of the river Avon. This consisted of circular mechanical "Pre" or roughing filters, each of 20 ft. in diameter, these being the largest size mechanical filters yet constructed in the United Kingdom.

The Candy Filter Company also specialise in filters for the removal of iron and carbonic acid from water, and have supplied plants to the Biggleswade Water Board, the Chippenham Corporation, the Cromer Urban District Council, and many authorities, for that purpose; while the Hastings Corporation, who have used Candy Filters for the past fifteen years for dealing with ferruginous waters, have ordered further Candy filters of the compound type for dealing with an additional supply of 1,000,000 gallons a day.

During the past year the Candy Company have installed for the Pontypridd and Rhondda Joint Water Board a complete chemical plant for dealing with 2,000,000 gallons of peaty, plumbo-solvent water from a moorland gathering ground, the water after chemical treatment being passed through a battery of twelve Candy mechanical filters. The Cardiff Corporation also, we learn, who have been employing Candy filters for ten years, are about to lay down further such filters for 1,000,000 gallons a day.

The first installation in England by the Candy Filter Company of mechanical filters of the horizontal type, which are most economical for very high pressures, has been laid down for the city of Truro water supply, and is reported to be of great value, even when the water to be filtered is exceedingly turbid.

The export branch of the Candy Filter Company's business continues to extend, filters having been shipped during the year to Australia, New Zealand, Malay States, Japan, China, South Africa, and Madeira.

* * * *

Messrs. Bell Bros., engineers, Calder Ironworks, Ravensthorpe, Yorks, report that during 1914 many filtration plants have been supplied for the purpose of dealing with new water supplies, and extending others that have been in operation for many years.

To the Huddersfield Corporation a second installation, dealing with 1,200,000 gallons per twenty-four hours, has been erected and put into operation, and at the present time a third installation, having a capacity of 3,200,000 gallons per twenty-four hours, is now being erected, while a fourth plant, having a capacity of 1,200,000 gallons, is now on order.

Rochdale Corporation have been supplied with a plant to treat 800,000 gallons per twenty-four hours, and Blaenau Festiniog with plant to treat 480,000 gallons per twenty-four hours, and Stratford-on-Avon Urban District Council with plant to treat 320,000 gallons per twenty-four hours. To the original plant supplied to the Tonbridge Water Company in 1907, and which was afterwards extended, further extensions have been made, and the plant now has a total capacity of 2,000,000 gallons per twenty-four hours.

In connection with the installation of mechanical filters for the Burnley Corporation, which were erected in 1908, modern methods of alumina treatment have been added, and the liming plant has also been installed for treating the mechanically filtered water, and also that from the gravity beds, the quantity of water that is now being dealt with amounting to 1,700,000 gallons per twenty-four hours.

In connection with the purification of bath-water supplies, a number of installations have been erected and put into satisfactory operation, for, among others, the corporations of Doncaster, Lancaster and Stalybridge. This special apparatus is for the circulation, filtration, aëration and reheating of bath water, and carries with it many advantages, including clean water for all bathers, a point which is now receiving special recommendation.

* * * *

The Paterson Engineering Company, Limited, Amberley House, Norfolk-street, Strand, London, W.C., report that in the department of rapid mechanical filtration the many features of superiority which the open gravity type of rapid filter has over the closed pressure type, and even over the slow sand bed, have been recognised by some of the most progressive municipalities in this country and abroad. A typical example is the Paterson rapid filtration plant at Clydebank, which was opened by His Majesty the King in July. This plant of 6,000,000 gallons daily capacity enabled the authorities to dispense entirely with the former installation of slow sand filters, which have therefore been converted by the removal of the sand into pure water storage reservoirs.

At Scarborough also Paterson rapid filters are being installed, and are practically at the point of completion. In the case of a famous health resort such as this, where it is of the first importance that the purity of the water supply should be above suspicion, the decision to instal Paterson filters, after careful comparison with the various other systems, is a tribute to the special advantages embodied in the open gravity type of rapid filter.

The Paterson Engineering Company have recently secured the contract for the installation of filtration plant for the Irvine and District Water Board, where also the installation of the rapid filtration plant is intended to enable the water authorities to discard the existing slow sand filters. This installation, which has a capacity of 5,500,000 gallons per day, is probably the most important order for rapid filtration plant placed in Scotland during the year under review.

At Waskerley the Weardale and Consett Water Company have placed a repeat order for a duplicate installation (capacity 2,500,000 gallons per day) of roughing filters for the removal of the bulk of the suspended matter from the moorland water, and for the neutralisation of the natural acidity before passing on to slow sand filters.

Business in foreign and colonial fields has also shown considerable improvement during the past year. The company have secured contracts for Kobe, Japan (8,000,000 gallons per day), and for many important schemes in India and elsewhere.

* * * *

The Kennicott Water Softener Company, Wolverhampton, intimate that they have had a most successful year, and that their latest type "K" plant is being more and more appreciated by prospective buyers, on account of the fact that it is more economical than the plants made by their competitors. During last year they installed the largest water-softening plant in the United Kingdom. This has been erected at the works of the Manbre Saccharine Company, Limited, of London, to soften and purify Thames water, not only for boiler purposes, but also for manu-

[illegible] purposes. The plant is of a normal capacity of [illegible] gallons per day.

The [illegible] Thames water is one of the most difficult [illegible] which the water contains an excessive quantity of carbonic acid, and is most essential that a softener to treat water of this nature should be provided with a most efficient means of removing the precipitated mud from the bottom of the settling tank. They claim that the only method of doing this satisfactorily is by means of their patent revolving [illegible] pipes, and that [illegible] cleaner.

The firm have also received repeat orders from the South Australian Government Railways, to whom they have previously supplied fifteen plants. Other railway [illegible] world they have installed numerous other plants. Among corporations, the Manchester Corporation have installed one of their plants of 480,000 gallons per day capacity. The firm have a very large number of orders pending, and expect this year to be very prosperous.

Royles, Limited, Irlam, near Manchester, report the installation of a water softener for softening the whole of the water used in the Gloucester infirmary, including domestic supply, boiler feed, and laundry purposes. Previously the pipes and boilers were much scaled and corroded, but since the installation of the firm's plant this difficulty has been overcome. At Bristol waterworks they have put in a water-softening plant for boiler-feed purposes—capacity, 1,000 gallons per hour. For the Olympia Oil and Cake Company, Selby, they have installed an air-cleansed sand filter. This filter is for filtering the river water, which is used for manufacturing purposes. The capacity is [illegible] gallons per hour. At the works of [illegible] Limited, Liverpool, [illegible] thorpe, the firm have erected a large lime-barium [illegible] per hour. The softened water is used for feeding locomotive and water-tube boilers. By the lime and barium carbonate treatment no soda alkalinity is possible in the softened water; also there are no soluble salts produced; consequently no priming takes place, and all scale-forming matter is removed from the water. Since the adoption of this plant all trouble, both as regards priming and scaling, has been prevented. A [illegible] gallons per hour [illegible] by the Yorkshire Dyeing & Proofing Co., Limited, Arnside, is of the same type as the [illegible] and was specially designed for trans-shipment. The large reaction chamber is built up of standard cast-iron [illegible] air-cleansed sand filter. The softened water is to be used for boiler-feed and condensing purposes. The capacity of the plant is 10,000 gallons per hour. At Whittingham Asylum, near Preston, a water-hardening and filtering plant, of a capacity of 6,000 gallons per hour, has been erected. The water at the Whittingham Asylum is of a soft, peaty character, and causes considerable corrosion and deposit in hot-water service pipes. By treatment with a little clear lime water and subsequent filtration this water is hardened to the degree required, and all action on iron and lead pipes is prevented. Another contract was for an oil-eliminating plant for the Bleachers' Association, Limited, Pilsworth. For the Sheepbridge Coal and Iron Company, Chesterfield, Messrs. Royles are converting an existing water-softening plant into their system. The old reaction chambers only are being retained. The capacity of the plant is 15,000 gallons per hour.

* * * *

Mather & Platt, Limited, Park Works, Manchester, electrical, gas, textile, hydraulic and fire engineers, have had, under the circumstances, a very satisfactory year's business in all their branches. The firm have completed the several large installations of mechanical filters which were mentioned in last year's issue—namely, for the Sheffield Corporation, Rhymney and Aber Valleys Water Company, Fraserburgh, the South Staffordshire Waterworks, and in addition have supplied batteries of filters to the Grahamstown Waterworks (South Africa), the Chesterfield Rural District Council, Llandrindod Wells Urban District Council, and many other important waterworks at home and abroad, including the Malay States, New Zealand, and other colonies. A very important installation has been erected near Calcutta to supply the district owned by the Alliance Jute Mills with drinking water for their workspeople, as well as for general use in the mill. This installation has caused widespread interest in waterworks circles in India on account of the exceptionally good results obtained when filtering river Hooghly water, even in its worst state. The Tynemouth Corporation have also installed one of Mather & Platt's filters, and are making experiments, with the intention of adopting mechanical filters for the purification of the water supply of the whole district. Mather & Platt are now engaged on a most important installation for the Oldham Corporation waterworks, comprising eighteen filters, each 9-ft. diameter, to deal with [illegible] gallons per hour. When completed this will be one of the most up-to-date installations of mechanical filters in the country. A notable success has been achieved with their novel [illegible] proved to be efficient and economical.

The firm have supplied turbine pumps for increasing duties—widening their sphere of efficient usefulness. Large numbers of their well-known multi-chamber type pumps have been installed in collieries, where the duties have frequently been in excess of 1,000-ft. lift. They have further installed pumps of similar type for hydraulic purposes, generating a [illegible] field for the adoption of turbine pumps is for boiler-feed duties. Mather & Platt have installed quite a number of such pumps driven by belt, by motor, and by steam turbine. All such pumps have given every satisfaction. Their low-lift type of pump continues to find favour for varied uses, and a recent adaptation of this pump has been supplied to paper makers for handling pulp. The design of the pump lends itself to rapid examination, having the cover in two parts, the outer part being hinged, and held in position by wing nuts. The impeller is of the non-shrouded type. Should there, therefore, be any congestion or other impediment, the pump can be examined internally in a very short time, and the joint easily and quickly made.

[illegible] pany have supplied several filtering installations for the purification of water supplies, the principal of these having been a large installation for the Morley Corporation, and another for abroad.

They have also supplied some small filters suitable for 100 to 300 gallons per hour, for the purification of drinking water for small country village supplies, the simplicity of this type of filter being much appreciated where the filters are looked after entirely by unskilled labour.

In connection with the purification of water in swimming baths, the "Turn-Over" filter and purification apparatus continues much in favour, an order having been received recently by the firm from the Batley Corporation for a filtering plant similar to that supplied to the Brighouse Council.

In connection with this work, by the "Turn-Over" filter system of purification, a guarantee is given for the production of an absolutely colourless water and the elimination of pathogenic germs.

The company believe in the motto "Seeing is believing," and therefore invite inspection of their plant, as they think this is more likely to convince people of its advantages than anything else.

Pumping plant supplied by the Pulsometer Engineering Company, Limited, includes an installation at the West Gloucestershire Company's California pumping station, consisting of two deep-well pumps with pump barrels fixed 300 ft. below the ground level, delivering into a water softener on the ground level, the softened water then being pumped by a Pulsometer high-efficiency turbine pump to a reservoir 3 miles away, against a head of about 350 ft., [illegible] pound condensing steam engine. This installation, which is working very satisfactorily, is of interest, inasmuch as the high-speed turbine pump, running at 1,000 revolutions per minute, is working in series with a slow-speed well pump working at 15 revolutions per minute. Another installation is at Winchester, consisting of two high-speed Pulsometer

turbine pumps, direct coupled to a high-speed gas engine, the pumps being arranged so that one pump only can be used for pumping into the main reservoir, and when coupled direct both pumps can be worked in series and then deliver water into the high-level reservoir. The gas engine and pumps are mounted on one bedplate, and make an exceedingly compact combination.

* * * *

George Kent, Limited, 199 to 201 High Holborn, London, W.C., report: During the past year a record has been established in the number of Venturi meters manufactured by them, the actual output being greater than at any previous period in the firm's history. Among the many contracts secured by them during 1914 may be mentioned those for the Venturi meters for the Egyptian Government in connection with the Nile Delta drainage project at Baltim and Mex pumping stations. An exhaustive series of trials have been carried out under the supervision of the Egyptian Government engineers to test the accuracy of Venturi meters against specially constructed tanks of known capacity. The results obtained with the meters were highly satisfactory, and but for the outbreak of war considerable contracts for the Agricultural and other departments would doubtless have been received. With regard to the prospects for 1915, although the firm's general business is bound to be affected to some extent by reduction in municipal expenditure, the outlook is tolerably good, and it is confidently expected that the business already in hand, and any that may come along, will keep them well employed at any rate during the first half of the year.

* * * *

Ruston, Proctor & Co., Limited, Sheaf Ironworks, Lincoln, report: Among the large number of gas and oil engines supplied by us in 1914 we would mention, in connection with United Kingdom water supply schemes, the semi-Diesel engines supplied to the Sandgate Urban District Council for their waterworks, and the three coupled gas engines, each of 120-b.h.p. test load, supplied to the Sheffield Corporation, in connection with a new reservoir scheme in Ewden Valley. Two of the gas engines will work on anthracite or coke as fuel, and the remaining one on wood refuse. They are arranged to drive direct-coupled dynamos by means of rope gearing. These engines are similar in design to the double set of Ruston gas engines erected and started at the Ryde waterworks last year.

* * * *

During the year 1914 Messrs. Tangyes, Limited, Birmingham, have been improving the details of their various gas engines, and have now introduced their "H" type gas engine, with "hit-and-miss" governing. With the exception of the variable admission governing, this embodies all the leading features of their "T" type gas engine. The firm are also offering their suction gas producers with revolving plate grates for use with anthracite, gas coke and charcoal. This type of grate enables very small-size fuels to be used, and the ash, &c., can be readily cleared from the fire grate. A further improvement is the introduction of Messrs. Tangyes' patented arrangement on the crude oil engine, semi-Diesel type, which makes it possible to start the engine from cold without the use of petrol or other light spirit, and without the use of a lamp or external heat of any kind. This is effected by means of electric ignition and without the use of high-compression pressures. The introduction of the firm's famples- to-fined oil engine belongs to the current year.

* * * *

The Ransome-verMehr Machinery Company, Ltd., Brunswick House, Westminster, obtained early last year a filtration contract for treating 60,000,000 gallons of water per day for the Toronto Municipality. The contract price was, approximately, £220,000, and included not only the firm's system of Ransome continuous filters, but all buildings, foundations, pipe track, pumping apparatus and coal-storage buildings. The contract was a joint one, the Ransome-verMehr Company being responsible for the engineering portion of the work, and Messrs. William Cowlin & Son, of Bristol and Toronto, for the building portion, including the pipe track and the foundations. The execution of the work has been carried out expeditiously up to the present moment. One half of the equipment is to be completed and ready for working by September 30th, and the balance by December 31st next. The company have also carried out a contract for the Crown Agents for the Colonies for the supply of Ransome continuous filters to treat 3,000,000 gallons of water per day. The plant consists of ten filters, and the firm have also furnished their patented coagulating apparatus for the addition of alumino-ferric to the water under treatment. This plant is for the Kingston General Commissioners, Kingston, Jamaica. The company have completed the erection of three 10-ft. Ransome filters for Mr. Thos. F. Harvey, the waterworks engineer of Merthyr Tydfil, these filters being guaranteed to treat 1,200,000 gallons of water per day of twenty-four hours. In addition, they have executed a number of orders for single filters for waterworks companies and railway companies both at home and abroad.

* * * *

In cases where the lime process is employed it is possible to obtain excellent apparatus for adding lime to the water in exact measured quantities, so that water may be softened or treated with an excess of lime for sterilisation in accordance with Dr. Houston's recommendations in the case of the London supply. Plant such as that installed by the United Water Softeners, Limited, Kingsway, at a good many places during the past year demonstrate the ease with which water may be so treated.

It is also evident, however, that a very formidable competitor to the lime process in the softening of public water supplies is the much-discussed "Permutit" process, which has now been tested in this country for over four years, and certainly appears to have justified the claims made for it on its introduction. A large water-softening plant on the "Permutit" system has been installed by the West Cheshire Water Company at their pumping station at Hooton, Cheshire, which supplies some eight townships.

The great advantages of the "Permutit" process as applied to the treatment of public water supplies are its compactness, and the fact that neither sludge nor precipitate is formed at any stage of the process; while the removal of the hardness of the water is complete.

"Permutit" softeners have now been installed by the Portsmouth, Hampstead, Fulham, South Shields, Braintree, and several other Boards of Guardians at their infirmaries, with very satisfactory results; as well as by H.M. Office of Works for the Royal Courts of Justice, and a very large number of private users in town and country.

During the past year some exceptionally interesting results have been obtained by combining the Lassen-Hjort and "Permutit" processes in the same softening plant—the combined process being especially applicable to waters of initially high degrees of hardness which would be too expensive to treat entirely by "Permutit." In such cases the bulk of the hardness is removed by lime treatment, and the water then finally filtered through a layer of "Permutit." This process has been successfully adopted by Messrs. Woolcombers, Limited, of Bradford, at their Wapping works; Messrs. Wm. Playne & Co., Limited, Minchinhampton, Stroud, and many others.

Wall Calendar. An excellent wall calendar reaches us from Messrs. W. E. Horsman & Son, 127 Pendelton road, Streatham, S.W., the well-known specialists in general sanitary fittings and ironwork. Of moderate size, the date tables are yet sufficiently large to enable them to be read without difficulty at a reasonable distance, and the usefulness of the calendar is enhanced by the postal information which finds a place on the back sheet.

Public Health Law. This concise little work[1] has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

[1] A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

Road-Making Materials and Appliances.

MANUFACTURERS' REPORTS FOR 1914.

efficiency and speed in spraying operations are a ing, spraying and gritting roads, the sooner are the public able to enjoy the benefits of the process, the advantage of any spells of fine weather, for the rapid output of their machines renders them pre- work in the quickest possible time. The satisfaction given by the Taroads Syndicate, Limited, under the supervision of its chairman, Sir Herbert Mackworth Praed, Bart., is proved by the annually increasing mileage of roads treated by the syndicate. In the year 1914 all previous records were, we understand, eclipsed. The Taroads Syndicate, Limited, who are interested in matters concerning the surface treatment of roads.

* * * *

Among the roads laid by Highways Construction, Limited, Finsbury-court, London, E.C., during 1914 may be mentioned a section in Essex, about 6 miles long, between Romford and Brentwood; a contract 23,000 sq. yds. already laid there, and a stretch of named is an interesting modification of the firm's previous practice, and consists of two-coat work on system, which is known as voidless asphalt macadam on account of the perfect density secured in mixing the asphalt, is applied in four different methods, according to the character of the road and the estimated traffic to be borne by it. These are: (1) Single-coat work, where an excavated road is laid with a binder course of asphalt macadam and sealed with a flush coat of pure bitumen; (2) double-coat work, in which a wearing carpet of asphalt is laid on the macadam roads (without excavation or scarifying) and on granite setts; (4) asphalt paving on concrete foundation to meet the requirements of city streets. around London at Hornsey, Kensington, Wandsworth, large contracts have been carried out at Cornwall, Bristol, Cheshire and Surrey.

* * * *

with the special advantages of the well-known increasing year by year, report the Oxford Steam Plough Company, Cowley, Oxford. During the past year the firm have designed a special one, and two-tyne scarifier for use on small tandem patching rollers an asset to rollers of this description, since patching can only be done successfully after the surface of the road has been picked up. This scarifier is fitted on the right-hand side of the roller, immediately in front of the hind road wheel, and, being always ready when required, dispenses with the necessity of extra men following the roller about from place to place for the purpose of picking up the road before putting on the patching material, a fact which will readily appeal to road-roller users with whom economy is a consideration.

Creosoted deal paving long ago established itself as an economical system of paving for city thoroughfares with heavy omnibus traffic, and its usefulness has been more pronounced than ever since the advent of heavy motor omnibuses and other such vehicles. During the past year, however, there have been many extensions of this system into suburban thoroughfares, and in many cases large areas have been laid in thoroughfares bounded by hedges and ditches. The use of old road metal—where it is sufficiently clean—for concrete and a shallow block brings this paving into a much larger sphere, and as soon as the war permits prices to be somewhere near normal a very large amount of this paving will, the Improved Wood Pavement Company, Limited, 46 Queen Victoria-street, London, E.C., inform us, probably be put in hand.

Sales of the Gold Medal Tarco of Messrs. R. S. Clare & Co., Limited, Stanhope-street, Liverpool, are steadily increasing, and its use is becoming more popular than ever among surveyors, as will be shown by a reference to our map shown on p. (2) of the present issue, which clearly indicates that Tarco is used practically all over England and Wales. Of course, its use is not confined to this area by any means, very large quantities also being employed in Scotland and Ireland, to say nothing of an extensive colonial trade. The company find that surveyors are tending, owing to their growing conviction of the failures of tar-macadam, when constructed with ordinary tar, more and more toward the use of a standardised binder which contains the constituents so necessary to produce the maximum adhesive power —namely, a considerable proportion of pure bitumen and other agglomerating substances—and such a material, it is claimed, is Bi-Tarco. A large number of surveyors are now specifying for this material when purchasing coated stone from quarries. The firm's other bituminous compositions used in road construction are well known. With regard to the company's tar-spraying machines, these embody the very latest principle, and combine a maximum of efficiency with a minimum chance of breakdown.

During the past year, in addition to the ordinary activities of the Cliffe Hill Granite Company, Limited —of Markfield, near Leicester—in the way of supplying granite setts, kerb, and broken macadam, they have established a well-equipped and up-to-date works for coating their well-known Cliffe Hill granite with any of the proprietary compounds, and with their own bituminous binder. The Cliffe Hill granite is eminently suitable for tarred macadam, and the firm's enterprise is proving a great success, their bituminous coated granite having been supplied to many county, urban and rural district councils. The Cliffe Hill artificial stone paving, hydraulically pressed, and every piece guaranteed of a uniform quality right through, thus giving even wear, is still finding further favour with the largest users of paving, and their architectural dressings, cills, heads, coping, &c., are also in good demand, either in plain concrete or coloured to specification. The developments at the quarry itself from which the granite is obtained are of a progressive nature. The lower beds of granite are being worked, and the quality still holds of "the best," as evidenced by the numerous repeat orders.

* * * *

Millars' Timber and Trading Company, Limited, during the year 1914 experienced very great difficulty in obtaining ships from Australia to transport Jarrah paving planks to England fast enough to cope with the greatly increased demand for Jarrah. This difficulty has now been surmounted, and the company are in a position to execute orders to any extent promptly from stocks now landed.

During last year Messrs. Mann's Patent Steam Cart and Wagon Company, Limited, Pepper-road Works, Hunslet, Leeds, did a considerable amount of business in road plant with public bodies, and especially with their small patching rollers. Among other customers during the twelve months were the Liverpool Corporation, Nuneaton Corporation, Worcestershire County Council, Durham County Council, Hebden Urban District Council, Leeds Corporation,

and the Barry Urban District Council. In addition to the above, the firm have sold several of the Aitken patent pneumatic tar-sprayers to the Aitken Tarroads Syndicate, of Glasgow, and these have been very extensively used both for road construction and for treating existing roads mostly in Scotland. As our readers are aware, Mr. Aitken is the county surveyor for Fife, who has specialised on the question of dustless roads, and his machines are now constructed so as to deal with the heaviest bituminous compounds. In addition to patching rollers and tipping wagons for road construction the firm have also supplied a number of municipal wagons with interchangeable bodies for dealing with refuse collection and road watering. Their orders have included a further order for the borough of Devonport, who already have seven of their machines in regular every-day work.

The Adamant Stone and Paving Company, Limited, of Palace Chambers, 9 Bridge-street, Westminster, S.W., have had a very busy year during 1914 supplying their Nonslip "Aberdeen Adamant" footway paving slabs. They have been fortunate in obtaining freights, and as much as 15,000 yds. super. of paving was shipped during one week from Aberdeen to London, in addition to cargoes for other ports. They have also kept up their large stock of paving slabs at their works at Dancing Cairns Quarries. At the present time they are able to deliver paving in large quantities regularly, twice a week, to London, thus enabling them to maintain large stocks on their various wharves, from which immediate deliveries are effected.

The British Westrumite Asphalt Company, Limited, Imperial-road, Fulham, London, S.W., report that since the completion of their refining and liquefying factory in July last, they have been very fully occupied. They have laid sections of various specifications, including 1-in., ¾-in., and ⅝-in. Westrumite asphalt carpet to ordinary macadam roads; also their asphalt is being used very extensively in connection with tar-macadam as a void sealer. Briefly, the specification is: On prepared ground 2½-in. layer of 1¾-in. mesh tar-macadam, consolidated to 1¾-in., 1¼-in. layer of ¾-in. mesh tar-macadam, consolidated to 1 in.; then take Westrumite asphalt and limestone dust in proportions specified—which makes a very fluid grout. This is broomed over the tar-macadam surface until the voids are completely sealed. By reason of this Trinidad asphalt grout being applied in a cold, liquid state, and the temperature being similar to the tar-macadam, wherever there is a crevice this grout will trickle in and solidify. Therefore it will be seen that the tar-macadam immediately takes a place with asphalt-macadam, as, the voids being permanently sealed, all tar-painting is entirely done away with. The company have other specifications which apply to tar-macadam, and which are being taken up by surveyors very largely, as they can men can fix and seal the work, without any danger of trouble after. The orders in hand for 1915 will keep the firm very busy indeed.

The supply of Carmac was started by Clarmac Patent Asphalt Company, Limited, in the middle of 1911, and the material as a tar and colchbat fine slag coated with tar to Road Board specification—found such instant favour that, in order to cope with the demand, Clarmac Roads, Limited, was formed. The original works at Bilston soon proved insufficient, and fresh ones were secured at Chatterley. A Ransome combined drum and mixing plant is being installed at each to make sure to meet the demand, and the company have already supplied Clarmac to the Southend-on-Sea, Maryleboue, Beckenham, Coventry, Edmonton and Aldershot councils, among others.

A large amount of interesting road work—both tar-macadam and bituminous—has been carried out during the past year with Koehring hot mixers supplied by Messrs. A. A. Byrd & Co., 50 Cannon-street, London, E.C. The Essex County Council have laid a fine stretch of bituminous road through Epping on towards Harlow, and also at Barking-side and Ilford, and, owing to their success with this machine, have given repeat orders. The Kent County Council have continued the Bromley-Sevenoaks main road, and have reached a point beyond Knockholt. This road is well worth inspection, and the materials have been entirely made by a Koehring mixer. Messrs. Byrd have now in hand the second repeat order from this council. The Bucks County Council have two of these machines at work, and have done some fine tar-macadam work with them on the Beaconsfield and Penny Stratford districts. A number of Scottish county councils adopted these machines last year, and are doing most successful work with them. Some of these are being used in the quarries, the metal flowing direct from the stone breaker into the hopper on the hot mixer, the finished material being elevated on a special hoist attached to the machine and discharged direct into the wagons. A number of machines are on order for delivery this year.

During 1914 Messrs. John Yates & Co., Limited, Aston Manor, Birmingham, did more than ever with county and other councils in road-making tools, tar-boilers, sprayers, &c. They quite anticipate 1915 will be a very good year for that department of their works, as many roads which have been literally churned up by heavy motor traffic in connection with manœuvres and transport will have to be repaired. They also anticipate that the withdrawal—more or less—of German competition will increase the demand for their British tip wagons and British diaphragm pumps. Since the commencement of hostilities the demands made upon the works by the British Government and the Allies have been exceedingly large, so much so that the firm are one of those whose men are not accepted by the Government as recruits, as it is considered they can serve their country equally well here; but the company have made special arrangements to give the best possible attention to all their regular clients during these trying times, recognising that upon the cessation of hostilities it is to them they will have to look for the maintenance of their output and the continuance of their prosperity.

Messrs. T. Toward & Co., Limited, Ouseburn, Newcastle-on-Tyne, have again experienced a busy year in the special goods they manufacture in the shape of road-makers' and contractors' plant, and so forth. Since the outbreak of war they have been kept exceedingly busy on accelerated Admiralty work. They have also been successful in securing a fair amount of orders that were previously sent to Germany. In connection with tar plant, they have experienced a large increase in the demand, particularly in tar-macadam mixing plant of their special design, which gives a continuous output.

A year of considerable activity is reported by the Dussek Bitumen Company, Canal Bank, Deptford, London, S.E. The use of "Trinidite," the firm's natural bitumen binder for grouting macadam, is rapidly extending, and their "Bitite," employed in place of pitch and oil for grouting granite setts and laying wood block paving, is also making good headway. "Trinidite," it may be mentioned, has been laid by the Middlesex County Council on the St. Albans road, the work, it is claimed, being the longest length—1¼ miles—yet carried out with any material on the grouting principle. In nearly every case the material has been put down on motor-'bus and other heavy-traffic routes, and it is giving entire satisfaction, there being no single instance of failure.

The Tarmac Limited, Ironsmill, Wolverhampton, are the only firm engaged in supplying tarred macadam to all parts of the country. During last year they supplied the following county councils with material: Berkshire (14,000 tons), Oxfordshire (30,000 tons), Hampshire (20,000 tons), Warwickshire (40,000 tons), Worcestershire (15,000 tons), Lancashire (13,000 tons), Gloucestershire (38,000 tons), Wiltshire (6,000 tons), Notts (30,000 tons), Derbyshire (6,000 tons), Carmarthen (2,000 tons), Somerset (5,000 tons), East Sussex (3,000 tons). All these orders were in connection with Road Board schemes for main road construction. It may also be mentioned that arrangements have been made at other works for the supply of much larger quantities. The firm have a huge quantity for disposal this

year, and the quality of the material is being thoroughly maintained.

The road material supplied by the Anglo-Mexican Petroleum Products Company, Limited, of Finsbury Pavement, London, E.C., and known as all asphalt. The Anglo-Mexican Mexphalte, which is practically free from grit and has the quality of increasing in value and durability during the first years. The various types of [illegible] mixing plants, approved by the Board of Agriculture and Fisheries, are capable of turning out first-class material by the most [illegible] process in exact and standardised character can readily be attained in its use. Considerable progress has been made of late [illegible] for the manufacture of asphalt-macadam, the Anglo-Mexican Company having designed an entirely new portable mixing plant constructed on one chassis, which can be hauled by an ordinary 5-ton tractor, and capable of [illegible] any [illegible] of Mexphalte macadam per day. This plant, which [illegible] has been [illegible] to meet the demands of [illegible] ture their own asphalt-macadam, and is so designed that there is complete and easy control of temperature throughout the mixing process. The alternative method of using bitumen—*i.e.*, for grouting—is also very successful, and numerous reports of its use in this direction from all parts of the country during the past year point to its economy and efficiency under heavy traffic. As an example, it may be mentioned that a Mexphalte grouted road in [illegible] Yorkshire, which was subjected to exceptional stresses owing to the passage of heavy guns for the coast, emerged from the ordeal quite successfully, whereas a tar-macadam road in the locality showed signs of damage under the same conditions. The practical cessation of the import of German asphalt for mastic blocks has stimulated the use of Mexphalte for the manufacture of mastic asphalt, and it is satisfactory to note that the products from British sources of supply are fully equal to those produced from foreign materials. During the war the company is offering specially low prices to public authorities in order to co-operate as far as possible with efforts made to relieve local unemployment by carrying out road construction work. Their liquid bitumen for road dressing, known as Fluxphalte, is also finding an increasing market, especially abroad. In South Africa, where the condition of the roads calls for urgent treatment, Fluxphalte has been largely used for surface spraying with admirable results. With regard to work [illegible] roads treated with Fluxphalte early in the year are entirely satisfactory, the dressing having furnished an efficient dust-layer during the summer and protecting the road from wear during the wet winter months.

MOTORS AND THE ROADS.

THE QUESTION OF CONTRIBUTIONS.

Addressing a meeting of the Executive Council of the County Councils' Association at the Westminster Guildhall on Wednesday, Mr. Herbert Samuel, President of the Local Government Board, stated that the Government would appoint a committee and ask Parliament to appoint another to deal with two aspects of motor traction—the technical question of weight and construction, and the wider question of the proper payment the owners of those vehicles ought to make, if any, towards the upkeep of the roads.

In war, as in peace, motor lorries, motor 'buses and traction engines tore up the country roads, although the energies of a considerable number had been devoted with even more success to the roads of France and Belgium. (Laughter.)

The Road Contractor's Joke.—A Devonshire road contractor was being taken to task by his surveyor because he had not the required quantity of road metal broken and ready for use. "What can I do?" the old man asked. "I can get no help. My son, who used to assist me, has joined the Navy, and is now with the North Sea Fleet. If you tell me I must get the stone," he concluded, "I will send to Sir John Jellicoe—tell him the roads cannot wait, and that he must send my son home."

ASSOCIATION OF SOMERSET SURVEYORS.

ANNUAL MEETING AT BRISTOL.

The [illegible] Association of Somerset Surveyors was held at the Merchant Venturers' College, Bristol, on Saturday last, when there was a [illegible]

Mr. W. A. Collins, surveyor to the Bridgwater Rural District Council, took the chair, and introduced Mr. F. W. Jones, ASSOC.M.INST.C.E., engineer and surveyor to the Frome Urban District Council, the new president.

In the course of his inaugural address Mr. Jones reminded the members that since the last annual meeting many things had transpired to alter their relationship. In March last they parted with Mr. Chapman [now county surveyor of Kent], whose deep interest in the association was always so helpful. In his place they had the pleasure of welcoming back among them Mr. Stead to the position of county surveyor, which position they knew he would fill with honour to himself and helpfulness to them all. Mr. Stone also had left them to take up the important appointment of county surveyor in North Devon, and their best wishes had gone with him. Proceeding, Mr. Jones said the advent of the war had affected the past year's work, as it had affected all other undertakings in the country in a greater or lesser degree, and they were left to regret the reduction it had caused in the number of their meetings and, consequently, the number of papers presented for their consideration. In the interests of the association he must emphasise the necessity for a more generous response to the requests made from time to time for papers, and he intended to suggest to the Executive Committee the desirability of drawing up a list of subjects upon which papers would be acceptable. If that suggestion were followed they ought to get from eight to twelve papers every year, and in so doing they should materially strengthen the usefulness of the association.

A vote of condolence was passed with Mr. F. Parr, borough surveyor of Bridgwater, in his recent bereavement by the death of Mrs. Parr, after a long and severe illness.

Messrs. W. A. Collins and J. Ace Beynon were elected vice-presidents, and Mr. D. Edwards, borough surveyor of Taunton, was re-elected secretary.

The Executive Committee were elected as follows: Messrs. Geo. Alves, Chas. Durie, Edward Stead, F. Parr, R. Stephens, L. Caplen, C. H. Sunderland, and J. Johnson.

With regard to the premium scheme, the best paper submitted during the year was by Mr. Chas. Durie, surveyor to the rural district council of Williton, entitled "(1) Highway Administration in the Williton Rural District; (2) The Acland Highway Act Amendment Act, 1885." The premium, to the value of two guineas (given by Mr. H. T. Chapman, county surveyor of Kent), was duly presented to him.

Three new members were admitted, making a total of sixty-three.

The president gave a hearty welcome to the visitors, who included Mr. Owen Baines, of Paignton.

Mr. F. Parr, borough surveyor of Bridgwater, was elected an honorary life member of the association in recognition of his untiring energy and influence in the welfare of the association.

The members were subsequently entertained to tea by the president.

Housing of Ayrshire Miners.—The copy of a report forwarded to the Local Government Board, and compiled by Mr. David Andrew, chief sanitary inspector, dealing with the housing of miners in the northern district of Ayrshire, has been submitted to the Public Health Sub-committee of the District Committee of the county council. The report is a lengthy one, dealing with the parishes of Stevenston, Kilwinning, Irvine, Dreghorn, Dalry, and Kilbirnie, and gives information as to the state of progress of the repairs and improvements instructed to be carried out on the various miners' rows some time ago. On the recommendation of the Public Health Sub-committee it has been agreed that as regards those cases where the proprietors are not proposing to carry out washing houses and coal cellars the opinion of the Local Government Board be obtained, and that proprietors who do not proceed with all necessary repairs, or with part of them, without delay will have legal proceedings taken against them.

Sewerage and Sewage Disposal Appliances.

MANUFACTURERS' REPORTS.

The year 1914 has been one of pronounced activity with the Pulsometer Engineering Company, Limited, in regard to pumping installations in connection with sewerage, and their Stereophagus pump, the construction of which is doubtless well known to our readers, is becoming a great favourite among sewerage engineers. Its simplicity and reliability, together with its extraordinary power of dealing with solids, makes the pump of unequalled value for work of this character.

Among the installations for which pumps have been supplied by this firm might be mentioned the following sewerage or drainage works: Southend-on-Sea, Margate, Evesham, Cannock, Glastonbury, Harpenden, Horbury, Rossington, Wanstead, Whittington and Newbold, Porthcawl, Urmston and Flixton Joint Drainage Batley, Wath-upon-Dearne, Seisdon, Windermere, Whitstable, Petone (N.Z.), Warwick, and Leyton.

* * * *

Messrs Manlove, Alliott & Co., Limited, of Nottingham, have carried out a considerable amount of work in connection with sewage disposal during the past year. At Ipswich they have supplied a sewage ejector plant, consisting of a pair of their automatic pneumatic ejectors. These ejectors are automatic in action, and so arranged that one ejector of each pair is always capable of receiving the inflow of sewage. The arrangement of the ejectors is such that both of them cannot be filling or discharging at the same time. A single ejector has also been supplied to the Ipswich sanatorium. Messrs. Manlove, Alliott & Co., Limited, supplied an ejector to this institution about two years ago, and the one just supplied is a duplicate of the previous one, and is arranged to work in conjunction with it. The ideal arrangement of these ejectors is to instal them in pairs. This permits one to be filling while the other is discharging, and vice versâ, thus providing means for dealing with an uninterrupted flow of sewage. The filter press is a well-known speciality of Messrs. Manlove, Alliott & Co., Limited, and we understand that in this department of their business they have had a busy year. Among the filter presses supplied for dealing with sewage sludge may be mentioned a plant for the urban district council of Ashton-in-Makerfield. This plant consists of two sludge presses, lime mixer, two steel sludge rams, two chain pumps, &c. A further filter press for sludge is being made for the corporation of Ashton-under-Lyne.

* * *

The Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham, report that the steady increase in their business in recent years has been maintained during the past year, especially in the department dealing with sewage disposal appliances, in which the sales during 1914 were more than double those of the previous year. Among the appliances in question may be mentioned rotary and rectangular sprinklers, fixed sprays, intermittent dosing valves, patent tiles, Fieldhouse patent sedimentation tank, power and hand driven screens and sludge elevating apparatus, filtering material washers, and all types of penstocks, valves and floating arms.

* * *

Messrs. Adams-Hydraulics, Limited, report a very successful year, the output having by far exceeded that of any previous year. It is specially gratifying to note that the value of orders received during the last six months of the year is above that of the corresponding six months, notwithstanding the unsettled state of the country in consequence of the war. In every department of their work, whether in sewage purification plant, sewage lifting plant, or general ironwork, a steady and satisfactory increase has been maintained, and the sale of their patent conical manhole covers is far in excess of former years, a fact which conclusively proves that its special features render it wholly unique.

* * *

Messrs. Tangyes, Limited, of Birmingham, have supplied a number of pumps for raising sewage, in particular, their sewage type Tan-Gyro centrifugal pumps. Among others may be mentioned 4-in. pumps of this type for Hartley Wintney (Hants), and Witney (Oxon), two 6-in. pumps for Weedon; one 8-in. pump for Rochdale, and two for Hemsworth; and two 10-in. pumps, each capable of delivering 100,000 gallons per hour, for Banbury. In addition to this, their vertical treble ram pumps have been adopted for raising sewage at Buckingham, Cleethorpes, and Banbury. The pumping plant at Bedford includes one 8-in., two 13-in., and one 15-in. Tanyge centrifugal pumps, while at Faversham they have erected a double-acting vertical ram pump for raising sludge.

* * * *

Messrs. Tuke & Bell, Limited, of Tottenham, report that, notwithstanding the war, which has so seriously affected business throughout the world during the last five months, they are able to report that their volume of business continues steadily to increase, and the advantages of their special apparatus, in connection with sewerage, sewage disposal, water softening, and water filtration, continue to be appreciated by surveyors and civil engineers. They have supplied during the year large numbers of their "Grip" road covers, most of these being repeat orders from councils who have already proved the efficiency of this cover. They have put down a considerable number of ejector and sewage lift installations, and have received repeat orders for these from the York City Council and from the Hayes Urban District Council. Their Pulsator ram system of fixed sprays, which provides a varying pressure and distribution, and a thorough clearing of the jets by means of the instantaneous maximum pressure, have been installed in several places. They have supplied, or have in hand, distributors for Chester, Middleham, Bunbury, Hertford, Beeston, Pateley Bridge, Gayle, Barrasford, Ludworth, Grantham, Colwall, Southborough, Reading, Southam, Gloucester, Cockermouth, Maltby, and other places; and their "Ideal" revolving distributor, which is positive in action, and has no perforations liable to choke, is being increasingly used. They have supplied also the complete apparatus and carried out the constructional work for sewage purification installations for a number of sanatoria, housing schemes, hospitals, industrial schools, agricultural colleges, orphanages and factories, in addition to a large number of mansions and country houses. During the year they have considerably developed their business in water softening apparatus and water filters, and at the present time are very fully occupied, having made large extensions to their works, with extensive contracts for water filters for H.M. War Office.

St. Pancras Municipal Cemetery.—St. Pancras municipal cemetery, the first to be established when the Burial Act closed the old churchyards and crypts some sixty years ago, is now entirely free from debt, the final loan instalment just having been paid. Thousands of pounds profit have been made out of the cemetery, which still has 70 acres of ground available for interments.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

Ayrshire Water Supplies.—At a meeting of Irvine and District Water Board the tender of Messrs. Wilson, Kinnaird & Marr (Limited), Glasgow, to lay a new main pipe from Munnoch reservoir to Greenhead Glen, at a cost of £3,599 was accepted. It was stated that the board had decided to abandon the said reservoir, and it had been agreed to adopt the Paterson system of rapid filters. The board accordingly accepted the quotation of the Paterson Engineering Company (Limited) to provide the new installation at a cost of £13,175, together with an oil engine at £145.

Literature of Municipal Engineering in 1914.

[Any book included in this summary will be forwarded, post free, on application to the St. Bride's Press, Limited, 24 Bride Lane, Fleet Street, London, E.C. The published price must be enclosed.]

In accordance with our usual custom, we publish below a summary of the books dealing with subjects of interest to municipal engineers which have been issued during the past year. In doing so we may, perhaps, direct the attention of our readers to THE SURVEYOR Book Department, through which technical books, issued by various publishers, may be obtained from a single source with the minimum amount of trouble. Orders by post receive careful and prompt attention, and particulars and lists of books on any desired subject may be obtained on application. The references in brackets are to the volume and page of THE SURVEYOR in which a review has appeared.

Annuals and Year-books.

"Studies in Water Supply." By A. C. Houston, D.SC., M.B., C.M., Director of Water Examination, Metropolitan Water Board. Price 5s. nett. London: Macmillan & Co. (Vol. 45, p. 417.)

"The Microscopy of Drinking Water." By G. C. Whipple. Third Edition; rewritten and enlarged. Price 17s. nett. London: Chapman & Hall, Limited. (Vol. 46, p. 243.)

"Transactions of the Institution of Water Engineers." Vol. XVIII. Edited by Percy Griffith, M.INST.C.E., F.G.S., Secretary. London: St. Bride's Press, Limited. (Vol. 46, p. 70.)

"Water Supplies: Their Purification, Filtration and Sterilisation." By Dr. Eric K. Rideal. Price 7s. 6d. nett. London: Crosby Lockwood & Son. (Vol. 46, p. 613.)

"Waterworks Engineering." By Fred. C. Uren, M.INST.C.E., Ireland Silver Medallist in Civil Engineering, engineer and surveyor, Aldershot Urban District Council. Price 10s. 6d. nett. Bristol: Castle Litho., Limited. (Vol. 46, p. 17.)

Pocket-books.

"Spon's Architects' and Builders' Pocket Price-book." Edited by C. Young, F.R.I.B.A., and S. M. Brooks, L.R.I.B.A. Price 2s. 6d. nett. London: E. & F. N. Spon, Limited. (Vol. 45, p. 454.)

"The Inventor's Adviser and Manufacturer's Handbook of Patents, Designs and Trade Marks." Ninth Edition. By Reginald Haddan. Price 5s. London: Harrison & Sons. (Vol. 45, p. 454.)

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

452. Wells. What are (1) A deep well, (2) a shallow well, (3) an artesian well, and (4) an Abyssinian well? Give definitions. (G. C., *Wigston Magna.*)

453. Building Construction.—Draw a section showing the construction of a flat asphalted roof, carried on timber joists 10 in. by 2½ in., ceiled below, the walls to be of 14 in. brickwork, surmounted by a 9-in. parapet, 2 ft. high, coped with stones, the section to run across the joists and through the parapet walls. ("Ajax.")

454. Foundations.—What should be the composition of concrete for the foundations of a factory chimney-stack? Would lime concrete be suitable? (Ajax.)

455. Testing Materials.—Give an outline sketch of a testing machine for tension tests of steel. (Inquirer.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

451. Hydraulics.—Sketch a practical form of hydraulic ram for raising automatically to a considerable height a portion of any volume of water derived from a lesser height, and explain the points upon which satisfactory working depends.

The hydraulic ram is generally arranged as shown in Fig. 1. The water flows from the stream or tank through a cast-iron pipe, usually called the drive pipe, into the ram (Fig. 2), which is a hollow casting containing two clack valves. The first valve is called the escape or dash valve (D.V.), which opens downwards, and the other the check valve (C.V.), which opens upwards. Over the latter is fixed an air vessel (A.V.), having a delivery or rising pipe (R.P.) fixed to it. If the apparatus be airtight, and the dash valve be compressed, the machine will begin to work automatically, and will continue to do so for a long time. At first the water begins to escape at the dash valve, but the acceleration due to gravity in the drive pipe produces greater pressure on it, and it is suddenly raised to its seat; at the same time the kinetic energy which has been imparted to the water lifts the check valve and forces some of the water into the air vessel. When this energy has been spent the pressure of the air

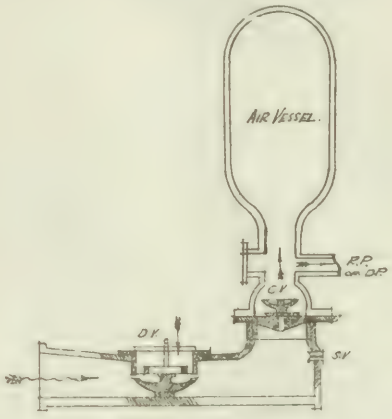

FIG. 2.

and the weight of the check valve cause the latter to close, and immediately the dash valve opens. This series of operations continues automatically, and the air becomes more and more compressed, and gradually forces the water higher and higher up the delivery pipe, until it issues forth as a constant stream from its mouth into the tank or cistern. The air vessel is a very important feature in the machine, as it acts as a cushion and minimises the stress to the casting from "water-hammer," and also acts as a storer of energy, taking up part of the kinetic energy of the water, and giving it out gently, this producing a constant flow through the delivery pipe. The air vessel may be kept charged by a small snifter valve (S.V.) being placed immediately below the check valve. This, in its simplest and most efficient form, con-

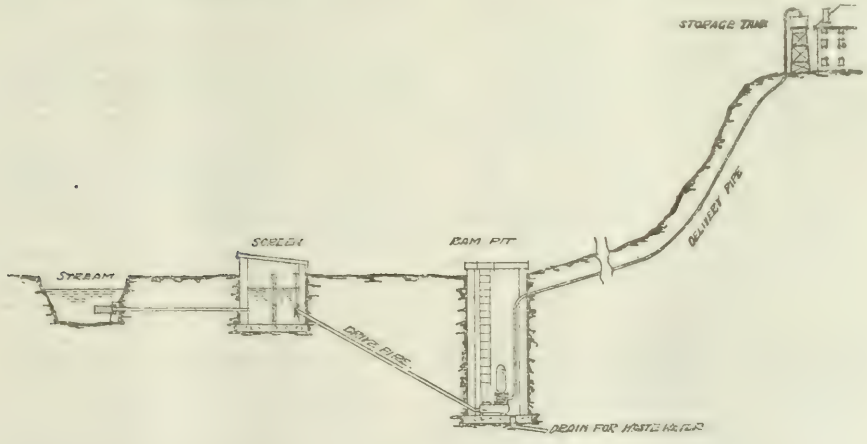

FIG. 1.

sists of a brass plug screwed into the casting, with a very small hole drilled through its axis. Thus every time the water is forced through the check valve a small quantity of air is drawn in, thus keeping the air vessel well supplied. The chief points to be considered for satisfactory working are: (1) The friction of the drive pipe, valves and casting should be as small as possible; (2) the apparatus must be airtight; (3) the valves should be well balanced; (4) the fall from feeding stream or tank to ram should be as much as possible. According to "Molesworth Tables," one-seventh of the water used for driving the ram may be raised to four times the head of the supply, or one-fourteenth to eight times the height, the formula for this being—

$$D = \frac{A \times 4B}{7C}$$

When A = water available for raising
B = vertical height of fall in feet
C = vertical height of delivery in feet
D = quantity raised.

(F. J. M., *Luton.*)

NOTES.

The Specific Gravity and Bushel-weight Tests for Portland Cement.

Specific Gravity.—The determination of the specific gravity of cement is rather difficult, and unless great care is taken the results are liable to be inaccurate. The specific gravity of a powder, like cement, is found by introducing a weighed quantity of the substance into a flask having a known capacity when filled up to a certain mark, and then measuring the volume of liquid necessary to fill the flask up to the mark. In the case of a fine powder the operation is rendered more difficult owing to the tenacious retention of air by the powder, each particle being surrounded by an "atmosphere" of adhering air, and this air is not dislodged at once by immersion in water. It is this that leads to inaccurate results. It is only by very careful shaking and tapping that this air can be made to collect in the form of bubbles and to rise to the surface. Owing to the action of water on cement, it is impossible to use that liquid for the purpose, and its place is taken by paraffin or turpentine, which must be thoroughly dried by standing over quicklime before use. A convenient form of flask for the determination of the specific gravity of cement is shown in Fig. 1. It is broad and flat-bottomed, with a graduated neck. The capacity up

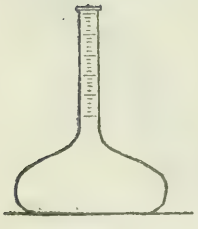

Fig. 1.

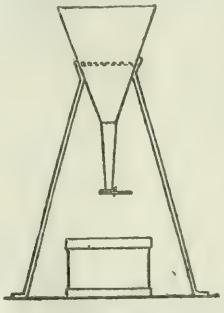

Fig. 2.

to the lowest graduation, which is marked 14, is exactly 64 cubic centimetres. In making a determination 50 cubic centimetres of dry paraffin are introduced by means of a pipette, so as to avoid wetting the neck. Fifty grammes of cement are then weighed out and introduced into the flask through a funnel. After tapping and gently shaking, the level of the liquid meriscus is read off on the graduated neck. The volume of liquid displaced is equal to the volume of cement. All ordinary Portland cements give a reading between 14 and 17 cubic centimetres. The specific gravity is obtained by dividing 50 by the reading, three places of decimals being sufficient accuracy. The practice of introducing the cement first into the flask is not to be recommended, as the air bubbles are much less easily displaced in this way. A minimum value for the specific gravity of Portland cement is usually specified, and in the British Standard Specification it is 3·15 for freshly ground cement and 3·10 for cement known to have been ground at least four weeks. This latter figure is in recognition of the fact that all cements, when exposed to the air, undergo partial hydration and conversion into calcium carbonate at the surface of the particles, which thus become specifically lighter. This combined water and carbon dioxide can be removed by ignition; and it is the practice in some laboratories to make a separate determination of the specific gravity of a sample which has been thoroughly ignited and allowed to cool.

"Bushel-weight" or Apparent Density.—This test at one time generally applied, but has long been deservedly abandoned, as the numerical values obtained were found to be worthless as an indication of the quality of the cement. This was chiefly due to not standardising the conditions. It has been found that the amount of cement that can be put into a bushel measure by vigorous shaking is as much as 70 per cent more than if it is put in as lightly as possible, thus showing the uselessness of the test unless the conditions are standardised. The modern equivalent of the test, which is used in some laboratories, is the "weight per litre," or, as it is sometimes called, "the apparent density" test. A convenient form of apparatus is shown in Fig. 2. The cement is introduced into the conical sheet-metal funnel, which is provided with a perforated disc half way down. The cement is gently stirred, so that it passes through the perforations into a cylindrical brass vessel below, 12·5 centimetres in diameter and 8·15 centimetres high, the capacity of which is one litre. Care should be taken to avoid all shaking of the apparatus during filling. In comparing results, as obtained by this test, it must be borne in mind that the conditions must be identical, otherwise the results are not comparable. The weight of a measured volume of cement determined under standard conditions depends upon the specific gravity and the fineness of grinding, a high specific gravity and a low "litre weight" being a condition indicating fine grinding. (J. A. R., *Faversham.*)

OUR SUFFERING ROADS.

THE EFFECTS OF MILITARY OPERATIONS AND WEATHER.

Military operations and the bad weather combined are laying up in store trouble for the road surveyors in many parts of the United Kingdom. Mechanical transport is by no means alone to blame for the state of the roads in the vicinity of important military camps; thousands of horses are to be found in many counties, and these animals have to be exercised daily. They frequently cannot be exercised on the land, so they are walked or trotted up and down the highways. The extra damage from the tens of thousands of hoofs may easily be noticed by any observant person. More serious, however, than either of the foregoing circumstances of the past few months is the effect of the unprecedentedly rapid temperature variations. Oscillations of temperature have been abnormal of late; the corresponding exceptional contractions and expansions of the road crust have disintegrated metal from binding, and the loose crust under traffic is being damaged to an extent which may, before long, represent a sum running into several million pounds sterling.

We desire (says the *Commercial Motor*) to extend in advance our sympathies to the road surveyors of the United Kingdom for the conditions which lie ahead of them. They are hampered by want of their usual supply of materials, and they are deprived of ordinary resources in regard to labour. They have, furthermore, no redress against the military authorities, who are shielding themselves behind the privileges of the Crown and the funds which are at the disposal of the Road Board. The surveyors have therefore to contemplate the continuance of a period of mental anxiety, knowing full well that the roads in which they take so great a pride are suffering widespread damage by reason of circumstances over which they have no control. Floods in certain areas have added to these anxieties very materially, but we repeat that it is the frequent rapid temperature changes which are likely to prove the worst factor of all. Motorists in this country, who have gradually become accustomed to evidences of steady improvement in road construction and maintenance, will have to look forward, we greatly fear, to a period not only of marking time, but possibly to one of absolute retrogression in respect of surface conditions.

Some Modern Methods of Arch Calculation.*

By EWART S. ANDREWS, B.Sc., M.I.C.E.

The arch is a form of structure which possesses great advantages from the standpoints of beauty and economy, and from the earliest times the arch has been used in all kinds of constructional work. In the present paper arches are not considered at all from the point of view of architectural styles or orders, consideration being restricted to the calculation of the stresses in them.

The arch presents points of considerable difficulty from this point of view, and the resulting formulæ are elaborate. Some may contend that the formulæ are too elaborate, and that "simple practical rules" are just as good. One answer to this contention is that such simple rules would be welcomed if they really were as good. The difficulty is that, unless simple rules are applicable over a wide range, and have been fully tested by scientific experiment, there is considerable danger in their use.

There is, unfortunately, among some practical engineers a strong antipathy to complicated formulæ—an antipathy which is usually stronger in proportion as the formulæ are not understood—but loser acquaintance with such formulæ and some useful spade work in the form of the compilation of tables and diagrams usually helps to dispel much of the dread. The primary reason of the difficulty in the determination of the stresses in arches arises from the fact that in most cases the arch is what is called "a statically 'ndeterminate structure," so that the forces acting upon the arch cannot be found by the ordinary laws of statics. Exactly similar difficulties arise in the case of stiffened suspension bridges, continuous beams, and slabs.

The stresses in an arch can be found as soon as we can find the magnitude and position of the reactions. These reactions R may be considered as compounded of vertical components V and horizontal thrusts H. If, as is usual, all the loads on the arch are vertical, the horizontal thrust H must be the same at each end. We can then draw the line of pressure, linear arch or equilibrium polygon (three alternative names for the same thing) for the given load system upon the arch.

Then, by Eddy's theorem that "the bending moment at any point of an arch is equal to the product of the horizontal thrust into the vertical intercept between the centre line of the arch and the line of pressure," we have—

$$\text{Bending moment at any point P} = \text{H}\,\delta$$

If the line of pressure comes below the centre line of the arch, the upper surface or extrados of the arch will tend to become in tension, and if the line of pressure is above the centre line of the arch, the lower surface, or intrados, of the arch tends to become in tension.

STRESSES IN THE ARCH.

To obtain the stresses in the arch we first find the thrust or normal pressure Q, and the shearing force S, at the point by resolving the thrust O, at the point under consideration along and perpendicular to the centre line of the arch at the given point.

Then, if A is the area of the section, and M_c, M_t the compression and tension moduli, we have—

$$\text{Maximum tension stress} = t = \frac{\text{H}\,\delta}{\text{M}_t} - \frac{\text{Q}}{\text{A}} \quad . \quad (1)$$

$$\text{Maximum compression stress} = c = \frac{\text{H}\,\delta}{\text{M}_c} - \frac{\text{Q}}{\text{A}} \quad . \quad (2)$$

$$\text{Mean shear stress} = s = \frac{\text{S}}{\text{A}} \quad . \quad . \quad (3)$$

There is therefore no difficulty whatever in the calculation of stresses in arches when once we know the horizontal thrust.

Cases in which the horizontal thrust can be found without the elastic theory of arches are as follows:—

(1) Parabolic arch uniformly loaded over whole span—

$$\text{H} = \frac{w\,l^2}{8\,v}$$

w = load per unit length,
l = span of arch,
v = rise of arch.

(2) Parabolic arch with uniform load extending from an abutment to the centre—

$$\text{H} = \frac{w\,l^2}{16\,v}$$

(3) Arch of any shape provided with hinges.—In this case the line of pressure can be drawn by the well-known graphical construction for making a link-polygon pass through any three given points; then the polar distance of the vector diagram gives the horizontal thrust desired.

This theory, to which the author's principal attention was given, is based upon a consideration of the deformations which an arch-rib obeying the ordinary laws of bending will receive. From these deformations we are able to calculate the horizontal thrusts.

Let δs represent a very short length between two points of an arch rib, one end of which is considered as fixed relatively to the other end, and suppose that the bending moment along this very short length is B.

If E is the elastic (Young's modulus), and I the moment of inertia of the rib, it can be shown by the theory of beams that—

Δy = vertical displacement of D due to bending

$$= -\sum \frac{\text{B}\,x\,\delta s}{\text{E}\,\text{I}} \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

Δx = horizontal displacement of D due to bending

$$= -\sum \frac{\text{B}\,y\,\delta s}{\text{E}\,\text{I}} \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

$\Delta \theta$ = angular change of tangent to rib at D

$$= -\sum \frac{\text{B}\,\delta s}{\text{E}\,\text{I}} \quad . \quad . \quad . \quad . \quad . \quad . \quad (3)$$

These are the general formulæ upon which all the special formulæ are based, and it should be noted in passing that they are the deformations due to bending only, and do not include those due to direct thrust. We will refer to the effect of the latter at a later stage.

These general formulæ were then applied to the most common special cases of rigid arches—viz.:—

(1) Arches with two hinges or pin joints—*i.e.*, two-pinned arches.

(2) Arches without hinges—*i.e.*, fixed arches.

In a paper of this kind it was manifestly impossible to deal fully with a subject upon which several long text-books have been written, and it might very well be that many important points have been omitted. The author hoped, however, that a study of the paper would enable those who had not had the opportunity of a complete study of the arch theory in its more general aspects to follow the fundamental relations upon which scientific calculations were based and that their interest would be sufficiently aroused to encourage them to study the subject more fully.

* Abstract of paper read at the last meeting of the Concrete Institute.

Snow Ploughs.—The Patent Snow Plough Company, Mytholmroyd, have recently supplied a number of their 1914 pattern machines to the Government.

Law of Private Street Works.—It is surely a commentary on our system of legislation relating to what may be termed domestic matters that the owner of house property (to say nothing of the occupiers of his houses) has to thread his way through a maze of statutes and decisions to ascertain his rights and his liabilities in connection with questions which may arise every day. Such, however, being the case, text-books dealing with what on the face of them might be deemed to be simple matters have become an actual necessity, although the owner of property is lucky if the text-book suffices and he is not driven to consult a specialist. The work before us* deals with one of such subjects, private street works under the Public Health Acts and the Private Street Works Act, 1882, but not with the Metropolitan Management Acts; the statements in the text are supported by decided cases, with references printed in the text; there is also a table of cases and an index, and it should prove a useful handbook. We find the recent decisions included, and the work seems to have been carefully prepared.—*The Builder.*

* "Notes on the Law of Private Street Works under the Public Health Acts." By J. B. Reignier Conder, a Solicitor of the Supreme Court. 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

SOME RECENT PUBLICATIONS.*

American Handbook for Electrical Engineers. Edited by Harold Pender. Price 21s. nett. London: Chapman & Hall, Limited.

Inasmuch as this encyclopædic work contains upwards of 2,000 pages, it is well that the temptation to call it a "pocket" book has been avoided. An excellent principle which has been observed throughout is the treatment of theoretical principles in separate articles, so that the engineer desirous of looking up a practical point can always find it easily and without wading through a mass of theoretical discussion. Further, although the handbook is primarily devoted to electrotechnics, articles will be found upon those branches of civil and mechanical engineering which are related to electrical practice. The handbook does not profess to be a treatise, but it is much more than a note-book, so that, although many of the articles are necessarily condensed, they are so complete as in every case to render the information given of the greatest practical value. Ease of reference is an important matter in a work of this character, and this is thoroughly secured by the arrangement of the articles in encyclopædic form, and by the adoption of a uniform plan in the subdivision of the articles themselves. Moreover, each article concludes with a bibliography directing the reader to the sources of more extended information. The book is unique in form and arrangement, and its completeness should assure it a permanent place among the recognised standard works of its class.

Text-book of Mechanics. Vol. V.: Hydraulics. By Louis A. Martin, junr. Price 6s.6d. nett. London: Chapman & Hall, Limited.

This is the fifth volume of Mr. Martin's text-book of mechanics, published in New York by Messrs. John Wiley & Sons. It is designed primarily for use in colleges and technical schools, and is concerned with the fundamental principles underlying the science of hydraulics. The first chapter is devoted to a consideration of liquids at rest, and affords a fitting introduction to the main part of the work. The author has throughout kept in view the applications of the theories developed to practical problems. Moreover, the whole work is copiously sprinkled with exercises and problems, which will be much appreciated by students. Special attention is given to the principles underlying the theory and design of impulse wheels and turbines. The student who conscientiously works through this book will have a thorough grasp of the subject.

Foundations. By Malverd A. Horne. Price 5s. 6d. nett. London: Chapman & Hall, Limited.

The author of this book, which is issued in New York by Messrs. John Wiley & Sons, is Professor of Civil Engineering at the Rose Polytechnic Institute, and his object has been to state in an elementary manner the fundamental principles upon which the proper design of foundations is based, and to arrange the matter in a form suitable for a students' text-book. The first chapter deals with the supporting capacity of soils, while subsequent chapters are respectively devoted to wall and column footings, piles and pile foundations, chimneys and towers, bridge piers and abutments, and the methods employed for difficult foundations. Throughout the work the footing courses of the several structures have been treated separately from the foundations proper. The work is well illustrated, the drawings having been selected from descriptions of actual structures.

Pumping by Compressed Air. By Edmund M. Ivens, M.E. Price 12s. 6d. nett. London: Chapman & Hall, Limited.

This work, intended at once for the student and the operating engineer, forms one of Messrs. Wiley's well-known technical series. The literature on the subject is comparatively meagre, the use of compressed air for pumping purposes only having developed to any extent in recent years. In addition to descriptions of plant and explanations of the scientific principles upon which the various kinds are based, the work contains a lucid account of so much hydraulics and thermo-dynamics as is necessary to a complete understanding of the subject. The book should prove of great value to all who are interested in the matters of which it treats.

The Tithe Rent Charge Table. Showing at a glance the yearly and half-yearly values of any tithe rent charge for the year 1915. By P. W. Millard, LL.B. Price 1s. 1d. post free. London: Shaw & Sons.

This is the seventy-ninth annual issue of these well-known tables, and the fact that they are recommended by the Auctioneers' Institute and the Tithe Rent Charge Owners' Union affords sufficient testimony to their usefulness and reliability. In addition to the tables, the book contains a short summary of the complicated provisions of the numerous Tithe Acts. The whole will be found most useful not only to landowners and tithe owners, but also to all professional men who are interested in the subject.

The "Mechanical World" Electrical Pocket-book for 1915. Price 6d. nett. London: Emmott & Co., Limited.

The present issue of this popular handbook is similar in form to its predecessors. Many of the sections, however, have been considerably extended, and several new features have been introduced. Among the latter may be mentioned sections dealing respectively with electric circuits and switching, and alternating current generator, and motor troubles and their remedies. The book generally has been thoroughly revised, and remains a marvel of excellence and cheapness. Reference is facilitated by a very complete index.

In spite of the disturbance of our normal life caused by the struggle in Europe, the Homeland Association is steadily continuing the publication of its books describing the green fields and pleasant by-ways of England, and has recently issued, after being out of print for many years, a handbook to Dorking, Box Hill, and its beautiful surroundings—a peerless gem of Surrey scenery and environment. The book is published in cloth at 1s., and in paper boards at 6d., and contains a plan of the town and a valuable 1-in. Ordnance Survey map of the surrounding country which will appeal to ramblers.

* Any of the publications reviewed or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

PRO PATRIA.

[NINETEENTH LIST.]

We present herewith the nineteenth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Craddock, A. C. B., second assistant engineer, Shanghai Municipal Council, has volunteered for active service.

Evans, T. R., junior assistant, Shanghai Municipal Council, has volunteered for active service.

Gimson, A. F., surveying assistant, Shanghai Municipal Council, has joined the colours.

Gray, A. T., district inspector, Shanghai Municipal Council, has joined the Army.

Hawthorne, G. S., clerk in the office of the Berks medical officer, private, A Company, 4th Battalion Royal Berks, Chelmsford.

Lewis, J., engineer and surveyor to the Yiewsley Urban District Council, and assistant engineer and surveyor to the Uxbridge Rural and Yiewsley Urban Joint Drainage Board, 2nd Reserve Battalion, City of London Sanitary Company, R.A.M.C., has volunteered for foreign service.

Needham, J. E., chief assistant engineer, Shanghai Municipal Council, has joined the colours.

Pollard, H. E., second assistant engineer, Shanghai Municipal Council, has volunteered for active service.

Salkield, T., city engineer of Delhi, Captain, commanding F Company, 1st Punjab Volunteer Rifles, Delhi.

Scougall, A., district inspector, Shanghai Municipal Council, has joined the Army.

Shorto, M. H., second assistant engineer, Shanghai Municipal Council, has volunteered for active service.

Turner, F. O. R., assistant district inspector, Shanghai Municipal Council, has joined the Army.

There was collected in the city engineer's department, Oxford, and paid over to the various war funds up to the end of the year, the sum of £59 5s. 2d.

CORRESPONDENCE.

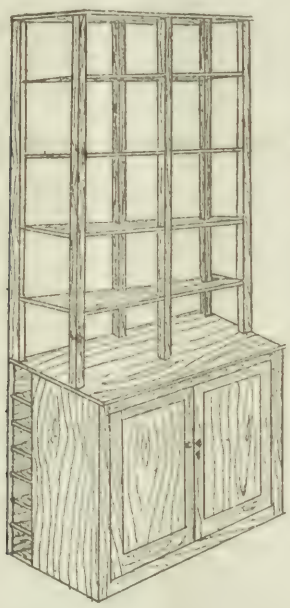
EURIPIDES.

KIT RACK FOR RED CROSS HOSPITALS.

To the Editor of THE SURVEYOR.

SIR, Several readers of THE SURVEYOR have written me relative to a common objection of owners of premises lent as temporary Red Cross hospitals. The provision of a large quantity of shelving is imperative, but ordinary fixing, bearing in mind that the shelves are temporary, has the objection that considerable damage to walls ensues. I now make a practice of specifying shelves to be framed in nests with 2-in. by 2-in. standards back and front, not further than 3 ft. 6 in. apart; shelves to be either wrought board ⅞ in. in thickness, or 2-in. by 1-in.



wrought battens ledgered together. The upper part of the accompanying sketch will illustrate the idea. The drawing shows a kit rack with lock-up cupboard and pigeon-holes at back to take rifles. If the latter are made 6½ in. square, each will contain four rifles—two pushed in from each end. Convenient sizes for the various parts are: Depth of shelves, 18 in.; distance apart, 18 in.; depth of cupboard, 18 in. plus depth of pigeon-holes; width of whole, 4 ft. 6 in.—Yours, &c.,

G. BERTRAM HARTFREE.

Town Hall,
Alton.
January 25, 1914.

MASSACHUSETTS STATE DEPARTMENT OF HEALTH.

To the Editor of THE SURVEYOR.

SIR,—The English engineers who are familiar with the work of the Massachusetts State Board of Health may be interested to learn that this board has recently been reorganised, and henceforth will be known as the Massachusetts State Department of Health. According to the new arrangement there is a Commissioner of Public Health and a council of six appointed by the governor. The commissioner is *ex-officio* a member of this council. The new officials are Dr. Allan J. McLaughlin, Commissioner of Health, and the council is composed of the following: Prof. Wm. T. Sedgwick, Prof. George C. Whipple, Dr. Milton J. Rosenau, Dr. Wm. J. Gallivan, Dr. David L. Edsall, Dr. Joseph E. Lamoreaux.—Yours, &c.,

G. C. WHIPPLE.

Cambridge, Massachusetts.
January 12, 1915.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

What is the name of the engineer who is responsible for the Egyptian roads? Should he not be delighted to read the following paragraph from the Special Finance issue of the *Times* of the 22nd inst.?—

The Main Roads Department, which was formed towards the end of 1912, has, since its inception, made enormous progress in the work of transforming the old tracks into passable roads for vehicular traffic. It is now possible to cross the Delta in all directions by motor-car from town to town. During 1914 about 50 kilometres of roads were constructed. The intention is gradually to macadamise and tar the surface of all roads—at present they are mainly earth surfaces—and the more severely used portions near towns are being so treated first.

* * * *

Does any inhabitant of London ever remember when London streets and roads were left in such a lamentable condition as obtained after the recent snowfall? Is it a fact that this condition was due to the impossibility of finding labour for sweeping and clearing away the snow? And is this not a proof that, instead of there being any distress in London consequent upon unemployment during the war, the reverse is the case, and that there is considerable difficulty in finding sufficient skilled or unskilled labour? What is going to be done with the huge sums of money which have been subscribed to meet distress if none exists?

* * * *

Why are there not used in London more sweeping machines fixed as trailers to quick-running, self-propelled lorries or wagons? Are not all who have watched these machines agreed that they do their work expeditiously and thoroughly, and that the days of the old horse-drawn street-sweeping machine, so far as the Metropolis is concerned, are numbered? Does not one almost wonder when the day will arrive on which improvements and applications of self-propelled traffic will stop? Do not some of us already realise that some day a horse in the streets will be looked upon as a *rara avis*?

* * * *

Have the critics of the condition of the roads in various parts of the country quite realised the enormous difficulties which the road engineers have had to encounter during the past three or four months? Would they be surprised to hear that we have passed through the most trying meteorological times that have been known for years? Do they realise that, in addition to the heaviest rainfall recorded at this season for many years, the sudden changes of temperature have been violent and unprecedented? When we consider the enormous amount of damage caused to roads by quick changes of temperature, and that, in addition to this, there has been abnormal military traffic on most of our roads, should we not be filled with admiration of the men who have risen to the occasion, and have succeeded in keeping our roads from utter destruction?

* * * *

Does not the complaint of the Haslemere surveyor—reported in last week's issue—that he "suffered from being competent," remind one of the story of Napoleon Bonaparte when he rebuked a young and enthusiastic officer with the words, "Trop de zèle, jeune homme, trop de zèle"? Is it not a rather curious coincidence, however, that in the same issue there should have been a short account of a meeting of engineers in America at which Mr. Morris Cooke, director of the Public Works Department of Philadelphia, expressed the view that a municipal engineer should possess the qualification of "a genuine spirit of public service"? Is it not lamentable that, with some municipal authorities, this spirit is looked upon with some disfavour?

* * * *

Who was the learned counsel who, not very long ago, addressed the judge in the following manner with regard to some clause in a well-known Act of Parliament: "My lord, do not hold me responsible for the ignorance of the underpaid departmental official who originally drafted the clause, nor for the overpaid Members of Parliament who, fancying themselves legislators, proceeded to maul the clause in Committee; you and I, my lord, could have done better if the clause had been left to us." Could not this be said of a large number of our Acts of Parlia-

ment, which are often framed with speed and muddled at leisure?

* * * *

Would it not be interesting to know if any of the three bridges which it is proposed to erect over the Thames are to be "toll" bridges, or are they to be free? And what weights will they be designed to carry? Is there not some suspicion that, in the Bill under which powers are to be sought to carry out the work, there are to be inserted clauses which will give the Thames Conservancy Board powers to obtain a revenue from these bridges? If they are not to be free to all classes of traffic, will not the public strongly object to the proposals?

THE SCIENCE OF HEALTH.*

By P. C. Cowan, D.Sc., M.Inst.C.E.,
Chief Engineering Inspector to the Local Government Board for Ireland.

Notwithstanding the great progress made in the sphere of hygiene, especially since the beginning of the Victorian era, it is still necessary to secure, to a much greater extent than hitherto, the individual and personal care of health by the mass of the people. Legislators and sanitarians have already done their part to an extent which might prove sufficient if public opinion were as well informed and zealous as it ought to be with respect to the conservation of the greatest national asset, the good health of the people. That must always largely, if not mainly, depend on the habits and efforts of individuals, and until a widespread interest in sanitation is secured the great code of Public Health and Sanitary Acts will remain to a great extent as dead letters, bringing condemnation instead of deliverance.

For satisfactory civilised life, in addition to the primary essentials of pure air, pure water, and a pure soil, suitable shelter, clothing, and good food are necessary, and should be obtainable by an amount of labour which does not unduly stress the individual. Let us briefly consider how far the conditions of life of the poorer classes in our cities fall short of those moderate requirements.

The general question of the health of towns was investigated by the Poor Law Commissioners of 1839-1842, and they found that the diseases principally prevailing among the working classes were due to accumulations of decomposing refuse, to damp and overcrowded dwellings, and to improper water supply. Yet to-day a very large proportion of the people are housed in slums where the soil and air are necessarily impure on account of the want of space, the impossibility of free access to sunlight and the breeze, the careless habits of the people, and the neglect of scavenging. Whether this is due to poverty, ignorance, or intemperance, or, what is more probable, to all three combined, it is the clear duty of the community to effect a radical improvement. Every adult inhales about 400 cub. ft. of air per twenty-four hours, and sanitary science has clearly shown how vitally important it is that the supply of air should be pure, and how fatal are the effects when it is contaminated. With our modern hygienic knowledge, and especially that part of it relating to the spread of disease by flies or other insects, it is little short of criminal to allow refuse and manure to be stored in our towns, to allow private slaughter-houses, filthy stables and piggeries, and dusty or muddy streets near dwellings.

Our grandfathers could plead that they were ignorant of the vital importance of light and air, but how can we excuse ourselves when we consider the kind of air supply in which the poorer classes in our towns are compelled to exist? They have to breathe a contaminated atmosphere in small rooms of old and decaying buildings, situated in narrow and dirty streets, lanes, and courts, with the soil under and around them permeated and reeking with foul organic matter. In the old quarters of our towns the malign influences of ground air and fluctuations in the level of ground water in a polluted soil are, as a rule, absolutely disregarded. Filth is one of the prime factors in the production and propagation of most of the devastating diseases known to mankind. There are doubtless many unsolved problems regarding the origin and means of communication of disease, but there can be no doubt that cleanliness is a most vital requirement in all our dwellings. . . . There is a crying need for more facilities for the washing of clothes and for bathing among the poor.

Pure air and pure soil cannot be secured where the poor dwell, so long as the sanitary arrangements provided are used by members of more than one family. In one of our great cities, however, a scale of one water-closet to every ten inhabitants over ten years of age is deemed sufficient, and the fact that females cannot possibly use these conveniences is accepted with equanimity. In another city I found a hollow square of about sixteen houses to which a similar number of uncovered ashpits were attached, nearly filling the whole common space behind the houses. Such conditions ought not to be tolerated in any so-called civilised community. The cost of removing them and providing accommodation for all classes where people who wish to live in a cleanly manner can do so will be great, but it must be faced. It would not be a profitless expenditure, but almost certainly, if all the contingent savings are reckoned, quite the contrary. The working classes have been very patient and long-suffering, but they are beginning to voice their social demands. Is their request for the primary necessities of healthy life—a decent shelter, means for keeping themselves clean and healthy, fresh air and sunlight, if not for themselves at least for their children, to be denied them longer?

* Extracts from presidential address to the Engineering and Scientific Association of Scotland.

NOTTS COUNTY SURVEYOR'S RESIGNATION.

The Highways Committee of the Notts County Council on Tuesday last submitted to the council a report recommending the acceptance of the resignation of Mr. E. Purnell Hooley, county surveyor, who, as already stated in The Surveyor, is performing military duties. The committee suggested that Mr. J. C. Haller, the engineering assistant, be appointed to perform the duties of acting county surveyor until the office is filled. The committee further recommended that Mr. Hooley be paid his full salary as county surveyor until he relinquishes the appointment at the expiration of his three months' notice, and that a successor be advertised for at a salary of £750 per year and travelling expenses. [The advertisement appears elsewhere in this issue.]

Colonel H. Denison, in moving the adoption of the report, made allusion to the valuable services rendered by Mr. Hooley in bringing the roads of the county to the highest state of efficiency almost before other counties attempted to improve theirs. They also had to thank him very much indeed for giving Nottinghamshire the benefit of his practical invention of Tarmac without receiving any pecuniary advantage himself so far as this county was concerned. Colonel Denison referred to the enormous expense incurred in consequence of the heavy and fast traction, mentioning that in six months £2,000 damage was done to the roads. As a result of the Tarmac centre, however, a repetition of that trouble had been obviated to a great extent. Mr. Hooley had now joined the 8th Battalion Sherwood Foresters, and, to their regret, was determined to resign, though he expressed his willingness to assist Mr. Haller as much as possible during the ensuing three months.

Mr. C. Mason, in seconding, stated that Mr. Hooley had rendered eminent services to the county during the past twenty-five years, and added that authorities outside Nottinghamshire valued his opinions most highly.

Lord Galway said that Mr. Hooley had accomplished excellent work in connection with the county roads.

Mr. Hooley said he was very grateful to the members of the council for their kindness and help during the past twenty-five years. No one felt the wrench of parting more than he did, but he felt it his duty to do as he had done, and made that his excuse.

Steel Piling for Tanks.—Waterworks and sewerage engineers will be interested in the system of the Side Groove Steel Piling Supply Company, Limited, 16 Water-lane, Great Tower-street, London, E.C., for constructing storage or septic tanks. By the firm's method, the steel piling, instead of timber, is driven to support the sides of the excavation, and, without removal, forms the tank, being rendered on the inside with concrete. The adoption of the system reduces the amount of excavation, and there is no withdrawing of timber shorings, in addition to which no refilling and ramming of the soil around the tank is required.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 57 Moorgate-street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in* BLACK *ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.*

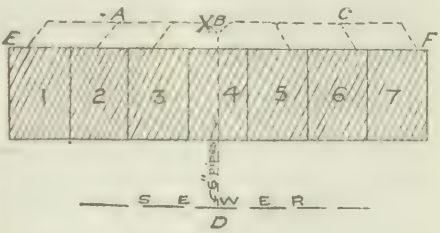
QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as nome de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

WATER SUPPLY WATER FOR TRADE PURPOSES.—"Stoke" writes: In view of the decision in 1913 of *Metropolitan Water Board* v. *Avery*, that a supply to a public-house (even if a large catering business is carried on) is a supply taken for "domestic purposes," and that, in consequence, the supply need not be taken by meter, I should be glad of your opinion in the following cases: (1) Is the decision above binding on all local authorities supplying water? (2) If a stable is attached to the public-house, and a horse and van are kept for delivery purposes, can a meter be then enforced? (3) If a considerable number of horses and conveyances are stabled at a daily charge, can a meter be then enforced? (4) Is water supplied to the following businesses used for "trade purposes": Butcher, where slaughtering is carried on? Baker and confectioner? Factories, where water is used only for cleaning and sanitary purposes? Photographer? Schools? (5) How far can "Regulations" framed by a local authority as to the method of supply, fittings to be used, charges to be made, kind of meters to be used, &c., be legally enforced? Do "Regulations" require confirmation by the Local Government Board, as in the case of building by-laws? The local authority are giving a supply under the Public Health Acts, and have no special private Acts.

(1) The decision referred to was under the Metropolitan Water Board (Charges) Act, 1907, but it would, no doubt, apply to local authorities supplying water under the powers of the Public Health Act, 1875, and the incorporated sections of the Waterworks Clauses Acts, 1847 and 1863. It would also apply to a local authority supplying water under a special Act, unless there was something in that Act which would render the decision inapplicable. The question did not arise in *Metropolitan Water Board* v. *Avery*. But the *ratione decidendi* of that case was that in determining what are "domestic purposes," what has to be looked at is the character of the *purpose* for which the water is used, and not the character of the *premises* in which it is used, and that it is *trade use* of water, and not *increase* caused by the trade use of water, which is put in force by s. 5 of the Act of 1907 outside of domestic purposes. The supply of water to a stable attached to a dwelling-house has been held to be a supply for "domestic purposes" *Bradley* v. *Chesterfield Waterworks Company*, 22 J.P., 689. This case was decided before the passing of the Waterworks Clauses Act, 1863, sec. 12 of which provides that "domestic purposes" shall not include a supply for horses or carriages where they are kept for sale or hire or by a common carrier, or a supply for any trade, manufacture or business. The effect of this section would appear to be that a supply for horses and carriages is a supply for "domestic purposes," except (*a*) where they are kept for sale or hire or by a common carrier, and (*b*) where the circumstances are such that the supply is a supply for a trade, manufacture or business. Applying the principle laid down in *Avery's* case, I think it follows that unless the horse and van are used *solely* for the purpose of the business, the supply would be one for "domestic purposes," and a meter could not be required. (3) If the occupier keeps a horse and carriage which is not used solely for business purposes, he would be entitled to a supply at the domestic rate, and in that case the increased use of water caused by the stabling of horses and conveyances at a daily charge would not, I think, having regard to *Avery's* case, prevent the supply from still being a supply for "domestic purposes." (4) *Butcher.*—The use of water in connection with slaughtering would appear to be an "increase, caused by trade, of domestic use of water," and hence not to be outside "domestic purposes." *Baker and Confectioner.*—The same would, I think, hold good with regard to this business. *Factories.*—A supply to gasworks for sanitary conveniences has been held to be a supply for "domestic purposes" (*South Suburban Gas Company* v. *Metropolitan Water Board*, 1909, 2 Ch., 666); and a supply to a factory for drinking and washing, and closets for the workmen, is a supply for "domestic purposes" (*Colley's Patents, Limited*, v. *Metropolitan Water Board*, 1912, A.C., 24). *Photographer.*—An increase, due to this trade, of the domestic use of water would not prevent the supply from being one for "domestic purposes." *Schools.*—It has been held that the keeping of a boarding school in which water is used for domestic purposes is not carrying on a business for which water is required (*Fredegesilv Bognor Water Company*, 1909, 1 Ch., 149). But a supply of water to a swimming bath at a school is not a supply for "domestic purposes" (*Barnard Castle Urban District Council* v. *Wilson*, 1902, 2 Ch., 746). (5) District councils have no power to make regulations with respect to water supply enforceable by penalties, but they have certain powers under secs. 48, 49, 50, and 54-60 of the Act of 1847, and secs. 16 to 20 of the Act of 1863. The Local Government Board have suggested that councils might draw up "regulations" consisting of an abstract of, or a series of extracts from, these provisions, with a description of the fittings which, in their opinion, would satisfy the requirements of the Acts. No confirmation of such "regulations" by the Local Government Board is necessary, and the board have no power to give such confirmation (Lumley's "Public Health Acts," 8th edition, p. 130).

COMBINED DRAINAGE: SINGLE PRIVATE DRAIN.—"Veras" writes: It is the custom in this city to allow a number of houses to connect to the public sewer by one connection. The enclosed diagram shows seven houses, the drainage from which all discharges by means of the pipes under house No. 4



into the sewer. The pipes taking the drainage of houses Nos. 1 to 3 get choked periodically at the point marked X. All four (1 to 4) belong to different owners. Please say whether these pipes are a sewer or a drain under sec. 19 of the Public Health Acts Amendment Act, 1890, which has been adopted by my council. It is stated that the cause of the trouble is broken pipes, but the council have no proof of this.

I assume that the houses do not all belong to the same owner, otherwise the section does not apply. In *Jackson* v. *Warwick Union Drainage Board* (1904, 2 K.B., 339) sixteen houses were drained by a combined system somewhat similar to that in this case, except that the pipe corresponding with B D on the plan was in a passage between the twelfth and thirteenth house (counting from right to left). The twelve houses to the right of the passage belonged to the plaintiff, the thirteenth house (being the first to the left of the passage) to another owner, and the remaining three houses to a third owner. It was admitted that the pipe at the back of the last four houses—*i.e.*, those to the left of the passage—and the pipe corresponding to B D constituted a "single private drain," these four houses belonging to different owners; but it was held by the Court of Appeal that the pipe at the back of the other twelve houses (all belonging to the plaintiff) was a "sewer." According to this decision, therefore, it would appear that B D would be a "single private drain," and that whether the pipes at the back are "single private drains" or "sewers" would depend upon whether the houses drained by them respectively belong to different owners. But the subsequent decision of the House of Lords in *Wood Green Urban District Council* v. *Joseph* (1907, 1 K.B., 182) has upset all preconceived ideas on this subject, the House having held that sec. 19 of the Act of 1890 applies only to drains which owners can be compelled to provide under sec. 23 or sec. 25 of the Public Health Act, 1875. It seems clear that the local authority could not have compelled the owners to provide either A B C or B D under either of these sections. Therefore it would appear that the whole system (except the portions E A and F C, each of which drains only one house) is a "sewer."

SURVEYOR TO RURAL DISTRICT COUNCIL: REMUNERATION FOR EXTRA SERVICES.—"R. O. S." writes: In this district, as in many others, the roads are being very much damaged by excessive military traffic. I have now received a requisition from the military authorities directing me immediately to repair certain lengths of road, the cost of such repairs to be borne by the Road Board. I have duly forwarded my estimate for the repairs to the Road Board, and have added a certain percentage for supervision and establishment charges, which percentage, I understand, the Road Board are allowing the various councils as extra remuneration for their surveyors owing to the extra work. I am a whole-time officer; my council, however, are anxious for me to undertake the work, and are quite willing to hand over to me the total sum they receive from the Road Board for supervision and establishment charges. As I understand it is illegal

for a surveyor to be paid on percentage on the outlay, would you kindly let me know how the council can overcome the difficulty, it not being possible to fix a certain sum as extra salary, as the amount received from the Road Board will vary according to the amount expended, and in all probability further requisitions for other roads will be received shortly? Would it be possible for the council to pass a resolution that the surveyor's salary be increased by the total amount received from the Road Board for supervision and establishment charges, or would it be necessary, in order to satisfy the auditor, to specify the amount of increase?

The law with respect to the remuneration of surveyors to district councils for extra work is in a very vague and unsatisfactory condition. The only thing that seems certain is that payment by way of percentage on a contract price is illegal by reason of its causing the surveyor to be "interested" in a contract, within the meaning of sec. 193 of the Public Health Act, 1875. The Local Government Board have suggested that the object may be attained by an increase of salary for a specified period; but they have expressed the opinion that the period for which the increase is awarded must be prospective—*i.e.*, it must commence not sooner than the date of the resolution awarding the increase. I am afraid such a resolution as that suggested in the query would not get over the difficulty in this case, as it would probably be held to give the surveyor an "interest" in the contract with the Road Board within the meaning of the Act. I think the only safe plan would be to ascertain the probable amount to be received from the Road Board as nearly as possible, and vote an increase of salary of a specified sum of about that amount in advance. It would also be advisable to obtain the Local Government Board's approval of the proposal beforehand, so as to avoid difficulties with the auditor.

IMPROVEMENT SCHEME: UNHEALTHY AREA.—"Layout" writes: An insanitary area, with other neighbouring lands, are included in an improvement scheme, which is to be executed under the Housing Acts, 1890 (Part I.)—1909. The scheme includes the demolition of slum property, culverting of river, laying out of area with new roads, and erecting working-class dwellings on half the area. In the list of Local Government Board instructions issued in June, 1910, among other particulars required are two copies of the estimate of carrying the scheme into effect. Under sec. 25 of the Housing of the Working Classes Act, 1890, a local authority may borrow money required under the Act; under sub-sec. 4 an urban authority have the same power as given by the Public Health Acts for defraying expenses incurred. (1) Is the estimate to be a detailed one of the complete scheme? (2) Is a definite amount of housing to be included in this estimate when no other houses are available? (3) What is the proportion allowed of those displaced? (4) Has any temporary provision to be made for those displaced at the commencement of the scheme? (5) Does the confirming order give the authority borrowing powers for the amount included in the scheme, or has the authority to apply again separately for sanction to borrow, as the various works are proposed to be executed? (6) Is separate sanction only required in case of additions to the confirmed scheme not elaborated in the latter? (7) Are the plans of the scheme to be complete working drawings as proposed to be carried out, or on the lines of those prepared for a Provisional Order confirmed by Parliament?

(1) Presumably the estimate should give such details as may be necessary to show how it is arrived at. (2, 3 and 4) Neither the Act nor the rules give these particulars. Apparently it is left to the local authority to provide for them in the scheme, or in such manner as they think advisable, and the Local Government Board have power under sec. 8 (5) of the Act of 1890 to make such modifications in the scheme as they think fit. (5 and 6) There does not appear to be any provision for the consent of the Local Government Board to the exercise of borrowing powers being included in the Confirmation Order. Presumably a separate application has to be made for such consent. (7) As the rules do not specifically state that complete working drawings must be furnished, it may, I think, be inferred that they are not necessary.

DAMAGE BY FLOODING.—"L. C." writes: A rural district council have sewered a village within their area, and excluded surface water from the system. Some twelve months ago a house which connected to the main sewer was flooded at the back owing to a large amount of surface water finding its way into the sewers and rendering these incapable of doing their work. The circumstances were investigated, and it was found that the overflow from a large pond was running down to the back of some cottages, and getting into the sewer by the gully traps and manholes; also another block of cottage gardens were being flooded from surface water coming off the high land adjoining. This water was getting to the sewers by means of manhole covers. The rural district council requested the owner of the pond and the high land adjoining the above-mentioned cottages to abate the flooding of the sewers. He complied in the case of the pond by putting in a relief overflow drain, and in the second case by laying a surface-water drain to try and divert water from the high land. No nuisance has since been experienced until a few days ago, when the same house was badly flooded, and damage done to contents of the rooms. It appears that the owner of the pond had instructed his tenant to cleanse it, and the water had been drawn off by means of a hatch. This had been left open, and during a heavy rain the whole of the water had gone through the hatch down the same course as it formerly did before the overflow drain was put in. Hence the same flooding took place. It was also found that water from the high land abutting the second lot of cottages had again flooded the gardens, and had got into the sewers. (1) Is the owner of the pond liable for any damage done in flooded houses? (2) Or is the local authority liable as the sanitary authority? (3) If the tenant claims, should he proceed against the local authority or the owner of the pond?

Assuming that this is a natural pond, and that the landowner has not used the pond or the land in any exceptional or extraordinary manner calculated to cause flooding, and that there has been no negligence on his part, he is not liable, in my opinion, for the damage. Neither, I think, is the local authority liable, in the absence of any negligence on their part.

WATER SUPPLY: MAINS IN NEW STREETS: EXTRAORDINARY TRAFFIC.—"Ravensbury" writes: (1) A new building estate has been developed in an urban district for the erection of workmen's cottages, certain new roads having been laid out on the estate. The local authority who own the waterworks have an existing water main in the public highway at the commencement of the new roads. The society who are building the cottages have applied to the council for a supply of water, and are of opinion that it is the duty of the authority to lay the necessary mains in the new roads, and at the expense of the ratepayers. I should be glad if you would inform me if the council are liable to do this work, or if the laying of the water mains on the new building estate devolves upon the person laying out such estate. (2) The haulage of bricks for the erection of the cottages has been by tractor, and considerable damage has been done to a lane which has recently, by the laying out of new streets, become a thoroughfare. The tractor traffic in connection with the haulage of these bricks is out of all proportion to the usual amount of tractor traffic carried by the lane. The society contend that, in so far as this was not through traffic, they are not liable for damage done to the highway.

(1) There appears to be nothing in the Public Health Act, 1875, or in the Waterworks Clauses Acts, which obliges the council to lay mains in any particular street or streets. A water company or authority whose special Act incorporates the Waterworks Clauses Act, 1847, can be compelled, under sec. 35 of that Act, to lay down mains in every part of their district if the water rates will not be less than one-tenth of the cost. But this section is not incorporated in the Public Health Act, and therefore does not apply to local authorities supplying water under the powers given by that Act. The cost of works necessary to furnish a supply to houses can be recovered from the owners, or declared to be private improvement expenses, under sec. 62 of the Public Health Act, subject to the conditions mentioned in that section. This provision applies apparently whether mains have been laid in the street or not; but if required to obtain a supply from an unreasonable distance the owners would have a right of appeal to the Local Government Board. *West Lancashire Rural District Council* v. *Ogilvy*, 1899, 1 Q.B., 377). (2) I think there can be no doubt that this is "extraordinary traffic," and I do not appreciate the society's contention. The parties "by or in consequence of whose order" the traffic was conducted would, in my opinion, be liable for expenses incurred by reason of the damage arising from the traffic.

BUILDING LINE. "Snowdon" writes: "Some time ago my council passed plans for the erection of four cottages on a site then occupied by a similar number of very dilapidated ones. The building line was defined some 10 ft. back from the front wall of the then existing cottages, this being the line of the buildings immediately above. The owners offered to throw this land into the street if the council would make up the roadway and put a footpath along the frontage. This was agreed to by letter, but no actual agreement was signed. The cottages are now being completed. The floor line has been set some considerable height above the street, and the construction is such that a step outside the building line is necessary. No such step was shown on the deposited plans. This the council will not allow, and the owners have been so informed. Their reply has been a refusal to give up the land, and they are utilising the old cottage walls to enclose the site, and propose to obtain access by means of a sloping path from the street across this area, steps being

The Surveyor
And Municipal and County Engineer.

formed in the centre line wall of Can the Co. be [illegible] the land be extended? (2) It not, can the council right in contracting that the old cottage walls now being used to enclose the site and the [illegible] thereon are to be [illegible] the new cottages and that the erection and building forward beyond the defined building line is an offence against sec. 3 of the Public Health (Building in Streets) Act, 1888.

(1) This depends upon whether the correspondence is such as to amount to a binding contract for the purchase of the land by the council, and the question cannot be satisfactorily answered without seeing a copy of the correspondence. (2) The Act of 1888 is to be construed as one with the Public Health Act, 1875, and sec. 150 of the latter Act provides *inter alia* that the re-erecting of any building pulled down to or below the ground floor shall be considered as the erection of a new building. If, therefore, the cottages have been pulled down to or below the ground floor, the re-erection of their front main wall beyond the front main wall of the house or building on either side thereof, in the same street, without the consent of the council, would be a contravention of sec. 3 of the Act of 1888.

ACCIDENT TO SANITARY INSPECTOR.—"W. J." writes: A is a sanitary inspector to a rural district council, and is paid £200 per annum. He has to provide his own means of locomotion (no special method suggested by the council), and uses a motor cycle. He is insured by the council. While travelling to a village for the purpose of disinfecting a room he overtook two cyclists, who, as it turned out, were not efficient riders. As he was almost on the point of passing them one of them swerved, and in trying to avoid a collision A ran into a wall, injuring himself and the machine. After being in the doctor's hands about three weeks an operation was suggested, and it was evident that it would be some time before [illegible] is not entitled to full salary. Are the council justified [illegible] but the question of additional assistance had already [illegible] give enough time to inspection under the Housing and [illegible] Act, and proposed [illegible] council that the assistant would ride a cycle, but, [illegible] they have authorised the hiring of a motor cycle for long journeys. A's motor cycle is his own property.

In my opinion the council are liable to pay a full salary [illegible] to sue for the salary when due.

[illegible] "G. W." writes: I am forwarding a copy of my council's building by-laws, and would be very pleased to have your opinion as to whether the construction of party gable walls in domestic dwellings with cavity concrete blocks, is permissible or not; also what would be a sound objection to the construction of the said party walls with concrete blocks having a 2-in. cavity?

[illegible] structed of hollow blocks of cement concrete, subject to the [illegible] (including cavity) to be not less than 9 in., substance at [illegible] with [illegible]

Sec. 150 of the Public Health Act, 1875, provides that the [illegible] ground floor shall be considered the erection of a new [illegible] of a new [illegible] rebuilding of the cottage is the erection of a new building, within the meaning of the by-laws, and that plans must be submitted.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

County Councils and Hospitals. Speaking at a meeting of the Executive Council of the County Councils Association held at the Westminster Guildhall on Wednesday, Mr. Herbert Samuel, President of the Local Government Board, said [illegible] that in the near future the trend of legislation would be to give county councils larger powers with respect to the provision of hospital accommodation.

The War and Rural Housing.—Some rural districts who had undertaken housing schemes have been constrained to postpone them because of the feeling of uncertainty created by the war, combined with the rise in the rate of interest on loans and the increased cost of building. The Rural Housing Association, of which Sir Thomas Dyke Acland is president, has addressed to district councils a circular urging them not to pursue the [illegible] delay.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Birmingham T.C. (January 14th. Mr. M. K. North).—£2,190 for the purchase of property at the corner of Bristol-street and Great Colmore-street, for the purposes of a police station.—The town clerk, Mr. E. V. Hiley, stated that four houses stood on the site, and it was not proposed at present to construct a new police station, but to alter some of the rooms of the existing houses to render them suitable for the use of an inspector and to provide quarters for a few single men; also to construct two or three cells for the temporary accommodation of prisoners.

Chesterfield T.C. (January 26th. Mr. W. O. E. Meade-King).—£7,020 for the purpose of carrying out a sanitary conversion scheme.—It was stated that of the 3,724 middens in the borough, 916 had been dealt with by the corporation at the expense of the owners, leaving 2,808 to be dealt with. It was computed that on an average each conversion would cost £5, and the owners would be called upon under the Public Health Act to pay half the cost. The scheme was to be completed by March 21, 1920.

Hursley R.D.C. (January 13th. Mr. F. O. Stanford).—This was an inquiry into the application of the council to put into force the Land Clauses Act in regard to the purchase of land needed as an outfall site for the drainage of Chandler's Ford. The land in question, situate not far from the isolation hospital, is owned by Mr. J. E. Willis Fleming, the tenant being Mr. J. R. G. Fowle. It was stated that an inquiry had been held previously into the proposed drainage scheme, which the council were requested to proceed with. The various owners agreed concerning the notices served on them, but the council were unable to obtain by private treaty the land owned by Mr. Fleming, and required by the council for drainage purposes. Hence the proposal to put into force the Land Clauses Act in regard to it. The engineer for the scheme, Mr. A. H. Brain, stated that he had examined other sites in the village, but none were so suitable for outfall works as the one proposed, this being the only site where part of the district could be drained by gravitation.

Kidderminster T.C. (January 21st. Mr. F. O. Stanford). £31,000 for works of sewerage and sewage disposal.—The town clerk, Mr. J. H. Thorfield, stated that £7,765 was required for sewering the areas recently added to the borough, £6,000 for new pumping plant, and the remainder for storm water tanks, rising main, sedimentation tanks, and under-drainage on the farm. The Local Government Board had assented to a loan of £13,500 for the purchase of additional land at the farm, and that purchase had been completed. It was agreed with the Worcestershire County Council, when Kidderminster Borough was extended, that certain land on the farm should not be used for irrigation purposes in order to minimise any nuisance to Stourport, and that sedimentation tanks should be put on the farm, and it was to carry out this agreement that the present proposal was made. At the request of the Local Government Board the engineer to the corporation, Messrs. Willcox & Raikes, had reported upon the alternatives of treating the sewage bacteriologically or by broad irrigation, and, while reporting that either system could be adopted, advised [illegible] on the land method. The [illegible] was adopted by the corporation.

Maldens and Coombe U.D.C. (January 22nd. Mr. M. K. North). £13,000 for the making up of part of South Lane, under the Private Street Works Act, and £6,000 for the compulsory purchase of certain property.—Mr. R. H. Jeffes, the surveyor to the council, explained the plans. There was considerable opposition to the former scheme, one of the chief frontagers being represented by [illegible] (Mr. Barrington Ward) and by the surveyor (Mr. T. R. Terry).

Manchester T.C. (January 26th. Mr. F. H. Tulloch). £14,570 for private street improvements.—The scheme referred to proposed to make up roads on the southern side of the city. The Parks Committee have announced their intention to plant trees on the footpaths on [illegible] when the proposed improvements have been made.

Newry T.C. (January 12th. Dr. J. McCormack). £400 for the erection of an isolation hospital at Reach Island, Fathom, on the shores of Carlingford Lough.—There was strong opposition to the scheme on behalf of the local oyster fishermen and oyster-bed owners.

Preston T.C. (January 15th. Mr. F. H. Tulloch). —£3,800 for the provision of a park and recreation ground near Newhall-lane, Preston.—It was stated that a portion of the ground it was proposed to purchase had been used as a recreation ground since 1902. This land, amounting to over 9 acres, had been leased to the corporation at a rent of £50, with an option of purchase. The corporation proposed to extend it by the purchase of an adjoining piece of land, and the money they sought to borrow would be expended as follows: Purchase of present ground, £1,940; additional land, £1,160; and laying out of the land, to include two bowling greens and bowl house, £700. The borough surveyor, Mr. T. Cookson, submitted details of the proposed works.

Skelmersdale U.D.C. (January 22nd. Mr. R. S. Maxwell).—This was an inquiry with respect to an application for a Provisional Order to enable the council to borrow money for sewerage and sewage disposal works on the security of bonds valued at £17,500 in the Southport, Birkdale, and West Lancashire Water Board.—The clerk to the council, Mr. A. Dickinson, said that some years ago the council's waterworks undertaking was sold to the water board for the sum of £22,500, £5,000 of which was paid over to the council, and the sum of £17,500 was invested in the bonds of the water board, and was so secured that they were only redeemable at the expiration of a period of thirty years. By Act of Parliament the council were prevented from raising money on the security of these bonds, and a Provisional Order was necessary to enable them to do so, the council requiring the sum of £12,200 to carry out a proposed sewerage scheme. The council were entirely free from debt. At the close of the inquiry the inspector congratulated the township of Skelmersdale on the unique position of having no loans and being free from debt, and also stated that they were exceedingly fortunate in having such a large amount of money (£17,500) in hand. He knew of no other township in such a happy position.

Tipperary U.D.C. (January 12th. Mr. G. B. Deane).—£23,000 for the erection of 129 working-class houses. Opposition was offered in the case of the sites on the Barrymore estate.

APPLICATIONS FOR LOANS.

Ashton T.C. £20,000 for a new secondary school.

Bromley T.C. £937 for road widening.

Bedwas and Machen U.D.C.—£2,150 for water mains extensions.

Cleethorpes U.D.C. £3,800 for street widenings.

Clitheroe T.C. £1,700 for the purpose of a new school.

Hayes U.D.C. £17,000 for a housing scheme.

Holland C.C. £7,000 for hospital extension.

Newquay U.D.C.—£1,900 for sewerage works.

Southend T.C.—£5,158 for private street works.

Tralee U.D.C.—£20,000 for the provision of working-class houses.

Winchcombe R.D.C. £12,867 for a water supply to six districts.

Youghal No. 2 R.D.C. £3,000 for the erection of houses.

LOANS SANCTIONED.

Brighton T.C. £1,000 for laying out a playing field.

Bury T.C. £1,500 for road widening and improvement.

Chester-le-Street R.D.C.—£1,820 for private street works.

Cockermouth R.D.C. £2,100 for works of sewerage and sewage disposal.

Ealing T.C. £3,318 for workmen's houses.

Harwich T.C. £2,110 for street improvement works.

High Wycombe T.C. £1,000 for the provision of a technical institute.

Hoylake and West Kirby U.D.C.—£600 for levelling the West Kirby park.

Knaresborough R.D.C.—£730 for private street works.

Mirfield U.D.C.—£557 for the purposes of the depots.

Newmarket R.D.C.—£500 for experimental works of water supply at Soham.

Paignton U.D.C.—£968 for sewer extensions.

St. Helens T.C.—£7,430 for granite setts and paving works.

FORTHCOMING INQUIRIES.

FEBRUARY.	£
1.—**Hartismere.** For the purposes of housing schemes (Mr. H. A. Chapman)	2,250
1. **Islington.** For the provision of a public convenience (Mr. E. H. Tulloch)	450
2. **Burnley.** For sewage disposal works (Mr. F. O. Stanfield)	1,200
2. **Chapel-en-le-Frith.** For works of sewerage (Mr. R. G. Hetherington)	2,000
2. **Gosforth.** For the provision of a recreation ground (Mr. Edgar Dudley)	1,750
2. **Newport (I.W.).** For the provision of pumping plant (Mr. A. W. Brightmore)	2,000
2. **Redditch.** For the electricity undertaking (Mr. H. R. Hooper)	28,000
2. **Saxmundham.** For the purposes of a hydrant section (Mr. R. H. Beckwith)	363
2.—**Wath-upon-Dearne.** For the purposes of street improvement (Mr. M. K. Nordly)	—
2. **Westminster.** For the purposes of an asylum (Major J. Stewart)	33,500
3. **Hastings.** For the provision of pumping plant (Mr. A. W. Brightmore)	1,295
3. **Kiveton Park.** For works of sewage disposal (Mr. R. G. Hetherington)	—
3. **Walthamstow.** For the electricity undertaking (Major J. Stewart)	11,000
3. **Worcester.** For the electricity undertaking (Mr. H. R. Hooper)	10,3
3. **Worksop.** For sewer and sewage works (Mr. M. K. Nordly)	2,300
4.—**Bradford.** For the purposes of a museum and granite setts paving (Mr. R. G. Hetherington)	9,291
4. **Sheffield.** For the purposes of a [illegible] chapel, heating gas and gilt [illegible] (Mr. M. K. Nordly)	17,300
4. **Swansea.** For works of sewage disposal (Major C. E. Nowell)	331,891
4. **Wandsworth.** For [illegible] library [illegible] (Major J. St. Lyon)	1,200
5. **Barnes.** For the erection of workmen's dwellings (Mr. H. V. Chapman)	7,700
5. **Bridlington.** For the purposes of [illegible] Street (Mr. Edgar Dudley)	300
Leeds. For the erection of a sewage pumping station (Mr. R. G. Hetherington)	1,630
5. **Penistone.** For the purposes of water supply (Mr. L. G. S. Outhwaite)	1,000
5.—**Tonbridge.** For the construction of a promenade (Mr. A. W. Brightmore)	1,000

Electrical Engineers and the War.—Over 700 members of the Institution of Electrical Engineers are serving in the Army and the Navy, chiefly in the Royal Engineers and the Electrical Staff of the Royal Naval Division, but considerable numbers have also joined other branches of the military forces.

Crushed Flints on Kingston Roads. The Automobile Association has written to the Kingston-on-Thames Town Council respecting crushed flints being placed on the highways in frosty weather, and the surveyor has been instructed to make enquiries as to the suitability of other material for the purposes.

Constantinople's Firemen. Lecturing at the London Camera Club on his recent experiences in Constantinople, Dr. T. Cato Worsley said that [illegible] being in witness of the Turkish capital was a house on fire. The first fire engine to arrive was something like a safe, and carried on poles by men, who proceeded first to drive a bargain with the owner of the property. A second brigade then arrived, and began to pull down the adjoining houses, reframing from quenching the fire until the price was agreed upon. Then came a third brigade, which devoted itself to preventing the other two brigades from looting what the flames had not destroyed.

PUBLIC LIGHTING IN FROME URBAN DISTRICT.

The greater part of the street lighting in the urban district of Frome is done by electricity. According to the last annual report of the surveyor, Mr. F. W. Jones, Assoc.M.Inst.C.E., there are ten arc lamps each of 1,000-candle power, and 262 metallic filament lamps, each of 50-candle power. The standards of the arc lamps are each fitted with two 50-candle power lamps which are switched on when the arcs are switched off, and, in addition, forty-five 80-candle power lamps are allowed to burn all night at points where the lights are most needed.

The sums per lamp paid for lighting are as follows: Arcs, £17; ordinary lamps, £2 15s.; all-night lamps, £2 16s. 2d. [illegible] all-night lamps at 9s. 1d.

The cost paid to the electricity department for light for the year ended March 31st last was £922 8s. 7d.

The electricity department is in the hands of Messrs. Edmundson, of Westminster, who installed the undertaking for the council, and who have undertaken to pay all loan charges incurred by the council. The payment of water will expire on September 11, 1920.

The actual sum expended upon the scheme up to the time when it was handed over to Messrs. Edmundson's firm was £43,508. The balance outstanding at the last accounts is £33,010 1s. 7d., which is being paid off at the rate of £2,767 4s. 6d. per annum.

By the agreement entered into by the council and Messrs. Edmundsons the council agree to take current [illegible] lighting until 1925.

FIRE TESTS OF "CALNO" BOARDS.

The Fibrous Plaster Building Boards, Limited, 26 Hart-street, London, W.C., recently submitted for test by the British Fire Prevention Committee a [illegible] "Calno" boards 2 ft. 6 in. in the knee, [illegible] which the latter have been classified under the "Universal Standards" as affording "Temporary Protection (Class A)." This classification is [illegible] entitling partitioning erected after the committee's official test of forty-five minutes' duration to [illegible] resisting a hose stream from a fire engine for two minutes. The maximum [illegible] Fahr. The full record of the test is published in "Red Book" No. 192. The slab of partitioning material under test was placed in a brick opening measuring 3 ft. 9 in. by 2 ft. [illegible] "Calno" boards of ¼ in. in thickness, tested by the committee for the purpose of ascertaining the resistance of the material to fire only, with food a [illegible] The average [illegible] above 1,157 deg. Fahr. The material [illegible] water test under the "Universal Standards" for the purposes of obtaining classification. The full record of the test is published in "Red Book" No. 192. The slab of partitioning material under test was placed in a brick opening measuring 3 ft. 9 in. by 2 ft.

The Reinstatement of Trenches.—Charges for the reinstatement of trenches opened in Kingston-on-Thames are [illegible] to be based on the schedule of the Metropolitan Water Board, the work to be done by the engineer of the corporation.

Shanghai Municipal Employees and the War.—The Municipal Council which controls the cosmopolitan [illegible] has decided that British employees who volunteer for the war will be reinstated if they rejoin the service within six months of the termination of hostilities.

Welsh Rural Housing.—In the course of the last meeting of the Carmarthenshire County Council a letter was read from a man in one of the country districts complaining that he had been turned out of his house because of its state of repair, and asking whether the council intended building cottages for poor people. Mr. Wm. Thomas said the rumour had to be cleared out. "Dogs, goats and pigs," he said "were living with them in the house." Mr. Nathan Griffiths said he knew of farmhouses in a certain district where "the cocks roosted on the bedstead, and the pigs made habitation in the kitchen."

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works on which particulars appear below: Buildings—Llanelly, Middlesex, Newport; roads and materials—Chapel-en-le-Frith, Easington; sewerage and sewage disposal—Ammanford, Chapel-en-le-Frith, Woking; water, gas and electricity—Ashington, Bridgwater, Easingwold, Islington, Nottingham, Skipton.—Particulars of other projected works will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Barnes U.D.C.—The surveyor, Mr. G. Bruce Tomes, has prepared estimates of the cost of the proposed subway at Sheen lane, plans of which were submitted to the council two months ago. He has submitted them to the chief engineer of the London and South-Western Railway Company, together with plans and sections of the proposal. While awaiting the report of the company's engineer, the surveyor is putting forward the scheme for dealing with the White Hart-lane crossing.

Cleethorpes U.D.C.—The Pleasure Grounds Committee have adopted a scheme for the erection of a bandstand at Sidney Park, at an estimated cost of £270.

Golligher U.D.C. Negotiations are proceeding for the purchase of a site for a fire station at Bedlinog.

Grimsby B.B.C. The question of erecting new offices is under consideration.

Lees U.D.C. A scheme has been approved for the erection of stables and the purchase of horses and carts.

Llanelly T.C.—Plans are being considered for the improvement of the north entrance to the market, at a cost not exceeding £6,000.

Middlesex C.C. Plans have been approved of a new school at Pinner, estimated to cost £9,650.

Newport (Mon.) T.C.—The Parliamentary Committee have decided to call in another expert to advise and report on the question of the new bridge.

Sleaford R.D.C.—It has been agreed to purchase premises for the purpose of conversion into council offices. The estimated cost of the scheme is £1,076.

Slough U.D.C.—It has been agreed to erect a public convenience near the council offices in William-street at a cost not exceeding £1,200.

Yarmouth T.C.—In connection with the scheme for public baths in the Beach Gardens, the borough surveyor, Mr. J. W. Cockrill, has received instructions to obtain the necessary materials, at a cost of £1,500.

HOUSING AND TOWN PLANNING.

St. Dogmells R.D.C.—The architect, Mr. J. T. J. Williams, has received instructions to prepare plans for a housing scheme.

Selby U.D.C. The Local Government Board have approved plans for a housing scheme.

Wortley R.D.C.—The council have under consideration a town planning scheme for the Wadsley Bridge and Birley Carr area.

REFUSE COLLECTION AND DISPOSAL.

Kensington B.C. It has been decided to purchase a second "Lilly" [illegible] machine at a cost of £698. The Works Committee report that the one purchased in August has been doing the work of four or five horses. It has travelled an estimated distance of 5,000 miles, and the consumption of fuel has been at the rate of 11·8 miles per gallon.

ROADS AND MATERIALS.

Aberavon B.C. The council decided to [illegible] the [illegible] of a new road between Llewellyn and New Orchard, which is intended to serve as a link between the Aberavon Pottery and New Orchard. The clerk read a communication from the Board of Trade intimating that the Road Board were prepared to increase their contribution towards the expenditure from £50 to £100, and the county council desired to know if the corporation the district council was prepared to make. After considering the subject the council decided to postpone action until after the present crisis.

Chapel-en-le-Frith R.D.C.—The council have under consideration a scheme for the construction of a new road from Whaley Bridge to Bugsworth, the estimated cost of which is £7,000. In this scheme, which has been prepared by the engineers, Messrs. Brady & Partington, Chapel-en-le-Frith, and Mr. E. J. Hunter, the council's surveyor, bridges will be required over the Great Central Railway Canal and the river Goyt.

Croydon R.D.C.—An amended plan for making up Brambledown-road, at an estimated cost of £883, has been prepared by the surveyor, Mr. R. Chart.

Easington R.D.C.—A deputation has been nominated to interview the county council on the subject of the proposed new road at Trimdon. The estimated cost of the scheme is £3,600.

East Grinstead U.D.C.—The council have approved plans for making up Warren-road, at an estimated cost of £468.

Egham U.D.C.—The surveyor, Mr. W. Menzies, has received instructions to resurface the asphalt footpaths in Station-road and Avenue-road, at an estimated cost of £130.

Exeter T.C.—The Streets Committee have approved a scheme for widening Pinhoe-road, at an estimated cost of £777.

Harwich T.C.—Work is to be put in hand for the widening of London-road, at an estimated cost of £1,650.

Leek U.D.C.—The Local Government Board have sanctioned a scheme for the construction of new streets [illegible].

Rutland C.C. The council have decided to make application to the Road Board for a [illegible] Oakham.

Staffs C.C.—It has been agreed to divert and widen the Great Bridgeford and Woodseaves main road near Gamesley Brook, at an estimated cost of £780.

Wrexham T.C.—The council on Tuesday resolved to pave Bradley-road with granite setts, at an estimated cost of £1,629, towards which the Road Board has made a grant of £500.

Youghal No. 1 R.D.C.—The council have agreed to the scheme of the county surveyor to relay with asphalt the road over Youghal Bridge on the main road to Dungarvan, at an estimated cost of £650.

SEWERAGE AND SEWAGE DISPOSAL.

Ammanford U.D.C.—The council have deposited a Bill for introduction into Parliament next Session. The main purpose of this Bill is to give effect to the powers conferred upon the Amman Valley Joint Sewerage Board, which was formed last year by a Local Government Board Order, for the purpose of constructing a [illegible] for receiving and disposing of the drainage of, among other districts, the Amman Valley drainage areas. By the first eight clauses of the Bill the district council ask for powers to lay down fifty-four lines of pipes for connecting the various streets, &c., of their district with the main, to be constructed by the Joint Sewerage Board. The cost of these works, including the purchase of the necessary lands, is estimated at £18,650.

Bishop's Stortford U.D.C.—A proposition to postpone the work having been defeated, notice of motion has been given that the council proceed with the Hockerill sewerage scheme.

Chapel-en-le-Frith R.D.C.—A scheme is in preparation for submission to the Local Government Board for a joint sewerage scheme and sewage disposal works for Bamford and Thornhill, estimated to cost £7,000.

Chorleywood U.D.C.—With respect to a proposal to make up certain roads, the chairman of the Sanitary Committee, Mr. Hodges, with the surveyor, Mr. W. H. Scott, and the clerk, had an interview with an officer of the Local Government Board, who made it quite clear that the board could not see their way to sanction a loan for the purpose of making up roads unless a soil sewer was put in at the same time. Mr. Hodges stated that the committee had considered it might be

a drag-cut, and to take up a sewage chamber on the district had been reported on, and that the pipes might not be up for the season which an expert when called in, would wish. After a good deal of discussion the official suggested three alternatives—viz., making the present storm-water drain the soil sewer later on, making a separate trench for both lines of pipes, or putting in a soil sewer at the same time, but below the storm water drain. He strongly urged the last-mentioned as the best and cheapest course in the long run for the ratepayers. The council, having discussed the matter, decided that an expert should be called in immediately to advise on the system of drainage.

Crompton U.D.C.—Plans have been approved for the proposed extensions to the sewage disposal works. The estimated cost, £2,200, is made up as follows: Detritus tanks, £153; storm-water tanks, £327; precipitation tanks, £187; manholes, £86; [illegible] £896; [illegible] £111.

Lochgelly (Forfar) T.C.—Some of the difficulties incidental to sewage disposal schemes were alluded to at the council meeting recently when the proposed construction of [illegible] was under consideration. It was stated by the clerk that Lord Minto would be willing to grant a site for the works upon the following terms—viz.: (1) The area of the ground to be 4½ acres, at the rate of £10 per acre per annum; (2) the town council to settle all claims by the tenant of the ground, including claims connected with the access to the ground; (3) the town council to fence the ground; (4) wayleave for sewage pipes to be granted at the rate of 1s. 6d. per yard; (5) the town council to be liable for all claims for damage caused by the laying or repairing of the pipes, no cess drain to be made on the surface of the ground; (6) if any such are required, to be paid for over and above the wayleave of 1s. 6d.; (7) all minerals to be reserved, with full power to work them, even to the extent of lowering the surface without being liable for any damage which may be caused, the council to pay the whole expenses of the transaction. The councillors expressed surprise at the terms, which they characterised as very harsh. Bailie Hunter (who presided) said it would ruin Lochgelly to accept such terms. Councillor Barclay said the agreement should be published in order to let the people know how they were treated when requiring a piece of land.

Louth T.C.—The council have adopted a report by the Drainage Committee recommending that Mr. Baldwin Latham should be instructed to prepare plans for the additional works required to be carried out for taking all the sewage out of the river Lud, with a view to an application to the Local Government Board for a further loan.

Newquay U.D.C.—The council have approved the plans of the surveyor, Mr. T. Harford, for a sewer in Beach-road, with manholes, at an estimated cost of £250.

Oulton Broad U.D.C.—The council have referred to the Drainage Committee a letter from the Local Government Board urging the adoption of a sewage disposal scheme. It is pointed out in the letter that the cost of emptying cesspools and scavenging is now about £1,000 a year, a sum which would probably cover the cost of maintenance and go towards meeting the expenses of a proper system of sewerage and sewage disposal. Having regard to the financial position of the district, the board stated that they were willing to consider an application for sanction to a loan for a scheme dealing only with the more populous areas, and they think that the council would be well advised to proceed with the preparation of such a scheme.

Petersfield R.D.C.—It has been decided to ask for sanction to a further loan for the purpose of the Liss sewerage scheme.

St. Columb R.D.C.—It is proposed to construct septic tanks in connection with the sewerage scheme for Crantock.

Stoke-on-Trent T.C.—The Sewerage Committee have agreed to adopt the Strongford site for the proposed sewage disposal works.

Sutton (Surrey) U.D.C.—The Farm Committee have requested the surveyor, Mr. W. H. Grieves, to go into the question of treating the sewage on land at the low-level works, and again submit the reports and plans he has already prepared. The question of the [illegible]

Whitby R.D.C.—[illegible] drainage scheme on several roads.

Woking U.D.C.—The engineer has prepared the specification [illegible]

WATER, GAS, AND ELECTRICITY.

Ashington (Northumberland) U.D.C.—The council are promoting a Bill in Parliament seeking powers to secure water from Tosson, Rothbury. The estimated cost of the [illegible] £73,000 for mains outside the Ashington district, and £8,000 for mains, service pipes, &c., inside the district, making £81,000 altogether. When the money is borrowed it is proposed that the £73,000 should be repayable in sixty years, and the £8,000 in thirty years. The present [illegible]

Ayrshire C.C.—The Northern District Committee have reported favourably upon a scheme prepared by the newly formed special water supply district of Barrwill for a loan of £1,500 to cover the cost of a water supply, plans for which have been prepared by Messrs. Watson & Sons, engineers.

Barnes U.D.C.—It has been resolved to present a petition against the London and Home Counties Supply Bill to be promoted by the London County Council.

Bethnal Green B.C.—The council have accepted the tenders of the Lancashire Electric Power Company, Limited, of Manchester, for the supply and erection of [illegible] transformers and [illegible] switch gear. They also decided to issue advertisements inviting tenders for the erection of a western [illegible] at New Inn-yard and an easterly sub-station at the Digby-street depot. An estimate of £15,944 for the supply and laying of cables and execution of road work in connection with the new electricity undertaking has also been adopted. It is to be stipulated that the contract for cables and accessories shall be manufactured by British firms.

Blaenavon U.D.C.—It has been decided to provide [illegible] and a service reservoir at [illegible] at an estimated cost of £6,000.

Bridgwater R.D.C.—[illegible] of a water supply for Chilton-upon-Polden [illegible] forwarded to the parish meeting. The estimated cost of the scheme is £2,272.

Easingwold R.D.C.—The council recently considered the question of an additional water supply, the matter coming up on a letter from the Local Government Board which referred to a proposition to borrow £8,657 for what is known as the Wass scheme, which was designed to give a better supply to Creyke, Easingwold, Sessay, Oulston, Stillington and Thornton-on-the-Hill. The board also asked for the result of the gauges which were to be taken, and it was resolved that this information be given.

Greenock T.C.—Recently the Secretary for Scotland sanctioned the borrowing of £30,000 to make provision for the increasing needs of the electricity undertaking, and at a special meeting on Monday it was decided to ask power from the Scottish Office to borrow an additional £20,000 for the purchase of a new turbo-generator of 5,000-kw. capacity.

Hawick T.C.—The water inspector has reported that between the months of August and December, by the repairing of [illegible] a saving of water was effected to the extent of 390,000 gallons per day.

Islington B.C.—A scheme to extend the municipal electricity undertaking, at an estimated cost of £52,000, has been prepared.

Leake R.D.C.—The council on Tuesday resolved to forward to the parish council a letter from the Local Government Board recommending the provision of a pipe water supply to Sutton Bonnington from the mains of the Derwent Valley Board.

Ludlow R.D.C.—The council have received from Messrs. Willcox & Raikes a report on the Craven Arms water supply scheme, stating that the yield equalled 30,000 gallons a day. The report has been forwarded to the Local Government Board.

Luton T.C.—The electrical engineer has prepared a scheme for the provision of a "stand-by" plant at the electricity works, and this is now under the consideration of the council.

Newcastle West (Ireland) U.D.C.—The ratepayers have expressed a feeling in favour of [illegible]

present system of public lighting by oil lamps, and adopting a scheme of electric lighting.

Nottingham T.C.—The Electricity Committee have been granted authority to raise additional capital for underground mains and services. They have expended the whole of the capital sum of £44,500 sanctioned by the council in November, 1903, and now require £20,000.

Perth T.C.—The question is under consideration of purchasing the undertaking of the Methvin Gas Light Company.

Skipton U.D.C. It has been resolved to apply to the Board of Trade for authority to establish electricity plant at an estimated cost of £13,000.

Southampton T.C.—The question of an additional supply which the waterworks engineer believes is obtainable at Otterbourne was the subject of a report from Dr. A. C. Houston, as the result of the consideration of which the committee offered its cordial thanks and congratulations to the waterworks engineer on his finding of an additional source of supply of water for the borough.

Tanderagee U.D.C.—Messrs. Swiney & Croasdaile, MM.INST.C.E., Belfast, are preparing particulars and estimated cost of a water supply for the urban district from the Portadown and Banbridge Water Board, and from the Glenoran springs.

Wigton R.D.C.—The council recently accepted the offer of the Carlisle City Council to supply water in bulk to the rural council for the supply of Bowness-on-Solway at 8d. per 1,000 gallons, the price to be reduced later to 6d. per 1,000 gallons. The Carlisle Rural Council are opposing the scheme, disputing the city council's right to supply water outside its own area.

MISCELLANEOUS.

Barnes U.D.C. The council have purchased a 60-ft. fire escape, which the surveyor, Mr. C. Bruce Tomes, reports is quite satisfactory.

Cheltenham R.D.C.—In view of the surveyor, Mr. C. Benyon, being called up for military service as a National Reservist, it has been decided to pay him such a sum as with his military pay and separation allowance will make the sum receivable by him equal to his salary at the time of his being called up; also that his post of road surveyor be kept open for him until his return from service.

Hove T.C.—The electrical engineer, in a report on the electricity undertaking, recommends the installation of new machinery at an estimated cost of £6,970. —The present contract for the supply of horses, carts and drivers expires on March 31st, and the Works Committee recommend the acceptance of an offer to continue the contract for a period of one year at the price of 8s. 8d. per day per horse and man.

Northants C.C.—The period of four years in which the county surveyor was to receive £250 per annum to cover all his travelling expenses having expired, the council have resolved that the arrangement be discontinued, and, on condition that the county surveyor continues to provide his own motor-car, that he be paid an allowance of 6d. per mile travelled by motor-car, and his actual railway fares and cost of refreshments.

Woking U.D.C. The question of providing a motor fire engine is to be considered as soon as the time is suitable for raising a loan upon reasonable terms.

Housing and Town Planning Conference. A conference of local authorities in the Western Midlands was held at the Council House, Birmingham, on Tuesday and Wednesday, under the auspices of the Housing and Town Planning Council, to consider housing and town planning administration, with special reference to the administration of the new Housing Act during the period of the war. Councillor Harold Shawcross, chairman of the council, presided. Resolutions were passed urging local authorities to place in hand without delay the necessary preliminary work in regard to housing schemes, and asking that the terms in regard to housing loans under the Act (announced by the Chancellor of the Exchequer in the House of Commons on Tuesday, November 24th) should be maintained without change during the period for which the Act will be in operation, and for the full £4,000,000 provided under the Act.

PERSONAL.

Mr. Richard Saunders, assistant borough surveyor, Gravesend, has been appointed borough surveyor of Sandwich.

Mr. R. S. Scott, surveyor to the Bishop's Stortford Urban District Council, who is indisposed, has been urged by the council to take a holiday.

Mr. H. Norman Jepson, of the borough surveyor's office, Kingston-on-Thames, has been successful in the examination for admission as an associate of the Royal Institute of British Architects.

Prof. E. R. Matthews, of the University of London, has been called in to advise one of the American cities on the subject of coast protection, and will sail for New York when the Easter vacation begins. He has also been called in recently to advise at three of our coast towns.

Mr. Arthur Thomas Walmisley, the author of the illustrated article on groynes and sea walls which appears in the present issue, is well known as the engineer to the Dover Harbour Board, a position which he has held since 1883, besides carrying on private practice at Westminster. Born in London nearly sixty-eight years ago, Mr. Walmisley was educated at King's College School, and subsequently at King's College, London, and commenced his engineering career as articled pupil to the late Mr. R. M. Ordish, of Great George-street. Afterwards

Mr. A. T. Walmisley, M.Inst.C.E.

he became resident engineer upon the Albert Bridge, Chelsea, and later entered the office of the well-known Westminster firm of Edwin Clark, Punchard & Co. Here he served directly under the late Mr. Edwin Clark, who acted as resident engineer under Robert Stephenson on the Britannia and Conway tubular bridges. Subsequently he assisted Mr. Clark's brother, Mr. Latimer Clark, with designs for floating docks. In 1876 Mr. Walmisley was engaged under Mr. (now Sir) Alexander Binnie upon the Bradford reservoir and high-level water supply. A year later he returned to London, and commenced practice as a civil engineer in Victoria-street, and has since carried out many notable works. Mr. Walmisley has frequently given evidence before Parliamentary Committees, and has acted as arbitrator in numerous legal cases. He is a prominent member of the Institution of Civil Engineers, a past-president of the Civil and Mechanical Engineers' Society and of the Society of Engineers, a Fellow of the Surveyors' Institution, an hon. associate of the Royal Institute of British Architects, and a lecturer on waterways, harbours and docks at University College, London. Finally, it may be mentioned that he is the author of "Iron Roofs"—which has passed through a second edition—"Field Works and Instruments," "Land Surveying and Levelling," and numerous articles and monographs on professional subjects. Mr. Walmisley is senior partner in the firm of A. T. Walmisley & White.

SCIENTIFIC OBSERVATION IN ROAD CONSTRUCTION.*

By F W [illegible] Assoc.M.Inst.C.E.
Engineer and Surveyor to the Frome Urban District Council.

It would seem that the subject occupying the chief attention of municipal engineers and surveyors is at least the one on which we all meet on common ground, is that of highway construction. The difficulties peculiar to our sewage schemes, water supplies and housing and town planning are more personal affairs, requiring a more local treatment than this great question of our highways. This is a personal question so far as the principal roads of the country are concerned.

If these roads are to be made fit for the traffic which they are called upon to perform road engineers must couple science with practice in order to achieve the desired end. To pursue the old policy of dumping many tons of stone of low cost per ton [illegible] can be obtained locally, only to result in the production of mud and dust in a ratio increasing [illegible] as the increase in traffic, is utter folly and a serious waste to the community, besides causing grave discomfort to all road users.

It is manifestly evident to the most casual observer that the roads which were built for the comparatively light traffic of the past cannot be considered equal to the task of supporting the heavy [illegible] of present-day motor lorries and other heavy motor traffic. The bridge engineer cares for the bridge for the load it has to carry, and the road engineer must be afforded the means of designing the road for the load it has to carry, and I would add that the road engineer of to-day can do this if a means can be afforded him of using the right material.

Local authorities are not always easily persuaded of the necessity for a change in their road-making policy, and, even in the face of the best advice of their servant the engineer, they cling to old ideals. Under such circumstances the most convincing argument that the engineer can possibly bring to his aid is that of cost. Careful kept records of the cost of maintenance, class of foundations, and traffic and weather conditions are absolutely essential to the road engineer, and are the best evidence upon which to base advice to those employing him.

Coming to another phase of the question, however wicked some local authorities may be to effect an improvement on their roads sufficient to meet the enormous increase in the traffic which has come upon them, they cannot satisfy their wish owing to lack of sufficient funds. To meet the state of affairs it is hoped that ere long the unfair burden cast upon the ratepayer by long-distance through traffic on his roads will be lightened by the cost of maintenance of the more important roads being made a national charge, as a result of the classification of highways. Such a step as this followed by properly organised investigation on scientific and practical lines, ought to prepare our greatest highways for that even more exacting demand which will yet be made upon them.

RECENT PROGRESS.

The greatest credit should be given to those road engineers and others who have by individual personal investigation assisted in the advancement of our knowledge of road construction during the past few years. There are those who have given us the benefit of practical work done in this cause, others have gone outside the orthodox methods, and have endeavoured to analyse the subject upon purely scientific lines. It will be interesting to know how far scientific observation can assist in solving the road question.

Apart from the examination of the materials constituting a water-bound macadam road there is very little opportunity for science in the actual structure of such a road; that is to say, it would be difficult to bring applied mechanics to bear upon the question of foundation or crust strength in a material which is as quickly affected by weather conditions as a water-bound macadam. I fear the search for varying values of K, which, let us imagine, is the factor to be incorporated in the formula for weather conditions would only end in a visit to Wells, not necessarily for the purpose of seeing if the county surveyor had succeeded in the quest, but to enter a well-known public institution there for necessary rest. There is, however, room for science in the choice of the road constructed with a rigid concrete foundation, and a [illegible] attended the efforts of the road designer, that he should [illegible] a knowledge of the strength of materials which it is proposed [illegible] be discussing the efficiency of our roads in terms of moments of resistance of the material composing them, as opposed to the bending moments, shear and deflection produced by the loads they have to carry.

To [illegible] age of roads throughout the United Kingdom, built, as these roads will have to be, upon a variety of subsoils, the fundamental necessity must be a solid foundation, and in the provision of this science will help the engineer to decide upon the minimum section of foundation to adopt for any particular traffic load. Then, as regards the wearing crust to be placed upon the foundation, scientific investigators have already been at work upon various materials many of which [illegible] upon water-bound macadam. Doubtless in future, under the guidance of the Road Board, this work will be [illegible] as to allow of easy comparison. Such a course would, it is imagined, lead to the desired goal in a quicker and less expensive way than can be effected by the individual worker.

* Extracts from presidential address delivered at the annual meeting of the Association of Somerset Surveyors on Saturday last.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr J S Pickering, M.Inst.C.E. Borough Surveyor and Water Engineer, Cheltenham.

DONCASTER MEETING.

A North-Eastern District meeting is to be held at [illegible] (Saturday).

Programme.

2.30 p.m.—Meeting in Mansion House. Short paper [illegible] Notes on Extract from Traffic," by Mr. F. Oscar Kirby, M.Sc., Assoc.M.Inst.C.E., borough engineer, Doncaster.

1.30 p.m.—Tea, by kind invitation of his Worship the Mayor (Mr. S. Balmforth).

3.0 p.m. [illegible]

[illegible]

[illegible]

[

ROYAL SANITARY INSTITUTE.

MANCHESTER MEETING.

At a meeting of the Royal Sanitary Institute to be held at Manchester on Friday, February 19th, a discussion on "The Construction of Sewers," which will be illustrated by lantern slides, will be opened by Mr. S. S. Platt, M.Inst.C.E., borough engineer of Rochdale, and on "Housing from the Sanitary Inspector's Standpoint," by Mr. H. Dryland, of the Manchester Sanitary Department.

The chair will be taken at 7 p.m. by Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A.

On the following day the chairman of the Rivers Committee of the corporation, Alderman Frowde, has kindly consented to arrange for the members to inspect an interesting section of the Manchester main drainage scheme.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Monday next, at the Institution of Electrical Engineers, Victoria Embankment, W.C. (south end of Savoy-street, near Waterloo Bridge), Mr. H. C. H. Shenton (president, 1914) will present the premiums awarded for papers published in the *Journal* during 1914.

Mr. Norman Scorgie, the president for 1915, will then deliver his presidential address.

The chair will be taken at 7.30 p.m. precisely.

A. S. E. Ackermann,
Secretary.

17 Victoria-street, S.W.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

APPOINTMENTS OPEN.

COUNTY COUNCIL OF NOTTS.
APPOINTMENT OF COUNTY SURVEYOR.

The County Council of Notts are desirous of receiving applications for the office of County Surveyor. The person appointed will be required to reside in or near to the Town of Nottingham, and to devote the whole of his time to the discharge of the duties of the office. He will not be allowed to engage in any private practice.

The salary will be £750 per annum, and, in addition, travelling expenses will be paid.

Applications, marked "County Surveyor," with copies of not more than three recent testimonials, must be made upon Forms which will be forwarded by me upon receipt of an addressed foolscap envelope.

The applications must reach me not later than midday on Saturday, the 27th day of February, 1915.

Canvassing is strictly prohibited, and will be deemed a disqualification.

(By order)
H. HAMPTON COPNALL,
Clerk of the County Council.

Shire Hall,
Nottingham.
February, 1915. (2,304)

(Continued on p. xl.)

MISCELLANEOUS.

WANTED, at once, good Second-hand Contractor's Level, with Staffs and Legs complete.—Sanders & Torrance, Contractors, Stoke-on-Trent. (2,310)

(Continued on p. xlviii.)

4. Broken Slag.
5. Tar-spraying.
6. Distilled Tar.
7. Crossing Blocks.
8. Yorkshire or Lancashire Kerbs, Flags, and Channels.
9. Concrete Flags.

Specifications and Forms of Tender may be obtained on application to the undersigned, to whom sealed and suitably endorsed Tenders should be delivered not later than first post on Wednesday, February 17th, 1915.

The Corporation do not bind themselves to accept the Lowest or any Tender.

V. W. WARD, ASSOC.M.INST.C.E.,
Borough Surveyor.

The Square,
Shrewsbury.
January 27, 1915. (2,303)

CLEETHORPES URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the Supply of the following Materials for a period ending 31st March, 1916

1. Chalk. 2. Granite. 3. 2-in. Concrete Flags. 4. Bottoming Tar-macadam. 5. Topping Tar-macadam. 6. Straight York Kerb. 7. Straight York Channel. 8. Granite Radius Kerb. 9. Granite Radius Channel. 10. 9-in. Ordinary Pipes. 11. New Gullies. 12. 6-in. Stanford Pipes. 13. Ordinary Pipes.

Specifications, Schedules and Forms of Tender may be obtained on application to Mr. C. H. Waithman, ASSOC.M.INST.C.E., Council House, Cleethorpes.

Sealed Tenders, endorsed "Material. Contract No. ——," addressed to the undersigned, to be delivered to this Office not later than 12 o'clock noon on Monday, the 8th day of February, 1915.

B. GREAVES,
Clerk to the Council.

Council Offices,
Cleethorpes.
January 27, 1915. 2,30[illegible]

COUNTY BOROUGH OF HALIFAX.
HIGHWAYS COMMITTEE.

Tenders are invited for the Supply of the following Stores and Materials required in the Highways Department of the Halifax Corporation during the 12 months ending 31st March, 1916—viz.:—

Schedule No.
1. Paving Setts, Flags, Kerb, &c.
2. Granite, Limestone Chippings, and Lime.
3. Portland Cement.
4. Gravel and Sand.
5. Earthenware Pipes.
6. Granite Paving Setts.
7. Artificial Flags.
8. Horse Provender.
9. Coal (in small quantities).
10. Castings (Manhole Covers, Gullies, and Name Plates).
11. Wrought Iron, Shovels, Picks, Ironmongery, &c.
12. Oils, Paints, Candles, Gunpowder, &c.
13. Cotton Waste and Gaskin.
14. Brooms and Brushes.
15. Timber.
16. Precipitants for Sewage.
17. Filter Cloths for Sludge Pressing.
18. Team Labour.

Forms of Tender, Specifications, and further particulars may be obtained on application to Mr. James Lord, M.INST.C.E., Borough Engineer, Halifax. Intending Contractors must state the number of Schedule required.

Tenders, in the envelope provided, must be sent to the undersigned not later than 12 o'clock noon on Saturday, the 13th February, 1915.

Any Sample submitted by the Tenderers (which will not be paid for by the Corporation) must be marked "Sample, Tender for Highway Stores," and sent to the Borough Engineer, Town Hall, Halifax.

The persons whose Tenders are accepted (except as to Coal) will be required to observe the Fair Contracts Clauses adopted by the Corporation.

The Committee do not bind themselves to accept the lowest or any Tender.

(By order)
PERCY SAUNDERS,
Town Clerk.

Town Hall, Halifax.
January 27, 1915. (2,307)

KEYNSHAM RURAL DISTRICT COUNCIL.
SUPPLY OF MATERIAL, 1915-16.

The above Council invite Tenders for the Supply of Granite or Basalt, Limestone, and Tarred Macadam, delivered to the various Stations in the District, for the year ending March 31, 1916.

Forms of Tender and Specifications can be obtained from the undersigned.

Tenders, endorsed "Supply of Road Material," are to be delivered to F. G. Whittuck, Esq., Clerk to the District Council, Keynsham, on or before Friday, the 12th February, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

J. JOHNSON,
Surveyor of Highways.

Surveyor's Office,
Keynsham,
Bristol.
January 26, 1915. (2,302)

KEYNSHAM RURAL DISTRICT COUNCIL.
STEAM ROLLING.

The above Council invite Tenders for the Supply on Hire of two or more Steam Rollers and Scarifiers for use on their main and district roads for one, two, or three years, commencing from the 1st April, 1915.

Specifications can be obtained from the undersigned.

Tenders, endorsed "Steam Rolling," are to be delivered to F. G. Whittuck, Esq., Clerk to the District Council, Keynsham, on or before Friday, the 12th February, 1915.

The Council do not bind themselves to accept the lowest or any Tender.

J. JOHNSON,
Surveyor of Highways.

Surveyor's Office,
Keynsham,
Bristol.
January 26, 1915. 2,301

The Surveyor

And Municipal and County Engineer.

Vol. XLVII. FEBRUARY 5, 1915. No. 1,203.

Minutes of Proceedings.

Urban Land and Town Planning.

At the last meeting of the Town Planning Institute the relationship between the urban land problem and town planning was discussed on an interesting paper by Prof. S. D. Adshead, F.R.I.B.A., some extracts from which will be found in another column. The paper was loosely divided into two parts, dealing respectively with the acquisition and utilisation of urban areas. It is manifestly a difficult matter to determine what is a fair price to be paid to the owner when urban land is required for public purposes and many of the unsatisfactory features of the procedure at present available were clearly pointed out by Prof. Adshead. In regard both to the matters which have been held to be proper subjects for compensation and to the basis upon which compensation is assessed the procedure has been found on the whole to err on the side of generosity to the owner. We venture to think, however, that the statement that the 10 per cent which is invariably added to the ascertained price "has no calculable asset whatever" may be based upon a misapprehension. It is true that to-day it is added mechanically and as a matter of course, but it had its origin in compensation for disturbance of capital and the variations in the money market and suitable opportunities for investment, and until the 10 per cent became stereotyped evidence was frequently given at great length in regard to these matters. We are not defending the present use of the 10 per cent, but merely pointing out that historically it has an intelligible meaning. Prof. Adshead further points out that under the Lands Clauses Acts an owner cannot be compelled to sell part of a structure if he is able and willing to sell the whole, even though the whole may not be required. Cases of this class are always difficult to deal with, and have been the subject of almost all the litigation which has resulted from the operation of Michael Angelo Taylor's Act, which is applicable to street widenings in the metropolis. The effect of the decisions under that ancient statute is that if the local authority seek to take part only of a house they may be compelled to take the whole of the less of what they really require will destroy the identity of the house as a house. On the other hand, they may be restrained by injunction from acquiring the whole of a house if part only is required for the widening and the owner is desirous of retaining the remainder. It is not easy to see how the difficulty of such cases can be surmounted in a better or fairer way than that provided by the Lands Clauses Acts.

Dealing next with the utilisation of urban land, Prof. Adshead entered a plea for a Town Planning Act with reference to built-up urban areas, and suggested that local authorities should have power of control over the reconstruction of properties lying on the sides of [illegible] streets and over the class and character of new buildings to be erected in [illegible]. The latter part of the paper was concerned with urban housing. An examination of the comparative merits of block buildings and separate cottages led, of course, to the conclusion that, apart from the argument from necessity, the separate cottage is in every way preferable. There followed some trenchant criticisms of existing by-laws, a plea for greater elasticity, and an examination of the types of cottages suggested in the Memorandum issued by the Local Government Board last year. Prof. Adshead finally asked the question, Who is to be responsible for the design and erection of these working-class cottages which local authorities are authorised and encouraged to erect? The answer given was, Not the municipal engineer, but the architect! "The work of the municipal engineer is closely connected with that of the architect in so far as they are both concerned with the mixing of concrete and the erection of a brick wall, but the partnership separates here. For the [illegible] the ability of the untrained practitioner added to the experience of the observant amateur." This sounds to us like the language of disappointment, and inasmuch as the Local Government Board have stated—as Prof. Adshead points out—that houses erected by a local authority ought generally to be such as will be a model or standard for houses for the working classes which may be erected by private persons (and, we may add, designed by private architect(s), and further that the erection of such cottages by local authorities has in many cases, in fact, caused an improvement in the standard of private building, municipal engineers will know what value to place upon this professional dictum.

*

The Future of Municipal Engineering.

In his inaugural address as president of the Society of Engineers last Monday evening, Mr Norman Scorgie, borough engineer of Hackney, dealt with some of the principal changes that have occurred in municipal engineering work during the past twelve years, and made some attempt to penetrate into the future. In confining himself to a broad survey, and avoiding the discussion of details, the new president probably adopted a wise course, his task being to interpret to an audience representative of every class of engineering practice the main features of the present situation in regard to municipal work. The first point to which attention was drawn was the com-

parative rarity of the specialist in the field of municipal engineering. In all the larger commercial undertakings the specialist reigns supreme, but the more or less arbitrary division of the country into "districts" for local government purposes has retained for the municipal engineer an extraordinarily wide range of duties. True, there is a certain tendency to-day towards the combination of districts for special purposes, but with the removal of certain obstacles we are convinced that the future will witness a very large extension of the principle of co-operation between neighbouring authorities. The next important sign of the times to which Mr. Scorgie referred was the decay of the idea that the spending of public money is always an evil to be avoided, if possible. Indeed, in certain quarters to-day the opposite extreme has to be guarded against. In this connection we cordially support the protest made in the address against the misleading division of municipal expenditure into productive and unproductive. There are still to be found many whose souls are so far in the grip of mammon that they are totally unable to conceive the idea of an undertaking being really "productive" or "profitable" to the community in the absence of a monetary dividend. This attitude of mind can only be combated by continually insisting upon the benefits derived by the community in the way of improved health and conditions of living by a judicious expenditure upon sanitation, water supply, and kindred works.

Mr. Scorgie next turned to the consideration of the question whether the present wide scope of municipal engineering is likely to be a permanent condition, which he answered by a partial negative. We have already alluded to the modern tendency towards co-operation, and it follows that, with larger areas, there will be much greater scope for the employment of the whole-time specialist. In the great centres of population, however, still greater developments are possible in the direction of complete municipal federation. The whole idea of the federal system of government, whether municipal or national, is to reconcile local jealousies with a growing sense of unity. The question arises in its most acute form in the problem of Greater London, but it appears that it is also becoming an issue in current municipal politics in the Manchester district and elsewhere. It will thus be seen that signs are not wanting of future changes of a fundamental character in our system of local government. In our opinion Mr. Scorgie, in his address, took a statesmanlike view of the present situation, and although it will probably be many years before the influences at work come to fruition, it is well to remind ourselves that there is no inherent or absolute permanence in institutions, which we are apt to find it difficult to view in their true perspective owing to their very proximity.

* * *

Mechanical Filtration.

Mechanical filtration has recently been dealt with very fully by the *Engineering Record* of New York. Owing to the difficulties encountered in the underdraining, washing, and air-pressure systems in use, and to the difference in opinion existing among engineers, several operators and engineers were asked to give their views and experiences. The essential difference between the mechanical filter and the ordinary sand filter is in the washing and agitation of the sand by means of air and wash-water forced in below the sand layer; thus the underdrain practice is the most important matter in relation to the subject of mechanical filtration. It is possible to pass water through a 30-in. layer of sand at a quick rate according to the pressure due to the head of water, but the sand is naturally clogged thereby at a quicker rate, and needs to be cleaned. In order to clean the sand, water was admitted below the sand layer. The simplest form of filter generally had a false bottom of perforated metal, upon which rested the sand sometimes or a layer of gravel. When water was admitted below the false bottom it was apt to result in unequal distribution, especially with high pressure. Thus some form of agitator was found to be necessary in order to clean the sand, and mechanical and air agitators were used. As an improvement a system of channels, upon which perforated grids were fixed, was invented, and the water was admitted at many points, thus giving a better distribution of wash-water. Air agitation of the sand was introduced, compressed air being admitted under the strainers, passed up through the gravel and agitated the sand, washing being thereby facilitated. This sometimes had the effect of displacing the gravel, and it was sought to overcome the difficulty by increasing the depth of the gravel or by fixing screens above the gravel. Another plan was to discharge the air above the gravel layer. The velocity of the flow of the wash-water has generally been too low to clean the filter, unless the sand were disturbed by air pressure or by mechanical means, but in the more modern system a higher velocity of the wash-water has been given, and this gives such a good result that agitation by the wash-water currents is so satisfactory that other methods of agitation are unnecessary.

The use of high wash-water velocities has made some method of keeping the gravel in place necessary, and thus great attention has been given to the perfecting of methods. Several points have to be borne carefully in mind. The sand must not be washed away, although it must be thoroughly agitated and cleaned. The gravel layer must not be disturbed, and the sand must not pass through the gravel layer into the underdrains. Some difficulty has also been experienced through strainers coming loose or wearing out, while an uneven surface at the side of the tank may cause the formation of a ring of clogged sand, which cannot be easily removed. The filters, first made in circular iron or wooden tanks, are now generally made in rectangular concrete tanks in the case of large installations, so that care is required in forming the interior surface is obvious. It must not be supposed because the construction of mechanical filters has been perfected that those filters put in ten years ago have proved to be unsatisfactory. On the contrary, it is remarkable that the shortcomings reported are of minor importance, and that excellent results have generally been obtained. There is every reason to suppose that with the perfection of designs the economical working of the system will be improved.

* * *

A Filing System.

In these days, when articles are being written in technical journals and papers are being read before the various professional societies upon almost every conceivable variety of subject of any interest, direct or indirect, to engineers, it is impossible to complain that the experience of each member of the profession is not at the disposal of his brethren. The very magnitude of the flow of literature, however, may render the individual productions useless by being lost in the mass unless some system of filing and indexing is adopted. To this end various devices have been tried, but we do not remember to have seen any which combines simplicity with completeness to the same degree as that submitted to us by Mr. James Eastwood, the engineer to the Sowerby Bridge Urban District Council. The characteristic part of his plan is the use of the card index. If, for example, an article can be briefly summarised, such a summary is made on one of the

roads and filed away alphabetically. The method may be illustrated by the following examples:

HIGHWAYS.

Dedication of Subsoil.

THE SURVEYOR, Vol. xlvi., December 18, 1914, p. 702, leading article.

Landowner dedicating highway does not part with ownership of soil. Still entitled to minerals which do not prevent use of public right of way, but subject to the Public Health Act, 1875, s. 149. He can remove timber, and can prevent pipes being laid in it except under statutory powers—*e.g.*, pipes for pumping [illegible] (*Wolf Cub Colliery v. Hornby*, 61 J.P., 375).

Also see *Tithe Redemption Commission v. Runston*, 14 Ch. D., 706).

Also as to underground [illegible] (*Baird v. Fenton*, 8 H. & C., 394, 1859, 2 Q.B., 367).

Authority can prevent pipes and wires being laid in street without their consent, but if pipes, &c., are laid before they can interfere, they cannot order their removal, but can prevent road being opened for their repair.

If an article should be [illegible] the entry on the card is confined to the title and a brief indication of the scope of the article.

SEWAGE DISPOSAL.

Recent Study.

Paper by Edward Ardern, M.Sc., F.I.C., read at the annual meeting of Sewage Works Managers (THE SURVEYOR, Vol. xlvi., December 18, 1914, p. 714, and leading article, p. 702), gives results of experiments at Manchester and Salford.

Also discussion on above paper (December 25, 1914, p. 754).

With suitable conditions an entirely satisfactory effluent could be obtained with Manchester sewage in intimate contact with a quarter of its volume of activated sludge [illegible] six hours. The initial production of activated sludge took three to four days. [illegible] treatment from an engineering standpoint as to cost.

Similarly, newspaper cuttings may be filed by pasting them on to the cards at [illegible] should, of course, be [illegible]. The thanks of himself and his readers are due to Mr. Eastwood for placing [illegible] at our disposal.

* * *

Extraordinary Traffic.

In [illegible] articles on the subject of extraordinary traffic which have been published from time to time in these columns we have endeavoured to guide the municipal engineer through the intricacies of some of the leading decisions of the courts. We cannot help feeling, however, that the surveyor to a local authority, the issue of whose formal certificate is a condition precedent to the recovery of expenses, has at least equal interest in some practical aspects of the question as he has in the subtleties of legal argument. In emphasising this point of view, the paper which was read before the Institution of Municipal and County Engineers at Doncaster by Mr. F. Oscar Kirby, the borough engineer, has a special value. The difficulty of deciding in any given case whether traffic is or is not extraordinary has been considerably increased of late by the growing use of traction engines and heavy locomotives. Once satisfied on this point, however, the duty of the surveyor is to keep observation and subsequently to issue his certificate. The several points to be borne in mind in the discharge of this responsibility are clearly and concisely brought out in Mr. Kirby's paper, which will be found in another column, and cannot well be further summarised. We may say, however, that we have considerable sympathy with the suggestion that some compensation should be made to those highway authorities whose roads have been substantially damaged by traffic of a military character during the past few months. This traffic is certainly "extraordinary," and it is a little difficult to see why the cost of this part of the mobilisation should fall upon the ratepayers of the districts affected. The whole question of extraordinary traffic is very involved, and we fully agree with Mr. Kirby that if anything can be done by amendment of the law to facilitate the recovery of expense with which local authorities are saddled, and to render [illegible] the highway administration, it is desirable that the powers that be, and in particular the institution, should take the necessary steps without delay.

* * *

Standard Pipe Flanges.

Among the most useful investigations undertaken by the Engineering Standards Committee a place must be given to the inquiries of the Sectional Committee on pipe flanges, the conclusions of which were embodied in a report published towards the end of 1904. The work of the committee necessarily demanded the careful consideration of a number of points of detail, in regard to some of which interesting experiments have since been conducted by Mr. John Dewrance. A paper on the "Standardisation of Pipe Flanges and Flanged Fittings," which that gentleman read at the last meeting of the Institution of Mechanical Engineers, [illegible] of peculiar interest. In concluding, the author pointed out that some manufacturers hold that by using their own standard sizes of flanges they influence their customers to come to them for renewals and additions of plant; but as they must also be prepared to supply to British standard sizes, it is probable that any advantage they gain by retaining their own standard is counterbalanced by the extra cost of using two standards. In cases of breakdown the enormous advantage to large users of machinery of a standard cannot in general be over-estimated. Fittings of subsidiary machinery can in emergency be transferred to the most important uses. Spares are fewer and more generally useful, and renewals can often be obtained from stock; whereas special flanges require special fittings throughout, and this, in the case of cast steel, [illegible] The British standard for pipe flanges is certainly the most largely adopted at the present time, and Mr. Dewrance suggested to those members of the institution who have not already adopted it that they should give the matter their careful consideration.

* * *

The London Electricity Scheme.

The electricity scheme of the London County Council is very generally condemned by the local authorities in the area affected by its provisions, and a conference of metropolitan borough councils owning electricity undertakings has prepared a report in which the proposed scheme is criticised in detail. The conclusions arrived at, briefly summarised, are that, given fair play and an equal opportunity, the present authorised distributors feel that they are capable of rendering yet greater service in the future. They describe the new proposals as hazardous from a financial point of view, as subversive of municipal independence, as achieving so little by endangering so much, and they state that they are the less called for, inasmuch as an outline of means is contained in existing legislation which, if pursued and developed, is capable of dealing with all the evils alleged. The opposition to the London County Council enterprise outside the council chamber is without doubt a very powerful one, and inasmuch as upon this occasion it is unaffected by party considerations, its influence upon the ultimate fate of the scheme was bound to be considerable. It was indeed so powerful that at the London County Council meeting on Tuesday the majority necessary failed to confirm the recommendation to proceed with the Bill, which will not, therefore, come before Parliament this session.

The Treatment of Waste Liquors from Tin-plating and Galvanising Works.—(4.)

By G. BERTRAM KERSHAW, M.AM.SOC.C.E., M.INST.C.E., Late Engineer to the Royal Commission on Sewage Disposal.

The tin-plating industry is mainly confined to the South Wales district, some 90 per cent of the mill-being situated in the counties of Glamorgan, Carmarthen, and Monmouth, while galvanising forms an important industry at Wolverhampton, Birmingham, and many other Midland towns.

In the galvanising process the plates or articles, after cleansing, are placed in a pickling liquid consisting of sulphuric or hydrochloric acid and water. The acid is then washed from the plates—which are sometimes also scoured with sand and they are dipped into molten zinc. The wastes arising from the discharge of the stale "pickle" and water used for washing the acid from the plates are extremely acid, and require neutralisation by lime and settlement. The waste liquors derived from galvanising are similar to those resulting from tin-plating, and the treatment of the wastes from the two industries may be dealt with conjointly at a later stage.

Tin-plating consists in covering thin sheets of iron or steel with tin, thereby doing away with their liability to rust, as when uncoated.

"Terne" is a term used to denote plates which are covered with a mixture of tin and lead.

Frequently tin-plate works are carried on in conjunction with steel works, the steel being made at the same works where the tin plates are prepared.

The process of manufacture of tin-plates following the production of the steel bars is an interesting one, the various operations being as follows: Bar-cutting, rolling, shearing, opening, black pickling, black annealing, cold rolling, white annealing, white pickling, tinning, cleaning, dusting, sorting and packing.

Bar-cutting and Rolling.—The steel bars, measuring about 7—10 in. wide by ⅝—¾ in. thick, are cut into lengths of about 20 in.; they are then heated to dull red and passed four or five times through chilled cast-iron rolls, when they are returned to the furnace. After reheating they are again passed through the rolls, doubled upon themselves, flattened, and transferred to the finishing furnace for another heat.

Shearing.—When sufficiently hot they are passed through the finishing rolls, and again doubled and flattened, while the edges coming together on the first doubling are sheared off and the pieces returned to the finishing furnace, and, when hot enough, the doubled sheets are once more rolled and doubled, trimmed with the shears, and again returned to the furnace for the final heat, after which they are rolled out to the required length, stacked, and allowed to cool before shearing.

Opening.—Each piece of steel plate (consisting of eight layers) is now cut to the required size for the finished plate, and is then ready for opening. The rolling operations, previously described, have the effect of causing the sheets to adhere to one another, and they have to be separated. This is brought about by vertical cleavage with a special knife.

Black Pickling.—The next process (black pickling) consists in dissolving the oxide of iron from the sheets by means of dilute sulphuric acid in pickling vats. The plates are disposed in bundles on a metal cradle, and immersed in a hot solution of sulphuric acid, the cradle meanwhile being moved backwards and forwards, and the liquor agitated. After remaining in the vat for three or four minutes the plates are transferred to a vat containing tepid water, and they are washed to remove as much acid as possible. Bran and water is thrown into the acid vat, forming a thick froth on the surface of the liquid, and this reduces the rapid evolution of gas which would otherwise occur during pickling.

Black Annealing.—The next process consists of black annealing, to soften the plates and to remove water stain. They are put under a receptacle sealed with sand round the lower edges, placed on a carriage, and run into the annealing furnace, where they remain for about ten hours. After withdrawal from the furnace they are left in the closed receptacle to cool slowly.

Cold Rolling.—The plates are next subjected to cold rolling by passing them under great pressure through polished cast-iron rolls, in order to give them a good surface.

White Annealing.—This is necessary to restore softness and pliability to the plates after cold rolling. During this process the plates are kept in the furnace for about seven hours, but they are exposed to a lower temperature than that employed for black annealing.

White Pickling.—The plates are next white-pickled to remove the oxide scale formed in the last two processes, and this operation resembles that employed for black pickling, but a weaker solution of sulphuric acid is used. The plates, after white pickling, are washed in clean water, and then transferred to a water bath, or "bosh," where they remain immersed until ready for the tinning process.

Tinning.—Tinning is accomplished by passing the plates through the tinning machines, of which there are two types—viz., horizontal and vertical. The former consists of two parts, the tin pot and the wash pot; the molten metal in the latter being kept at a slightly lower temperature than the former. A thin layer of palm oil prevents oxidation of the metal. Other portions of the horizontal machine are the grease pot, the flux box (containing zinc chloride), and the "scruff" box. The plates to be tinned are taken from the water bosh and passed while still wet through the layer of flux into the molten tin. Metal guides direct the plates into rolls, which revolve slowly in the metal of the tin pot. From these rolls the plates are drawn by other rolls through the wash pot and grease pot, emerging brightly coated with tin; the plates are then received by a "riser" and removed for cleaning and dusting, these two operations now being frequently carried out by machinery.

Cleaning and Dusting.—The cleaning machine removes the grease by passing the plates through a bed of absorbent material, while the dusting machine passes the plates between rollers covered with sheepskin, which gives the plates a high polish.

The two remaining processes consist of assorting and packing.

The waste liquors produced bear a strong family resemblance to those coming from galvanising works, and they consist of the liquor from the black and white pickling vats, and the wash waters (sometimes termed "swilling" waters) used for freeing the plates from acid. The pickling liquors are very acid, and contain large quantities of ferrous sulphate, and if they are discharged into streams they coat the bed and sides with a red deposit, killing fish, and destroying all vegetation. Such liquors, when discharged in large volumes into sewers, are injurious by reason of the action of the acid on the joints of the sewer. The waste waters, although less acid than the pickling liquors, are also very injurious to streams; further, they are very large in volume.

After the liquor in the pickling vats has been in use for some time it becomes very strongly impregnated with sulphate of iron, and this is sometimes recovered by evaporation in wooden tanks, lined with lead, scrap-iron sometimes being used to "kill" the acid, the crystals obtained being sold. Much depends upon the market price of copperas as to whether the process is a profitable one or not. When hydrochloric acid is used as a pickle the contents of the pickling vat are rarely recovered. Turner's recovery process for this pickle has been used for some years, and a description of it is given in Naylor's "Trade Wastes."* In this case the substance recovered is oxide of iron, which is very extensively used in making paint.

In cases where both pickle and waste waters are discharged direct to the sewers, it is very desirable that they should be mixed together before their discharge in a suitable storage tank; moreover, the liquors should be neutralised and discharged equally throughout the day, and not run off in sudden flushes. In many cases, however, sewers are not available, and in such cases lime should be added to neutralise the acidity, and the liquid should undergo efficient settle-

* Chas. Griffin & Co., London, 1902.

ment, while sludge-straining tool will be needed once a large quantity of sludge is produced.

Needless to say, however, at the coppersmiths' operation from trouble resulting from the use of sulphuric acid could be carried out wherever practicable since the most serious of the troubles of the water-repellent undertaking. A very important point it may be observed, is likely to result from the neutralisation of the acid, as by this and previously mentioned means would probably be found a solution of the difficulty in this respect.

In some cases spent pickle is returned to the vanisers to the manufacturers of the acid, and Mr. W. C. Heard was asked if the chemical contractors in the Wolverhampton area would undertake the work of neutralising acid at Wolverhampton.

Approximately two-thirds of the total sales anticipated in Wales are expected, and the outbreak of the present war almost brought the industry to a standstill since the Government took an embargo of tin-plates to Holland and Scandinavia has resulted in large stocks being held up in the country.

In his next article Mr. Kershaw will deal with the [illegible] industry.

THE SURVEYORS' INSTITUTION.

PRELIMINARY EXAMINATION, 1915.

The following candidates passed the examination held in the above:

Messrs. H. G. Anthony, Cambridge; D. B. Clarke, J. J. Bevan Lazzer, jun., W. L. Collins, Newport; R. C. Collinge, Dewsbury; L. L. Cossey, Bridgwater; Derby; H. C. Green, Rugby; K. J. Cracknell, North Finchley, N.; L. E. Eagles, Commercial-road, E.; J. W. Edwards, Abergele; H. S. [illegible]; H. Fox, [illegible]; C. [illegible]; D. [illegible]; L. M. Gore, Wembley; C. A. G. [illegible]; J. P. K. [illegible]; Pegram; H. M. Gray, Cranford; H. C. Halliday, Grantham; R. K. Henson, Tonbridge; A. Hodge, Cricklewood, N.W.; G. P. Hopson, Newbury; H. H. Huddy, Little [illegible]; F. T. James, Swansea; H. [illegible], Newport; Miss L. Jennings, Liverpool; G. I. Knowles, Carnforth, Lancs; F. Lee, Mansfield; H. L. Madge, Denmark-hill, S.E.; M. A. Marston, Chelsea, S.W.; W. O. Martin, Caversham; P. Muriel, Bishop's Waltham, Hants; W. Murray-Harris, Balham High-road, S.W.; G. R. Neville, Feltwell, Norfolk; G. F. L. Pelham, Woodford, Essex; W. C. Perkins, St. Germans, Cornwall; N. Petter, Darlington; D. C. Platt, Barnes, S.W.; R. T. Pope, Neath; J. A. Prescott, Lerwick, Caithness-shire; L. Rees, Stoke-on-Trent; R. I. Richards, Blandford; J. E. B. Robson, Dover; E. W. Roper, Weymouth; V. C. C. Smith, Streatham, S.W.; G. F. Sogno, Horsham Road, Sussex; H. R. Strong, Newport, Mon.; A. E. Tilley, Highbury, N.; J. L. Trollope, Banstead, Surrey; C. K. Turner, Worcester; J. R. B. Turner, Loughborough; A. G. West, West Dulwich, S.E.; V. R. Westrope, Ashwell, Herts; C. Wilkins, Longton, Lancs; H. T. Wilkinson, Wellsway, Bath; N. C. Windross, Hessle, East York; G. I. Winterbottom, Bargoed; Hull and W. T. Woodward, Stowmarket.

SCOTTISH CANDIDATES.

Messrs. A. L. Chapman, Lockerbie and C. S. Orr, Glasgow.

IRISH CANDIDATE.

Mr. D. O'Brien, Mitchelstown, co. Cork.

The Supply of Road Materials. It is reported by the borough engineer of Kensington, Mr. A. R. Finch, that for some time past he has been unable to secure a supply of Guernsey granite from the council's contractors, who recently pointed out that they had great difficulty in arranging delivery of sea-borne material. They asked the council to bear some portion of the additional expenditure incurred in executing the orders. The request was not at first entertained, as the council were able to obtain Leicestershire granite, which answered the purpose, at something less than the contract price. The borough engineer now states, however, that it is no longer possible to get a sufficient supply of stone from Leicestershire, owing to the use of the railways for War Office requirements. Granite is urgently required for road reparation works in the borough, and the committee dealing with the matter recommend the council to assent to the payment to the contractors of 1s. per ton in excess of the contract price.

CUMBERLAND ROADS AND BRIDGES.

ESTIMATES FOR THE YEAR.

[illegible] Highways Committee of the Cumberland County Council contain the annual estimate of the county surveyor, Mr. William Finch, for 1915-16. The surveyor states that the estimate for maintenance and repair of main roads, as [illegible] adopted, is more than the [illegible] during the past twelve months. The total estimate for this work—viz., £30,700—was £1,700 in excess of last year, chiefly accounted for by the increase in the resurfacing work necessary on important roads which had hitherto been surfaced with inferior stone. The estimate of £30,700 for ordinary maintenance of rural main roads under direct control gave an average cost per mile, exclusive of surface [illegible] throughout the country. Included in the estimates was the sum of £7,530 for laying tar-macadam in various places throughout the county. This amount was £1,070 less than the amount included last year. The estimated [illegible] towards which the surveyor anticipated the Road Board would contribute £3,165, being 75 per cent. A sum of £600 had been again included for tar-spraying certain lengths of road other than those included in the resurfacing programme, and [illegible] that he anticipated a grant would be made by the Road Board of £300.

With regard to the committee's general scheme of resurfacing with approved materials roads which had hitherto been surfaced with inferior limestone and land or river cobbles, there were several lengths of important roads under this classification which it would be essential to resurface next year, and he had included a sum of £18,471 for this work, £11,771 of which was provided for in the ordinary maintenance estimate, thereby entailing an extra cost of about £6,700, and, as hitherto, he anticipated securing a Road Board grant of probably £5,025, provided that those sections were surface treated with tar, the cost of which would be included in the following year's estimates.

Assuming that the Road Board favourably considered [illegible] the amount to be raised by the county council for the maintenance and upkeep of the rural main roads for the ensuing year would be £37,040 (after deducting the estimated Road Board grants mentioned above and amounting to £8,490), or a total increase on the previous year of £1,328. The estimate, inclusive of all surface improvements, gave an average cost per mile of approximately £80. The total estimated cost for main road improvements was £7,355, towards which he estimated that the Road Board would contribute the sum of £1,403, and after other deductions the nett cost to the County Council was £2,072.

The present agreements for the maintenance of main roads in urban areas expired in March next, and the total amount recommended by the sub-committee for the ordinary maintenance of those roads during the next financial year was £6,671, which was an increase of £371 owing to the increased cost of maintenance experienced by almost all the urban authorities. In addition to this amount, the sum of £2,151 was recommended for the extra cost of laying tar-macadam on the main roads within the urban areas in accordance with the practice of the committee during the last two years. The estimated Road Board grant for this work was £1,611, leaving £540 to be provided by the county council, thus making a total estimated cost of urban main roads, after deducting Road Board grants, to the county council of £7,211. After dealing with various items of general expenditure, the county surveyor estimates that the total nett expenditure during the next financial year on the county main roads, bridge roads, and bridges, including grants to local authorities was £56,254.

A Glossary of Road Terms (By H. Percy Boulnois, M.INST.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

Municipal Engineering.

By NORMAN SCORGIE, M.INST.C.E., Borough Engineer of Hackney.

[Extracts from presidential address delivered before the Society of Engineers on Monday evening last.]

In our time every branch of engineering has become noticeably more intensive, more complex, but municipal engineering has been peculiarly influenced by the aggregation of people in towns, the occupation of whole towns and even groups of towns in particular trades, the modern conditions of transport, and all the other problems that arise from the endless efforts of man to conform to a social environment which is constantly changing, and, of late, changing so rapidly that it seems to have been revolutionised within the five-and-thirty years since I commenced my career in public service.

In these changes municipal engineering has received less relief from specialisation than other branches. Railways and great engineering firms all over the country are introducing more and more specialisation, so that for economy of production and administration brains are being classified and organised as much as labour. But the municipal engineer is denied this relief. Admittedly the larger undertakings, mostly classed as municipal trading, are placed in special hands. The borough engineer is no longer called upon to design a town hall in his spare moments, or to manage a tramway system as a hobby; but this is a limitation on the amount of his work, and not on its range. He must still be architect enough to add to the town hall, or adapt an old one to new uses; he may still have to instal the tramway system, and will certainly be called on for inspiration in any difficulties that arise in its working; he may not have to manufacture gas or electricity, but he has to possess a knowledge of their manufacture and the actual cost of production before he can persuade the gas or electrical engineer to sell them at a fair price for public lighting; he must be something of a bacteriologist to deal with sewage; and more than a little of a lawyer in order to pick holes in the opinions of eminent counsel in matters of public health law; and, finally, in the present year he must be an expert in designing shaded colour schemes for London, and in digging trenches to defeat German howitzers.

Specialisation in Municipal Engineering.

The reasons why municipal engineering has not been specialised are fairly obvious. (I am using this term throughout as a convenient one for civil engineering under local authorities, although they may not be municipalities.) To some extent it may be that a council of voluntary laymen compares unfavourably with a board of paid directors in dealing with administrative reform. It has not the stimulus of trade competition to induce it to take the best advice and the most elaborate pains to effect economies and improvements; and, on the other hand, it has to fear an electorate which, in some instances, is apt to assume that high salaries are necessarily wasteful, and that cheap labour is good labour. But if all this be admitted, it is not a sufficient reason, because the influence of lay control on engineering, whether by public authority or by private directors, is necessarily becoming less as the work of the engineer becomes more technical. The eighteenth century saw the end of the period when a well-educated man might hope for a working knowledge of all professional lore in current use—although, unfortunately, the twentieth century still produces laymen who think they have that knowledge.

The real reason for the difference in this connection between municipal and other engineering seems to me to depend on the nature of the work itself, and the conditions of local government in this country. In commercial engineering a large output is clearly one of the conditions for success, and the impulse to specialise in one particular line can be encouraged, and it is encouraged by studying local resources to such an extent that whole districts are devoted to the manufacture of one particular article; which, as I have already suggested, only increases the difficulties of the unfortunate municipal engineer, who must know the process as thoroughly as the manufacturer himself, in order to make proper sanitary provision for waste products and other special conditions brought about by the trade. Where engineering firms still continue a wide range of output, or where they enter upon new work, such as the armament firms taking up motor-car manufacture, the work is specialised, with separate factories, separately controlled. They may advertise that their motor cars are "built like a Dreadnought," but I venture to question whether the chief naval designer had much to do with them. In the motor-car trade itself, as an example, the tendency is in the direction of specialisation in one design, or, at any rate, a very limited range of models, for each firm. We may deplore this from an uneasy feeling that it will have a paralysing effect on initiative; and we may sincerely hope that it will never attain such dimensions in England as it has in America, so that very obvious errors of design cannot be altered because of the expense of altering machinery dealing with such enormous outputs as one complete motor car every forty seconds. But we must recognise that this tendency is winning on its merits, and endeavour to meet such evils as it brings in its train by striving to improve the status of the engineer so that the designer may have the controlling voice in the factory.

Similarly in railway engineering specialisation increases, although the conditions are different. Railways cannot limit themselves to the carriage of one class of goods, or the design of one type of locomotive, but they can substitute, and are rapidly substituting, delegation for decentralisation. The engineer for the A district and the engineer for the B district are giving place to engineers for this particular work and for that, each over the whole system—such as one for the track only, another for signals and telegraphs, a third for bridges and tunnels.

But local government by small areas makes anything of this sort impossible in municipal engineering. The town council cannot specialise in house refuse, and refuse to scavenge or light the streets, and, on the other hand, it cannot afford, since its area is small, to pay adequate salaries to a number of separate experts. Therefore the municipal engineer is bound to be something of a jack-of-all-trades (although not, I hope, master of none). He must know something of everything and everything of something, be an opportunist, doing his best with the material ready to his hand, hampered on every side by limitations and vested interests. His plant is largely classed as unproductive. His results are increased public convenience and reduced death-rate. They are often very striking, but they are not directly measurable in pounds, shillings and pence; or rather payment is not made directly in those terms to his employers. If a railway engineer can satisfy his directors that a proposed widening will increase earnings, or decrease working expenses by a sufficient amount, they will let him proceed, and if his estimate is sound the board will recoup their outlay and satisfy the shareholders. By elaborate traffic censuses the municipal engineer may prove that a certain road or bridge widening would repay its cost to the public at the very lowest estimate of the loss caused by the present congestion, but (in default of a toll) he cannot produce the money to the town council, or they to the ratepayers.

Municipal Expenditure.

Public expenditure, both national and local, is constantly increasing, and one can see no sign of any check. (I am speaking of the normal conditions before the war.) Old-fashioned ideas of economy have broken down. The public is in revolt against the belief that the spending of money is always an evil to be avoided if possible. There is grave danger that for want of guidance they may incline—indeed they have inclined—to the opposite fallacy that all spending of money as long as it is on public objects is a good thing to be encouraged as much as possible. Ignorant or interested opposition to all municipal enterprise was able to conceal from the public for many years the fact that the value or productiveness of work for the community at large cannot properly be measured in the only term known to private enterprise—a monetary dividend. Now that they

favour are checked by that fraction and the opposition of the company promoting the tramway is discredited. It is naturally difficult to get them to distinguish between the financial and the economical aspects of the case, that municipal work is not as much subject to economic principles as any other form of expenditure. I venture to suggest that every young engineer starting in municipal practice should consider a grounding in the science of economics an important part of his professional training, as it may be some day his duty to advise his council on the economic aspects of any proposal that comes before him, and they may pass on the information to their constituents. Whether it is a new open space or a housing scheme for a slum area, a new system of scavenging, or a new tramway line, or anything involving expenditure within the province of the municipal engineer, it should be possible for him to arrive at the actual gain to the community in terms of money, after making proper deductions for benefits accruing to a particular class only as far as possible under the area of taxation, with a reasonable margin of error, varying according to the information at his disposal, and likely to become less and less if the estimate were properly made in all cases, and statistics accumulated. It is not necessary to extend this return on the capital, good or poor, as the case may be, a perfectly definite thing, although the expenditure may be unproductive in the financial sense. Ten shillings a year saved on the electric bill for each household is as tangible as a ten-shilling reduction in the rate demand note.

I am not posing as an advocate for or against municipal trading, but I am suggesting that the misleading division of municipal expenditure into productive and unproductive is one which the municipal engineer should combat, and in its place he should strive to set up an enlightened public opinion as to the real aims and productiveness of his work. It is public ignorance of the difference in the material results to be expected from it and other forms of engineering which condemns him, on the one hand, to the use of obsolete devices in the interests of so-called economy, and, on the other hand, to embark on unsound schemes for the sake of an immediate profit or saving. It is not possible in the space at my command to elaborate this in detail, but a simple example from the case of a municipal tramway system may illustrate it. Suppose two extensions are proposed—one to an already overcrowded part of the town, the other to a healthy undeveloped part. The first could be worked at a profit from the start, the other not, perhaps, for some years; and yet, if we take into account the decrease in overcrowding and the eventual increase in rateable value, the latter may be the better scheme. Or, again, consider the current assumption that a tramway system in a town of less than 40,000 is bound to be unprofitable. Unless we have carefully considered the extent to which it is patronised, the saving of health in bad weather, the saving in cab fares to the well-to-do, and in time and shoe-leather to the poor, the possible extra employment and increase of population, and many other factors, we are not entitled to make that dogmatic assumption. I do not overlook the factors on the other side that ought to be considered also, particularly the possible unfair incidence of the rate, and the competing claims of the motor bus. I am not trying to solve a problem, but merely to indicate some of the complications in the way of a borough engineer who is honestly striving to make his advice to his council a source of strength and not a string of platitudes.

STATUS.

I have said already that our work, extraordinarily interesting as it sometimes is in its variety, is not work in which one has either the leisure or the inclination for abstract speculation, and I am not going to depart from my own rule except to consider briefly whether the present wide scope of municipal engineering is likely to be a permanent condition.

In recent years it has probably been of some advantage to the profession as a whole that one branch of it should have remained exempt from the increase of specialisation, because specialisation always produces a temporary decline in status. We are apt to value a thing by the price it will fetch, and a man by the salary or fees he can command, and if the work of an engineering post formerly held by one man is split up among several, it is clear that the individual salaries will be smaller and the status of the holders to some extent less than that of their predecessor. It is only a temporary depression, for two reasons: First, if the change is a good one it will lead to such an increase of business that the separate appointments will eventually be worth more than the original one; secondly, and more important, in the case of those firms and public authorities whose work is largely concerned with engineering, the importance of engineering knowledge in high places is becoming more and more recognised, so that, while the purely professional work of a chief engineer may be abolished by the division of it among independent departmental engineers, yet the appointment of an engineer as chief executive officer is becoming usual. The title "engineer and manager" or "engineer and secretary" is now common; even large railway companies have begun to follow foreign example and appoint an engineer as general manager, and under many public authorities (which it would be invidious to mention) the engineer enjoys that most extraordinary proof of status—a higher salary—although the clerk is, by surviving custom or Act of Parliament, the first official.

In any event I do not suggest that this service of unity in a period of temporary disunion, which municipal engineering has done to the profession as a whole, is a permanently valuable one, because I am not among those who think that the status of engineering is permanently at the mercy of anything except the merit of the engineer. One simple safeguard we should have, such as every profession has found necessary for its protection against charlatans—namely, that no one who is not properly qualified should be allowed to call himself an engineer. Beyond that I think we could work out our salvation without the aid of many shibboleths. It may be argued that those professions which by common consent enjoy the highest prestige, such as medicine and law, are protected by elaborate codes of etiquette and internal discipline; but it should be remembered that those codes are late products in professional history. Whatever we may think of their value, they are the devices of a professional class to preserve a position which it has already won on its merits and without their assistance. The lawyer class became influential in England as soon as the legal system developed, because of their superior knowledge of it, and their right of exclusive audience in the courts was the result and not the cause of their influence. And in medicine it is probable that nowadays the surgeon enjoys a slight professional and social precedence over the physician; yet the surgeon is a comparatively new-comer to the medical profession—the common barber promoted. He owes his promotion solely to the merits and exactness of modern surgery. The moral of this on engineering status is important enough to be worth emphasising. It should encourage us to do everything in our power to set a high standard of professional service, and, as the retiring president pointed out in his address last year, of independent service. The value of the doctor's prescription over the patent medicine is partly its independence of trade interest. The barrister has maintained his right of audience when other monopolies have broken down because his services, at his usual fees, are at the disposal of all; he may not refuse a brief or claim a special fee because he does not like a case or a client. These analogies should also save us from depression when we do not see those results which we should like from the activities of this and other engineering societies within the limits of a few years. The village inn-keeper as surveyor of highways some years ago, or even the village cycle-repairer blossoming into the motor engineer of to-day, may seem a low ancestry; but the barber and apothecary was at least as low.

MUNICIPAL FEDERATION.

There are some grounds for suggesting that the exceptional breadth of municipal engineering may pass away, and give place to specialisation to some extent. The co-operation of local authorities for particular purposes has often been encouraged by Parliament. Possibly it is owing to their rather short-sighted reluctance to take advantage of it that the tendency of recent legislation is to ignore the district and the small borough, and make the county and the county borough the only administrative units. There are, however (excluding the main drainage system of London), forty-two joint sewerage boards acting for about 110 local authorities, including such important towns as Birmingham and Brighton.

There are two or three parts of the country in which such population and wealth are gathered together within a limited area that the community could afford to pay for a very considerable amount of special ser-

vice. One of them is London. It finds work for a large number of municipal engineers. In the metropolitan boroughs, where their work is very similar to that of their colleagues in the provinces, and the county boroughs, boroughs and urban districts of Greater London, where it is identical, there are about forty men holding chief appointments, in no way distinguished from one another or from those drawing similar salaries in other parts of the country, yet their collective cost is greater than would seem necessary for London compared with provincial towns on a basis of population, size, rateable value, or even traffic. It is obvious that forty men of similar ability, paid similar salaries, but each a specialist in one class of work, and in charge of that work over the whole of London, would be very much more efficient in themselves at no increase of cost to the public. I am not advocating this as a desirable reform. Specialised efficiency is not popular at the moment because of its supposed identification with German methods, and to say that they would be more efficient in themselves does not prove their ultimate value under popular control. The brain power delivered in the committee room is often heavily reduced by inertia and friction before it reaches the wheels. London suffers from an extraordinary lack of any sense of corporate unity, and, in the absence of that cementing force, it is most probable that local areas under the control of local councils—areas small enough to be conscious of physical unity—in default of anything better, are the best form of government.

Historically the development of London government might have been very different. The ancient city might have extended her boundaries slowly so as to embrace the whole, which would probably have brought about by this time some such system as I have suggested. Alternatively, the outside districts might have been treated less like the cinderellas of local government, and might have adopted a system of federation with better prospects than the Metropolitan Board of Works started with. Federation is the only method of government which the wit of man has yet devised able to reconcile local jealousies with a growing sense of unity. The gradual expansion of the City would have prevented these jealousies arising; but, failing that, it would seem as if federation were the only method by which Londoners could have been brought to believe in London. The creation of a directly elected county council has, unfortunately, only produced twenty-eight examples of the jealousies that commonly exist between any county council and the non-county boroughs within the county. Moreover, it is an inexpansive system. Independent authorities outside a federal scheme will often, in self-interest, elect to come in, but it is impossible to imagine that the boroughs outside the County of London will ever of their own free will come under the control of an external London County Council. Their opposition may postpone the whole question ten or even twenty years, but sooner or later London government will have to be dealt with again, and most probably the next time on federal lines. Federation itself, of course, would not necessarily produce a great amount of specialisation in municipal engineering; but since it almost always leads to closer union, it would probably be a step in that direction.

Municipal federation is also becoming a possibility in other parts of England—for example, in the Birmingham district and in the Manchester district; indeed, in the latter it is almost an issue of current municipal politics.

ROAD MAINTENANCE

But before these tentative influences arising from unity of local interest can affect the profession—that is, the branch of it with which I am dealing—it is likely that another influence, new within the last decade, and arising from a unity of interest all over the country, in urban and rural areas alike, may have a practical effect upon us. I mean the problem of the road. This includes not only the question of road construction and maintenance, but the whole problem of transport, from town planning to traffic regulation.

The advice and complaints of the general public to the road surveyor are no more valuable than other outbursts by "the man in the street" on technical subjects which he does not fully understand. Statements as to the bad condition of roads are often untrue or misleading. The testimony of foreign delegates to the Road Congress in 1913 was that English roads, on the whole, were distinctly superior to Continental ones. This may be discounted, to some extent, as mere politeness to their hosts; but in my own experience, based on considerable road travelling in France and Belgium and in Germany and Austria, no one who has not seen the ordinary condition of the roads which form the suburban approaches to a Continental manufacturing town has any right to call a road bad; and even when a stretch of English road has fallen into a deplorable condition, it is often due to the parsimony or ignorance of the road authority, and not to the incompetence of their surveyor.

But while urging all this it would be idle to deny that for one reason or another road maintenance in this country is a duty which is very unevenly performed, and a burden which is very unevenly distributed under present conditions. The Departmental Committee on Highways (1903) found the roads of England and Wales in the hands of some 1,900 local authorities pursuing widely divergent policies. The recommendations of the committee, which would have introduced a modified nationalisation by Government grants administered through county road boards for the whole of a geographical county (including county boroughs within it) have remained a dead letter through the apathy of the Local Government Board. But with the growing importance of the roads, and their increasing cost, which is now about £15,000,000 a year, and greater than that of any other country, it is inconceivable that any control can long be suffered to remain in the hands, for example, of rural district councils who, in some cases, appoint as their surveyors unqualified persons at salaries as low as £40 a year. Public opinion and recent Parliamentary action seem to be in favour of more centralised control.

The Royal Commission on London Traffic recommended a central traffic board for the whole of the London area, and a reform is none the less a reform because it is overdue. The reasons which led the commissioners to this conclusion for London—namely, the singleness of the object to be attained, and the inability of any existing local authority to command confidence over the whole of Greater London—apply in a greater or less degree to many other large urban areas in the country.

NATIONALISATION OF ROADS

The creation of the Road Board in 1910 is another conspicuous advance in the policy of centralisation, although for the present limited to financial assistance and advisory propaganda. The policy of the board in confining its attentions principally to county main roads may be unfair to the Metropolis, to county boroughs, and to other boroughs and districts in respect to their non-county roads; but a halting or inequitable beginning cannot alter the fact that the nationalisation of the roads has begun. The statutory power of the board to make and maintain roads of their own emphasises this.

Finally, the Government is committed to a policy of fostering co-ordination in regard to town planning schemes, and from fostering to compelling is a short step in twentieth-century political opinion.

All these are reasons for thinking that a very profound change in the position of the municipal engineer may be near at hand. He began as a surveyor of highways; he may likely end as such. If the roads are taken from him the greater part of his daily engineering work will go with them. It is not really a question of taking some roads and leaving others. In urban areas the distinction between the county and non-county road has generally been rather a matter of financial juggling than substantial fact, and what substance there was has vanished with the coming of the motor. The speed of horse-drawn vehicles was so nearly alike, and therefore the loss of time due to congestion so relatively small compared with the total journey, that there was little temptation for a driver to leave the main road for a worse-paved, worse-lighted side route; but with motor traffic there is every inducement to avoid the relatively high loss of time due to congestion. The result is that the so-called side roads may have to bear a great share of the through traffic. Not only pleasure cars seek out such roads, but heavy commercial vehicles also: indeed, the profitable employment of motors for delivery work in particular depends on their ability to maintain a high average speed as a set-off against their great first cost. Even the motor omnibus is taking to the side roads. Those in control of omnibus policy (and there are none shrewder) seem to be satisfied that it is more profitable to run a through, long-distance traffic by [illegible]

in the crowded thoroughfares.

volume and fewer halts. The Roman roads, which

Mr. Norman Scorgie, M.Inst.C.E.
President of the Society of Engineers.

mediate causes of population, have actually led to the most important arteries of the country. In the county of Nottingham a portion of Roman road, derelict but

The existing distinction between main roads and others is most unfair and anomalous. From the decision of the county council as to classification there is no appeal, with the result that enlightened counties "main" all their important roads, whereas others shirk their responsibility, or trifle with it, as a recent example where a county wished to prevent a borough amalgamating with an adjacent urban district to attain county borough size, and was alleged at a Local Government Board inquiry to have "mained" an extensive number of the urban district roads as a bribe to the district to oppose amalgamation, while the revenue for their maintenance came chiefly from the non-county borough.

If a new road engineer displaces the county and the district and the borough surveyor of to-day he will control not only the surface but anything underneath the road. Public opinion is becoming intolerant of the multiplicity of authorities with power to open up a road, and it is difficult to imagine that it would consent to a separation of the highway from the sewerage authority to any great extent. . . .

The road problem seems to have attained the all-engrossing position in municipal engineering that one pictures the battle of the gauges occupying in railway engineering in the forties. The available literature of recent date is truly formidable, but very accessible. I could contribute nothing personal to-night which I have not contributed to recent discussions here and elsewhere and to augment the mass of literature would be a valueless task (even if within my powers) in such a case as we are in a transition stage in which we want evidence, not conclusions. The cry is for a new Macadam; but Macadam spent thirty years in detailed investigation before he

temperament as represented on our highway authorities is one of profound distrust of scientific investsurveyor is sometimes told to stick to old and tried methods even after they have been tried once too often and failed. In order to secure the laying of a in its stability. This, of course, is another argument authority with a small revenue to whom an unfortu-

Mr. Scorgie closed his address with some observations on the administrative system under which municipal engineering has developed to its present important position.

Among those present at the meeting of the Society at which the foregoing address was delivered on Monday evening were Messrs. H. C. H. Shenton (retiring president), C. H. Cooper, borough engineer of Wimbledon, T. Cole (general honorary and consultant secretary to the Institution of Municipal and County Engineers), A. E. Darby, borough engineer of Bethnal Green, Wm. Fairley (Westminster), W. H. Grieves, surveyor to the Sutton, Surrey, Urban District Council, Percy Griffith (Westminster), C. J. Jenkin, surveyor to the Finchley Urban District Council, E. B. B. Newton, borough engineer of Paddington, F. Sadler, engineer and surveyor to the Acton Urban District Council, W. Noble Twelvetrees (past-president) and H. T. Wakelam, county engineer of Middlesex.

PRESENTATION OF PREMIUMS.

The premiums awarded by the council for papers read at meetings and published in the Journal during 1914 were presented by the retiring president, Mr. H. C. H. Shenton, as follows:—

The President's Gold Medal to Mr. A. S. E. Ackermann for his paper on "The Utilisation of Solar Energy."

The Bessemer Premium, value £5 5s., to Mr. A. Stewart Buckle for his paper on "Cylinder Bridge Foundations in the East, and the Construction of the Sittang River Bridge, Burma Railways."

The premium, value £3 3s., for members of affiliated societies, to Mr. R. H. Cunningham for his paper on "Irrigation in India."

A Society's Premium, value £2 2s., to Mr. James Tonge for his paper on "Some Uses of the Hydraulic Mining Cartridge."

VOTES OF THANKS.

A vote of thanks, proposed by Mr. Norman Scorgie, seconded by Mr. W. Noble Twelvetrees, was unanimously accorded to the retiring president, Mr. Shenton, for his services during the past year. Mr. W. B. Esson afterwards proposed, and Mr. Percy Griffith seconded, a vote of thanks to Mr. Scorgie for his address.

THE SOCIETY OF ENGINEERS' NEW PRESIDENT.

Mr. Norman Scorgie has been elected president of the Society of Engineers for the ensuing year. He commenced his professional career under Mr. R. Read, the city surveyor and waterworks engineer of Gloucester. In 1881 he went to England to the borough engineer of Leicester, being appointed four years later resident engineer on the town's flood prevention scheme. In 1886 he was promoted to the position of senior engineering assistant and resident engineer on the new main drainage works, and he superintended, under successive borough engineers, the construction of the whole of the work, with the exception of the first contract, comprised in the engineership of the late Joseph Gordon, which cost £100,000 or more. In 1891 he was appointed engineer and surveyor to the Metropolitan Vestry of Rotherhithe, his appointment to Hackney following five years later. Mr. Scorgie is a member of the Institution of Civil Engineers, and a member of council of the Institution of Municipal and County Engineers.

PROBLEMS IN MODERN ILLUMINATION.*

By Valentine H. Mackinney.

It is not such an easy matter to say exactly in what good lighting consists. There are, it is true, certain fundamental requirements that must be met. The lights should be sufficient. In an office or workshop, for example, we must provide enough light on the work to enable the workman to do his task in comfort, or the clerk to read and write with perfect ease. We must also provide sufficient general illumination in the room for all surrounding details to be clearly visible. But only long experience can show exactly how much light is needed for different classes of work; and only the skill of the trained lighting expert can secure that in any installation this correct amount will be provided. The illumination should be just right. Too little would be a hindrance to the worker, and therefore uneconomical, too much would be waste.

Another fundamental rule is that the light should be directed where it is needed. This implies two things—that the lights are arranged in the correct positions, and that the lamps are provided with the correct shades or reflectors, screening the light from the eyes of workers and directing the rays just where they are required. Proper shading, in fact, is one of the first requisites in successful illumination. It is not enough merely to provide a bright light. An unshaded source, throwing the light right into the eyes of the worker, instead of on the work he is doing, is a constant source of annoyance; it may even be worse than no light at all. For instance, glaring lights among scaffolding and at the heads of staircases have led men to stumble and thus actually caused accidents.

There are, of course, many special points to be considered. The light should come from the right direction, the shadows should be just right, neither too soft nor too hard, the glassware or metal used with the lamps should be suited to the surroundings. But all these requirements can be met by the trained illuminating engineer.

INTRINSIC BRILLIANCY.

The unpleasant effect of bright light sources in the field of vision is now termed "glare." The glare from an illuminant so used is mainly a function of the "intrinsic brilliancy" of the light source, usually expressed in "candle-power emitted per square inch of projected area." The following table is of interest as showing the intrinsic brilliancy of various modern sources:

Table for Intrinsic Brilliancy for Various Light Sources Now in Use.

Light source	Candle power per sq. in.
Moore tube	0·3—1·75
Frosted electric incandescent lamp	2·5
Candle	3·4
Gas flame	4·8
Oil lamp	7·8
Cooper-Hewitt lamp	1·7
Welsbach gas mantle	20—30
Acetylene burner	75—100
Enclosed A.C. arc lamp	75—200
Enclosed D.C. arc lamp	100—400
Electric lamps—	
Carbon 3·5 watts per candle	475
Carbon 3·1 watts per candle	480
Gem 2·5 watts per candle	625
Tantalum 2·0 watts per candle	750
Tungsten 1·25 watts per candle	875
Tungsten 1·0 watt per candle	1,000
Tungsten half watt	1,600
Sun on horizon	2,000
Flaming arc lamp	3,000
Open arc lamp	4,000—5,000
Open arc crater	100,000
Sun 30° above horizon	500,000
Sun at zenith	600,000

The brightness of the average white sky is about 2·5-candle power per square inch, and many authorities consider that the objects in an artificially lighted room should not be brighter than this.

VARIOUS METHODS OF LIGHTING.

Lighting may be classified in three methods—direct, semi-indirect, and indirect. Of the three, semi-indirect might be considered as the ideal, as with this form one gets the advantage of soft shadows and diffused lighting without the disadvantages of harsher shadows in direct lighting, and the peculiar upside-down or "well effect" of indirect lighting. The "well effect" is more noticeable with indirect lighting should the walls be darker, as one sees the very bright ceiling and dark lower portion of the room. A practical example of this is in the lecture-room of the Institution of Electrical Engineers, London, where the room is lit by concealed cornice lighting, and the walls are of dark mahogany panelling.

For fine work local direct lighting is essential. In connection with libraries, reference-rooms, where one would sit and study at length, local direct lighting is required, while for reading-rooms good general illumination is best, as one would wish to read in comfort, holding the book in any position without obtaining harmful shadows.

In the case of rifle ranges, even lighting of the targets is essential. Should one target be better lit than another it would give competitors undue advantage, and also in this case the lights must of necessity be obscured from view, as any glare would be greatly detrimental to the marksman.

REFLECTION VALUE OF SURROUNDINGS.

In calculating illumination value it is necessary to take into account the effect produced by the light reflected on to the working plane by the surrounding objects. It is quite possible to obtain an increase of as much as 80 per cent in the illumination on a horizontal plane when the room is small and the surroundings light. Speaking broadly, the increase in the actual illumination is as follows:—

Condition of ceiling.	Condition of walls.	Increase over calculated illumination.
		Per cent.
Very dark	Very dark	0
Medium	Very dark	15
Medium	Medium	40
Very light	Very dark	30
Very light	Medium	60
Very light	Very light	80

In very large rooms the effect of reflection from the walls would be less important, although ceiling reflection must be considered. In large spaces, however, the decreased importance of wall reflection is to some extent counterbalanced by the effect of distant light units, their tendency being to improve both the average intensity and the uniformity.

In conclusion, the following simple rules should be observed:

Don't work in a flickering light.

Don't expose the eyes to unshaded lights in the direct range of vision.

Don't judge illumination by the brightness of the lamps.

Avoid extensive contrasts.

Use the right type of globe, shade, or reflector.

Make sure that the illumination is sufficient.

Keep lamps, globes and reflectors clean.

Make sure that lamps are in the right position.

* Extracts from paper read at a meeting of the Institute of Sanitary Engineers on Wednesday evening.

Dangers of Tarred Roads. As the result of a campaign against tarred roads in the Peak district of Derbyshire an influential committee has been appointed to formulate suggestions with a view to placing them before the authorities. The movement is being supported by all the principal farmers and horse-owners in the district, many of whom are stated to have suffered greatly through the condition of the roads.

The Proposed Road from Gower to Penclawdd.—At a meeting of Swansea Rural District Council recently the clerk presented a report of a joint committee of the Swansea and Gower District Councils respecting the proposed road from Gower to Penclawdd, estimated to cost £7,400, towards which the Swansea authority is to contribute £3,000. A committee was appointed to carry through details and application for a grant is to be made to the Road Board.

London County Council Motor Ambulances. The London County Council motor ambulance service was inaugurated this week by the opening of the Fulham station, which will serve the western district of the Metropolis. The need for an up-to-date ambulance service has been a subject of discussion for some time, and in initiating the new service the county council are following the example of the City, which for several years has enjoyed an admirable electric ambulance service. It is intended that in a short time the service will be extended to every district of the Metropolis.

Institution of Municipal and County Engineers.

NORTH-EASTERN DISTRICT MEETING AT DONCASTER.

A meeting of the North-Eastern District of the Institution of Municipal and County Engineers was held at Doncaster last Saturday afternoon. The proceedings, which took place at the Mansion House, were well attended, those present including Messrs. W. J. Steele (Newcastle-upon-Tyne), district chairman, who presided, W. E. H. Burton [illegible] Dearne), W. Fowlds (Keighley), T. Peirson Frank (Newark-on-Trent), Geo. Gledhill (Batley-with-Hexthorpe), W. J. Hadfield (Sheffield), T. H. Hailstone (Birstall), H. Holmes (Ossett), J. D. Kennedy (Retford), A. G. Kilner (Wetherby), F. O. Kirby (Doncaster), C. Lund (Cleckheaton), E. B. Martin (Rotherham), Frank Massie (Wakefield), J. Nuttall (Woodlesford), C. E. Rivers (Harrogate), Leslie Roseveare (South Shields), A. Rothera (Liversedge), F. J. Thrackray (Hoyland Nether), J. P. Wakeford (Wakefield), hon secretary, and C. F. Wike (Sheffield), members; H. P. Foster (Leeds), A. E. Loach (Wakefield), [illegible] borough) and W. A. Walker (Doncaster), students; [illegible] land), visitors.

[illegible]

The [illegible] Mr. E. B. Martin, Mr. Steele, were mixed with a certain amount of [illegible] entered on the minutes.

Mr. [illegible] unanimously.

Mr. [illegible] valued very much the congratulations of his fellow [illegible]

AN APPLICATION FOR MEMBERSHIP.

The CHAIRMAN said he wished to bring before the meeting a matter which involved a matter of principle—an application by a certain gentleman for election as a member of the institution. The applicant at present held the position of a building surveyor and inspector of nuisances under a small urban council, and was in the difficulty that he knew of no one to support his candidature. He was educated at a good school, and he had had a training in an office. His (the chairman's) own view was, if they did not wish to keep down merit, that it was not at all necessary for a man to go through a period of articles if he was a good man otherwise. If a man by his work and intelligence had placed himself in a position to be equal, or possibly superior, to a man who had gone through that period, he did not think they should stand in his way. But the question in that particular case was whether a man who had apparently no other training than that of a building surveyor ought to be a member of the institution.

Mr. E. B. MARTIN (Rotherham) said the council were continually getting applications of this kind, and he suggested that the applicant should be advised to communicate direct with London without troubling about signatures in support of his candidature.

It was resolved that the district secretary should advise the applicant accordingly.

The meeting afterwards proceeded to the consideration of the following papers:—

NOTES ON EXTRAORDINARY TRAFFIC

By F. OSCAR KIRBY, M.Sc., ASSOC.M.INST.C.E., Borough Surveyor, Doncaster.

Despite the change that has taken place in the methods of transport on highways, the percentage of self-propelled vehicles to the total volume of traffic is still comparatively small, and the difficulty has still to be faced of constructing roads which will serve effectively for every kind of traffic.

The damaging effect of traffic is so variable that it is impossible to construct any one road crust suitable to all classes, except at a prohibitive cost, and even then the damage caused by traction engines with barred and studded wheels greatly increases the cost of maintenance. The use on highways of barred and studded tyres, cogged horseshoes, and sharp metal edges has become so common that any suggestion of their prohibition cannot be entertained.

Excessive damage is often done to the surface of highways by the skidding of wheels, which rarely takes place in the case of flexible-tyred wheels, but is the generally adopted method of braking metal-tyred wheels when descending a decline. With a skid-pan the damage is much greater than if a suitable foot-brake were used, which allows the wheels to rotate without skidding. It is well known that the wear on the down-side of an incline caused by [illegible]

Mr. F. [illegible] A.M.I.C.E. ASSOC.M.INST.C.E.

Mr. [illegible] was educated at [illegible] Grammar School. He was articled to his father, the present borough [illegible] and later, after [illegible] engaged as one of [illegible] he was for [illegible] two years assistant [illegible] the late Mr. W. H. [illegible], C.E., and following the latter's death was elected to succeed him in 1906. He has since been responsible for the carrying out of many important public works. Mr. Kirby is a Master of Science of the Victoria University of Manchester, and of the Leeds University, he is also an associate member of the Institution of Civil Engineers, and a member of the Institution of [illegible] and [illegible] Engineers, and of the Institution of Water Engineers.

while on inclines traversed mostly by flexible-tyred wheels the greatest damage takes place on the upside.

The use of a highway in a manner and for purposes for which it is not adapted may cause abnormal damage and wear, and may amount to a nuisance punishable on indictment or restrainable by injunction. Until 1878 a highway could with impunity be subjected to excessive and wholly abnormal wear, provided that a public nuisance was not caused, and by persons not even ratepayers, who might be carrying on business for private gain.

Sec. 23 of the Highways and Locomotives (Amendment) Act, 1878, gave power to local authorities to recover the amount of excess expenditure incurred [illegible] extraordinary traffic, or to enter into an agreement for the payment of a composition in respect of such weight or traffic.

Sec. 12 of the Locomotives Act, 1898, limits the period for the commencement of proceedings for recovery to within twelve months after the damage has been done, or for works extending over a long period to within six months from completion of the work.

I propose to refer very briefly to the working of the provisions of the Highway Acts with regard to extraordinary traffic. It is a subject which has been responsible for a veritable sea of litigation, and many and conflicting legal decisions, and at the present moment the difficulties that govern the question are as great as ever.

In growing districts it is a common occurrence to

see a road cut up for miles by the passage of traction engines in wet weather, or just after a frost, but the difficulty of fixing the blame on any particular train of wheels and bringing the case home to the party responsible is one which often precludes the local authority from taking any action. Similarly, the effect of a traction engine on a newly surfaced length of roadway may, in a single journey, give rise to considerable expense in restoration, which, with care, might have been avoided.

In view of the changing character of road traffic and the legalised use of traction engines and heavy locomotives, it becomes increasingly difficult to determine what constitutes excessive weight or "extraordinary traffic" within the meaning of the Act of 1878.

Locomotive traffic in itself is not necessarily "extraordinary," and it becomes a matter of extreme difficulty to show that an increase in the cost of repairs to a particular length of road is due to the advent of a certain form of traction, and is not accounted for by any other cause. Again, the variation in the standard of traffic due to development of a district is a factor which renders so-called "extraordinary traffic" extremely elusive.

The various judgments given do not make for clearness. While in one case the "frequent and incessant use of a highway" is deemed to be extraordinary traffic, a learned judge in another case ignores the aggregate of the weight of traffic and reduces the question to a consideration of the conditions under which the weight is carried and the proportion in which it is distributed.

The certificate of the surveyor is necessary as a condition precedent to litigation. This should state that extraordinary expenses have been incurred by reason of damage caused by excessive weight or extraordinary traffic.

The schedule to the certificate should set forth the actual expenses of repair to the roads concerned, with a deduction of the average expenses of the repair to roads in the neighbourhood.

It is presumably within the discretion of the surveyor to make such allowances as he thinks equitable for ordinary expansion of the district and the resulting additional traffic.

The nett total in the schedule is the local authority's claim either upon legal proceedings being taken, or may be adopted as the basis for prior settlement by agreement.

One of the difficulties with which the surveyor has to contend is that he has not always a means of ascertaining when the damage is first commenced. The best course appears to be to take action in all cases as soon as practicable, and to submit the first certificate within such time after the damage is noticed as will enable legal proceedings to be begun before the expiry of twelve months from the date of the commencement of the damage.

The certificate should state the name of the party by or in consequence of whose order the extraordinary traffic has been caused. This, too, may be a difficult matter to determine. The local authority may proceed against the contractors, or even the haulage contractors, but it would appear to be most desirable to proceed against the principal person by whose orders the extraordinary traffic or excessive weight has been conducted.

The claim may be challenged or met, or if the damage is being caused by a particular contract or work extending over a protracted period, proceedings may be delayed to within six months after completion, by mutual consent, always provided that the responsible party furnishes satisfactory details as to the nature of the work in hand. This will avoid several cases being taken on the same matter, but the surveyor should submit half-yearly to his council bills, signed certificates and schedules which may be passed on by the council to the party responsible; and payments on account of the damage may be received during the time the work is in progress, subject to settlement on completion of the work or cessation of the damage.

It is important for the surveyor's certificate to be in time for proceedings to be commenced within six months after the cessation of the damage, and particular care must be taken to ascertain correctly the date on which the traffic causing damage actually ceased.

It may be that more than one party are causing extraordinary traffic to pass along the same roads, and it is necessary in such a case for the damage to be analysed and apportioned between the parties liable. This necessitates a careful record of the traffic being taken, of the reputed weight of all vehicles passing, the nature of the contents, and by whose orders the material is being conveyed. In the case of legal proceedings, such a return is necessary to show that the apportionment of the damage is just and reasonable.

There is one form of extraordinary traffic which is particularly rife at present, in consequence of the military occupation of certain districts. Every other cost incidental to the concentration of the Imperial Forces and the movements of troops to various centres is a charge upon the Imperial Exchequer, and it would appear to be invidious to charge the extra cost of maintenance to the ratepayers, who are already victimised merely because their district affords a convenient military centre. It would, however, be untimely, if not distasteful, to take any action in the present crisis.

With the enormous increase of extraordinary traffic during recent years, various suggestions have been made from time to time to facilitate the recovery of expenditure under this head. The remedy generally presumes the possibility of an agreement being entered into before the extraordinary traffic takes place, whereas in actual practice the existence of extraordinary traffic becomes evident only when damage to the roadway is an accomplished fact.

There is always a further difficulty in taking advantage of the proviso to sec. 23 of the 1878 Act, as it is necessary to assume the mode of conducting the traffic and the probable weather conditions in order to estimate the anticipated expenditure. In such a case, to do justice to the highway authority it is imperative that any agreement should be made subject to adjustment of the amount payable, in view of the probability of altered conditions arising. Generally a contractor will refuse to enter into such an agreement, and will rather take the risk of legal proceedings.

In view of the present impracticability of making roads sufficiently strong to withstand any kind of traffic, it is important that a concise record be kept of the expenditure, character and effects of traffic, weather conditions and other details, including the condition of the surface and sub-crust in respect of all roads. By this means it may be proved conclusively that the difference in cost of maintenance of the roads before and after the traffic in question comes upon them is a material amount, and that the extent of the repairs is reasonable. The method of collecting evidence and of keeping accounts is a matter of extreme importance, and it would be well if some standard form were adopted.

Until power is sanctioned by Parliament to define extraordinary traffic as to nature and quantity, there does not appear to be any possibility of providing any simpler or more effective way of protecting the ratepayer than by the present cumbersome procedure. In the meantime, every eventuality must be prepared for, and much useful work may be done, first, in so regulating heavy traffic that it shall not cause damage; and, secondly, if damage be caused, by being in a position to recover compensation in such cases.

If anything can be done by amendment of the law in regard to extraordinary traffic to facilitate the recovery of expense with which local authorities are saddled, and to render less difficult the task of those responsible for highway administration, it is desirable that the powers that be, and in particular this institution, should take the necessary steps without delay.

There exists the probability that traffic which today may be proved to be extraordinary traffic will become by usage and local conditions ordinary traffic; and it is the duty of a local authority (while protecting the ratepayer) to avoid the danger of employing the legal weapons available to the point of arresting development and progress of its district, and possibly of its industries.

DISCUSSION OF MR. KIRBY'S PAPER.

The Chairman (Mr. W. J. Steele) said that generally speaking, he was not at all in favour of interfering in the slightest degree with industry. Even if the traffic of a district did cost the local authority something, they ought not to put any obstacles in the way of the development of local manufactures. There were certain trades that had been harassed a little too much by local authorities—and certainly in that respect. He thought the law on the subject was this: That they could only charge a person for extraordinary traffic if he were doing something of a

temporary nature, but that if he were developing a colliery or mining they could not charge [illegible] extraordinary work. He thought that reasoning was very sound, for if there were no [illegible] there would be no authority and no people to maintain. Subject to there being no interference with industry he agreed there should be some alteration in the law by which a charge could be levied.

Mr. FRANK MASSEY (Wakefield) said he had had cases in which he had perhaps omitted the matter, and enabled them to come to amicable settlements. They had had others in which there had been faults on both sides, and cases which ought to have been settled, but which owing to a settlement not being arrived at, had involved loss to both parties. It was very uncertain, however much one claimed whether one would get what one was entitled to. Generally speaking, it was the usual practice for people to make claims high on the chance that they would get a certain proportion awarded them, and possibly costs—and the costs in that sort of thing should weigh very heavily in the case. He remembered one case in which they claimed £1,500. He would not say that they ought to have claimed that much but it cost them that much always what the average annual cost had been for five years. Mr. Kirby put it that it might be presumed that the road, after it was repaired, was going to be in a very much better state than before. On the other hand, it might be contended by the local authority that they did not want such a strong road, and that there was no necessity to have it strengthened. If, however, it was a road that was going to be more extensively used, he thought it was only fair that the authority should say: "We have now a better and stronger road that will serve us better in the future, and therefore there should be a reduction in the amount to be recovered." One always had the highest respect for the judges who sat to hear these cases, but whether a claim was going to be successful depended to some extent on the judge one came before. He remembered in one case before counsel had a chance of saying anything the judge asked: "Who are these people? What is their rateable value? Don't they pay rates and employ a large number of men? Are you not trying to hamper the trade of the district?" Finally, he said the action of the local authority was most iniquitous, and, of course, they lost. Counsel put their heads together, and they got compensation by consent for £200, the whole of which was swallowed up in costs. Before they had any idea of litigation they had invited the defendants to meet them and discuss on the ground what could be done for the restoration of the road. Counsel, however, did not bring out that point, otherwise the judge might not have said what he did. With the greatest respect for the bench, he thought the tribunal before which such matters came should be altered altogether. He thought a small tribunal composed of practical men not interested in the district at all—practical engineers or surveyors—would be able much better to come to a decision as to the amount of damage actually done. In the opening paragraph of his paper Mr. Kirby had said that, despite the change that had taken place in the methods of transport on highways, the percentage of self-propelled vehicles to the total volume of traffic was still comparatively small. He thought Mr. Wakeford would agree with him that their eyes were opened very much by a census they took at a recent date as to the traffic entering and leaving Wakefield; the weight of the traffic put a very different complexion on the matter. Of course, they agreed with Mr. Kirby that damage was very often done in wet weather just after a frost. Then as regarded the expense of repair, he had tried to point out on the one hand that it was not fair that the authority should have a much better road, but, on the other hand, that it was equally unfair that the amount of damage should be assessed on the average cost of the repair of the roads in the neighbourhood. He was quite in accord with the chairman as to not trying to stop industry, for, after all, the West Riding of Yorkshire lived on the industry created within its borders. Nor did he think it would be wise to push on to the military authorities any large expenditure on account of extraordinary traffic, for the shopkeepers were going to reap the benefit of the increased trade which the military occupation of a district brought.

Mr. W. J. HADFIELD (Sheffield) stated that in his city they had weights up to 100 tons on four wheels passing over their roads. In one thoroughfare they laid a tar-macadam centre along the road, and this withstood quite well weights such as he referred to. [illegible] ment by which they were enabled to make a charge. In Sheffield they kept a record of the cost of every street from the time traffic first went on to it, and if they could afford to do it he thought smaller authorities could do the same. Personally he should not care to make an application to a court without [illegible] been. He agreed, having regard to the trade that resulted, that it was best to say nothing as to the damage caused by military traffic.

Mr. H. P. FOSTER (Leeds) observed that, although in large manufacturing centres heavy traffic was not regarded as "extraordinary," it caused an extraordinarily large expenditure. On one road in Leeds, over which wagons drawn by traction engines passed between certain works, they had found, on taking up the tramway setts, that they had all crumbled to pieces, and were of no further use. They had now, [illegible] it was hoped that they would be able to carry that traffic along the tramway lines by making a junction with the works at each end. It was hoped that they would make a reasonable profit out of the traffic, while saving the works something in the cost of transport. They could deal with the traffic at roughly 4d. per ton-mile.

Mr. J. P. WAKEFORD (Wakefield) said he agreed with the remarks of the chairman as to the inadvisability of crippling the industry of a district. They had had a considerable amount of damage done to setts in their district, but the council, as a rule, did not take any great account of it.

Mr. W. FOWLDS (Keighley) spoke of the damage done to a little side road by a traction engine engaged in transporting a fair. The matter was taken up, but they got nothing out of the proprietors. He thought that was a case in which they ought to have been paid something.

Mr. L. ROSEVEARE (South Shields) said that in his town they had anything up to twenty horses drawing castings along the roads, and in spite of the damage caused by such traffic he would not advise his council to take any action, regarding the traffic as vital to the interests of the town, and one which they should encourage. From experiments which he had carried out he had found that by bedding setts in sand and jointing them with Plascom they did not get the crushing that occurred when the setts were bedded in sand and jointed with cement. He agreed that [illegible] own case he could say to one halfpenny what had been the expenditure on haulage, labour and materials on every road.

A vote of thanks was passed to the author of the paper.

Mr. KIRBY, in the course of his reply, said he quite agreed with the chairman as to the desirability of not interfering with industry. He thought that the law generally as to heavy traffic wanted widening and consolidating. One of the speakers had suggested a single arbitrator instead of a judge, but the difficulty was that the arbitrator would require to have seen the road before and after the damage was done. It was really not worth going to law, because one never got what one asked for. He took it that in adopting tar-macadam for heavy traffic the desire was to secure a resilient paving. As to traction engines versus tramways, the conveyance of material at 4d. per ton-mile seemed very cheap.

THE ORPHAN FUND.

Before the close of the proceedings the CHAIRMAN stated that recently, after examining the last balance-sheet of the institution Orphan Fund, he had drawn the attention of the hon. secretary of the fund to the fact that the income was very much greater than the expenditure. Mr. Rowson, in reply, had admitted that that was a fact on paper, but that there were a good many cases they would have liked to help but for the lack of funds; and another important point was that they were attempting to create a fund which, by the interest that would accumulate, would in time become permanent, and make it unnecessary to rely on the collections which were made at the different meetings.

A collection for the fund realised £1 10s. 9d.

The members were afterwards entertained to tea by the Mayor, to whom a cordial vote of thanks was passed for his hospitality.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for January is awarded to

Mr. E. W. PUGH,
Fernside, Handel-road,
The Polygon, Southampton.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

454. Foundations. What should be the composition of concrete for the foundations of a factory chimney stack? Would lime concrete be suitable? (Ajax.)

455. Testing Materials.—Give an outline sketch of a testing machine for tension tests of steel. (Inquirer.)

456. Strength of Materials.—A rectangular beam is loaded by a weight at its centre. How will the deflection be changed by (*a*) doubling the span, (*b*) doubling the width, (*c*) doubling the depth, or (*d*) doubling the load?

457. Hydraulics. [illegible] Explain carefully the [illegible] be varied [illegible] on the right-hand side of the [illegible] and [illegible] the velocity of [illegible] have been determined.

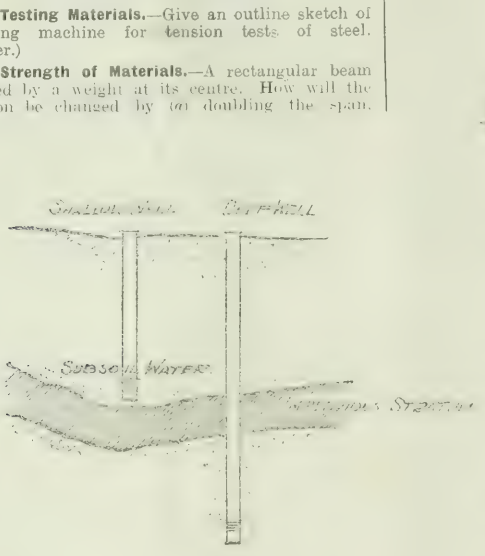
458. Fireproof Construction.—Give sketches of [illegible]

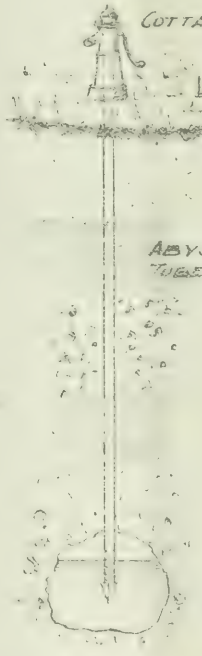
[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

452. Wells.—What are—(1) A deep well, (2) a shallow well, (3) an artesian well, and (4) an Abyssinian well? Give definitions. (G. C., *Wigston Magna.*)

Well [illegible] Deep wells [illegible] shallow wells. Deep wells are those which obtain their supply by tapping the water-bearing stratum beneath the impervious stratum, while shallow wells rely on subsoil water for their supply. Of course, shallow wells may be much deeper than some "deep" wells. Artesian wells are bored, whereas common wells are dug. The water in artesian wells, or borings, will rise approximately to the height of the point of supply, which may force the water above the ground level, thus reducing the amount of pumping required. Artesian wells derive their name from the province of Artois, in France, where they were first used. Abyssinian wells are "tube" wells, generally used for temporary supplies. They are formed by driving first a tube with a pointed end, and perforated holes near this point into the ground, and





[illegible]

453. Building Construction. Draw a section showing the construction of a flat asphalted roof, carried on timber joists 10 in. by 2½ in., resting below the wall to be of 14 in. brickwork, surmounted by a 9 in. parapet, 2 ft. high, coped with stones, the section to run across the joists and through the parapet walls. ("Ajax.")

The drawing on the opposite page is submitted in answer to this question.

Institution of Civil Engineers.—At a meeting to be [illegible] Mr. F. Dixon Evans, [illegible] will read a paper on "Municipal [illegible] Matters." The [illegible] will take place [illegible]

CORRESPONDENCE.

THE MANUFACTURE OF CONCRETE TUBES.

To the Editor of THE SURVEYOR.

SIR,—Referring to [illegible] on the 16th ult. of the paper on the Application of Concrete in Modern Sanitation read by Mr. Henry J. Tagg, A.M.I.C.E., Mr. Tagg stated in his paper that some years ago at the request of the Corporation of Leicester he carried out experiments with a view to ascertaining whether concrete tubes could be satisfactorily made in the moulds by the application of heat, and that as the result of these experiments he arrived at the conclusion that it was not advisable to do so. The president, Prof. Henry Adams, remarked that on several occasions he had heard Mr. Tagg's views on the matter, and at the time of the discussion we thought it would be well if, through the medium of your valuable paper, we could [illegible] tubes in the moulds by artificial heat. Some time ago we obtained the highest expert advice upon this subject, and the report entirely confirmed our own opinion—viz., that drying concrete tubes by artificial heat is destructive to the nature of the cement.—Yours, &c.,

JOHN ELLIS & SONS, LTD.

February 1, 1915.

SAFEGUARDS AGAINST ENTERIC.

To the Editor of THE SURVEYOR.

SIR,—In the introduction to "Municipal Engineering, 1914" [illegible] Special Article [illegible] January 29th [illegible] say that the comparative immunity from enteric of our little Army in France is due to the effective treatment of drinking water by modern plant. Should not this be qualified by a reference also to the wonderful efficacy of inoculation as a preventative?—Yours, &c.,

GERM MAN.

February 1, 1915.

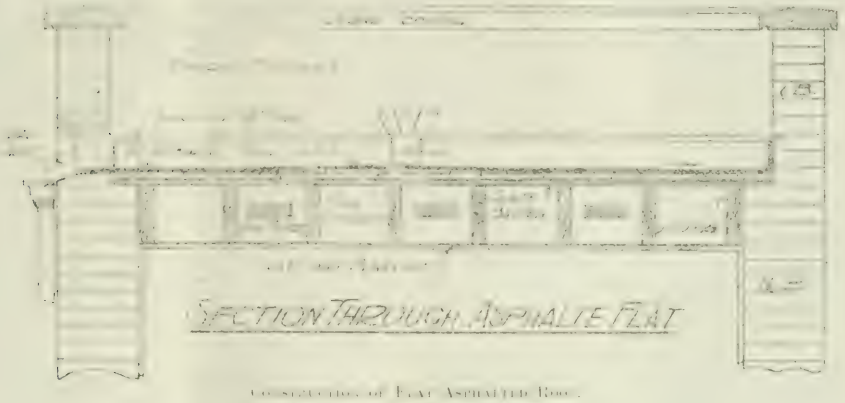
Worcester Sewage Works.—The Worcester City Council on Tuesday, acting on the Water and Sewerage Committee a letter received from the Local Government Board stating, in regard to the sewage disposal works, that the reports received from the experts consulted showed clearly that the works were not being used in the manner for which they were designed and as accepted by the board; and further that the method in use was not one which could be expected to produce satisfactory results. The board were of opinion that the sewage should be properly treated in tanks before it was passed to the filters, and that the tank liquor should be properly distributed over the surface and allowed to flow downwards through the filters. The board reminded the council that by a resolution of August 1st the latter pledged themselves to carry out such works as would be satisfactory to the board. In the circumstances the board called upon the council to carry out the undertaking in their resolution without delay.

STEWARTS AND LLOYDS, LIMITED.

[illegible] Stewarts & Lloyds, Limited, issued the following circular to their customers:—

"Certain misconceptions appear to have arisen in [illegible] the nature and [illegible] German interests in the Clydeside Tube Company, Limited, which is controlled and managed by Stewarts & Lloyds, Limited. In order to correct any [illegible] we desire to put the following facts before you.

"The Wittener Stahlrohren Werke Gesellschaft [illegible] have been for [illegible] years makers of seamless steel tubes for a number of years according to various patents and processes, the property of that company and of Mr. Heinrich Stuting, their engineer, and have [illegible] and a large [illegible] in the United Kingdom. With this fact before us in 1911 [illegible] that we should [illegible] that [illegible] with the [illegible] in this country.



CONSTRUCTION OF FLAT ASPHALTED ROOF.
(See Advertisement Section, page [illegible].)

"Having regard to the experience acquired by the Wittener Company and Mr. Stuting, both in the construction of the special plant required and in the processes of manufacture, we considered it advisable that the arrangements to be made should be such that the experience of the Wittener Company and of Mr. Stuting would be secured in the practical development of the new venture. This could not have been done by a payment in cash, and accordingly, instead of trying to purchase outright the patents and processes and Mr. Stuting's experience and services, we formed the Clydeside Tube Company, Limited, with a capital of £175,000, divided into 175,000 shares, of which Stewarts & Lloyds and their nominees hold one half, and the German company, Mr. Stuting and nominees the other half, and the [illegible] £62,500 [illegible] paid to the German [illegible] on account of their holding.

"Notwithstanding the equal division of shares, the Articles of Association secure to Stewarts & Lloyds the perpetual control and management of the company by provisions as to voting at directors' and shareholders' meetings and as to general management. Needless to say, all the information required with regard to this company under 'The Trading with the Enemy (Amendment) Act, 1914' [illegible] market to the Custodian [illegible] Stewarts & Lloyds [illegible] on his appointment, and apart from [illegible] add that shortly after the outbreak of war we informed the Imperial authorities fully as to the whole position. So far as Stewarts & Lloyds are concerned we may state that with over 4,000 shareholders there is only one [illegible] German nationality, and his holding is £600."

Tar-painting in Norfolk.—Owing to a clerical error—which did not arise in this office—it was stated on p. 174 of our Special Annual Issue that 780 miles of roads in the county of Norfolk are to be tar-painted during the next financial year. The figure should have been 120.

The Urban Land Problem as it Affects Town Planning.*

By Professor S. D. ADSHEAD, F.R.I.B.A.

Few problems connected with town planning are more complex than those concerned with the acquisition and utilisation of urban areas. At the outset we are beset with a tangle of legal issues which, controlling as they do all progress in urban development, must be dealt with. All who hold public appointments realise the difficulty of acquiring land in urban areas for public purposes, and although our legislation is being continually amended, as yet it is admittedly inadequate, and procedure under Act of Parliament to compulsory acquirement is still in favour of the private owner; and it is generally conceded that procedure by private treaty is, when possible, very much cheaper.

Improvements seem to point to greater powers being given to local authorities, and even registered societies, for acquiring land without reference either to Parliament or a Government Department. Local authorities need powers similar to those enjoyed by the Metropolitan borough councils under the Michael Angelo Taylor Act. But the crux of the question lies not so much in powers of acquirement as in the basis of compensation.

Under the Finance Act land is to be valued by reference to recent sales where they occur and separately as to site and building. This is good, but the lack of any instruction for arriving at the proportions of the value to be attributed to each is entirely lacking. The most difficult of the issues arising out of the valuation of properties are certainly those connected with its potentiality and expectancy, and here we are at once confronted with that elusive factor increment duty.

VALUATION.

It always appears to me that notwithstanding the importance of its recognition, our valuers, depending too much on traditional practice and custom, take too narrow a view of its range of influence and origin. We easily realise that to primitive man land would vary in value in the ratio of its location and natural resources, and that outside these inherent assets other interests are humanly created; and it appears to me that the lack of a clear understanding of the difference between land undeveloped and developed, between its inherent and acquired interests, between its natural and artificial assets, is at the root of all bungling in property valuation. As a town planner with broad views as to property valuation I make these suggestions:—

In assessing the value of a property in an urban area, site and building should be valued separately. An overall price might be arrived at by a recent sale, the average nett rental during a period of three years, or the rateable value amended if out of date, and twenty-five years' purchase or more according to conditions of permanency. I would divide this between site and building. I would settle the site value in accordance with the decision of a judicial commission which should sit and settle site values by the test of taking typical parts of streets, or areas of a town periodically, but in periods not exceeding twenty years. The difference between these periodic values would represent increment, and I would credit the particular property in question with a potential value only if it could be shown that the [illegible] exceeded the average of other properties in that part of the street or town. If less use than the average, [illegible]

As to what amount of freedom should be given to local authorities in the compulsory acquisition of property for public purposes, I would for safety's sake like to see a Government Department consulted on all occasions. But my recollection of the procedure of certain local Government Boards [illegible] makes me shudder to think of the application of that principle in its entirety. The safety ensured to the individual by compulsory reference to a higher [illegible] compensated for by the time and expense necessary to make that authority acquainted with the conditions of the case. I would have the Michael Angelo Taylor Act in some sort of form extended to every local authority with power to [illegible]

* Extracts from paper read at the last meeting of the Town Planning Institute.

recent or the amount at stake comparatively small. Further, I would [illegible] as held in his able symposium on the municipal purchase of land, empower municipalities to obtain land in advance without necessarily being obliged to state the specified purpose for which each acre should be used.

I have now, I think, dwelt at sufficient length upon the acquisition of urban land. We will now proceed to discuss more closely its utilisation.

UTILISATION OF URBAN LAND.

I hope that the time is not far distant when the powers contained in the Town Planning Act with reference to the ultimate disposal of undeveloped lands will be extended to built-up areas with regard to their future rebuilding. The extraordinary changes, both in the use and value of properties that have already overtaken and are still overtaking urban areas due to the newer means of communication, are as yet but partially appreciated, and but little understood. We ought certainly to have a Town Planning Act with reference to built-up urban areas. Borough councils should hold powers of control over the reconstruction of properties lying in the route of prospective streets, and ought also to have control over the class and character of new buildings to be erected in any particular part of a town. There would, of course, be compensation to pay where the prevention of development was incurred in view of the construction of a new street; but I think it is right and proper that compensation should not be admitted in respect of the prevention of a class of property that would prove detrimental to the best interests of the locality in which it was proposed to be erected.

I think that the time will very shortly arrive when it will be realised that the wholesale demolition of worn-out areas and huge schemes for rebuilding will be found to be more profitable than the present system of hopeless preservation and patching, and this will be found to be more particularly the case in regard to residential property.

Assuming that large areas of worn-out residential property could be acquired reasonably in urban areas, both in [illegible] and condemned not only by public authorities, but also by societies—the question that would at once confront us would be, What sort of scheme for rebuilding would meet with modern requirements as regards convenience and appearance, and at the same time provide a good financial return? I venture to affirm that, while some areas would be better converted into commercial districts, the majority ought again to be rebuilt as residential. I am not one of those who consider that the urban housing question is one entirely of the transference of the occupants of all old residential areas in closely built-up portions of a city to garden suburbs. In my opinion, there will always be a huge population who, with or without a garden, will prefer to live in the town.

In [illegible] ing, our inquiry at once brings us up against the [illegible] the block building of three stories and more or the cottage. In the past the strongest arguments in support of the tall tenement building have been the high price of land, and the need for housing large numbers of people in limited areas, due, in a measure, to the legal necessity of rehousing the whole of the dispossessed within the limits of the reconstructed area. With regard to the first reason—the high price of land—I think it has often been found necessary to erect tall buildings in order to distribute big ground rents over numerous tenements; but at the same time it is questionable whether the extra capital expended upon thick walls, additional staircases, &c., does not outbalance the extra percentage in rents.

BY-LAWS.

So far I have refrained from referring to the by-laws, but before dealing with actual building, which I now propose doing, I must direct your attention to one [illegible] seriously amending. By-laws having reference to the laying out of new streets where the Town Planning Act is not in operation are outside the pale of reasonable discussion. With their inelastic condition of width and construction, their martial insistence on

regularly spaced cross-streets, and their extraordinary opposition to the construction of the picturesque types of residential street known they are actually unsympathetic to all the interests of residential property in towns. Then, as to heights of rooms and proportions of window-space, that these should have no relation to density of building is an anomaly.

By-laws appear to me to be at their best in objecting to matters of construction, thickness of walls, &c.; perhaps they are most insane when they deal with questions of light and air. When will we get rid of that awful 15-in. wall creeping over our roofs like giant snails?

THE LOCAL GOVERNMENT BOARD MEMORANDUM.

It now remains for me to dwell for a moment upon the several possible types of urban residential buildings, and in this connection let me refer you to the Local Government Board's Memorandum of March 25, 1913, which relates to the provision and arrangement of houses for the working classes. In my opinion, this Memorandum is an exceedingly well-drafted document. It is, however, not beyond criticism. Perhaps it is at fault in not making a marked distinction between urban and rural housing. The conditions are very different. Of the five model types for which plans are given, A, B, C and D can be built either in rows or separately. Type E is necessarily semi-detached. While type D is of the parlour pattern, types A, B and C have only the living-room and scullery. It is obvious that the parlour, described by Mr. Burns as the mausoleum, is not in favour with the Local Government Board. Without its provision, however, there is always a danger that the occupants will live in the scullery and consecrate the kitchen.

Time will not permit of my referring to all the debatable questions that arise out of this Memorandum. I shall briefly refer to two others—the back passage and the number per acre. With regard to the former, my experience at Liverpool, where they have a 9-ft. back passage, and at Kennington, where they don't have any at all, convinces me that the latter is by far the best arrangement. The back passage is the resort of all sorts of undesirable men and animals, and suggests all sorts of nasty things. The main reason in support of it—convenience for dust removal—is illusory. In this class of property there is no objection whatever to the little refuse of the day being collected before 10 a.m. at the front door.

With regard to the number per acre, the Memorandum points out that the annual charges in respect of a loan for land spread over a maximum period of eighty years would in most cases constitute a comparatively small proportion of the total annual cost of providing [illegible] houses on the basis of [illegible] to the acre on land at £1,000 per acre [illegible] per house for land per acre would be [illegible] per house. This, of course, is applicable to rural areas, but where land, as at Liverpool, has to be purchased at a cost often exceeding £4,000 per acre, ten to the acre means giving the £4,000 away. While ten to the acre is impossible, if not undesirable, in urban areas, I think a limit of twenty-five or thirty might reasonably be laid down. Even then a price exceeding £1,000 an acre makes difficult building.

The Memorandum states that it is undesirable to erect big rows of houses without a break, and it is stated that this arrangement is monotonous and depressing in appearance. My reply is that it all depends upon how it is done. Long rows of cottages without a break in towns like St. Albans do not strike me as monotonous. It is the repetition of the standard type which becomes monotonous. However, I have really very little fault to find with the Memorandum of the Local Government Board. I consider it a most progressive document, and would particularly commend to the notice of all authorities about to lay out streets for residential purposes part 5, paragraph (*d*), which relates to the desirability of introducing economy and variety in the construction and arrangement of residential streets and approaches.

MUNICIPAL ENGINEERS AS ARCHITECTS.

Finally, one word as to who is to be responsible for the design [illegible] cottages which local authorities are authorised and encouraged to erect. The Local Government Board and all Acts of Parliament studiously avoid any reference as to how this is to be done. The Memorandum states that it will be well to bear in mind that houses erected by a local authority ought generally to be such as will be a model or standard for houses for the working classes which may be erected by private persons. The assumption appears to be that local authorities have only to say the word and the thing is done. As a matter of fact, but few local authorities can afford to permanently keep in their employ officials specially qualified to do the work, and are tempted to entrust such work to their already overworked surveyor and engineer.

The work of the municipal engineer is closely connected with that of the architect in so far as they are both concerned with the mixing of concrete and the erection of a brick wall, but the partnership separates here. For the rest the engineer's ability to erect cottages is the ability of the untrained practitioner added to the experience of the observant amateur. In these days of town planning there is plenty of work for the engineer and surveyor. Their peculiar training and experience enables them to bring to bear in the initial stages of the town plan a considered judgment which is theirs alone, but the architect, by training and experience, is alone qualified to build cottages and advise on the laying out of the separate acres which are grouped together by the engineer and surveyor in his broader view of the [illegible] plan.

Manchester's Third Pipe from Thirlmere.—Alderman Holt, chairman of the Waterworks Committee of the Manchester Corporation, announced to the city council on Wednesday that the third pipe from Thirlmere to Manchester is now completed and in use. The city is now drawing 30,000,000 gallons of water day by day from the Lake Thirlmere.

London Ground Plan.—At a cost of more than £20,000, the great ground plan of London, begun by the County Council exactly twenty years ago, has been completed. It is divided into two sections. The ownership section shows the names of the owners and agents of the freeholds; the detailed section gives the changes that have occurred in the twenty years. The ownership section was completed four years ago, with the exception of 1½ square miles, in respect of which difficulty was experienced in ascertaining the particulars of ownership. It has taken four years to get these particulars. Estates covering 115 square miles, with 36,000 owners, are shown in the plan. The map was originally estimated to cost £16,650, but this sum had been spent four years ago. In addition to this map, a 6-in. map of London showing building operations from year to year is prepared by the council's valuer at a cost of something like £100 a year.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible*

INQUIRIES HELD.

Bingley T.C. (January 28th. Mr. R. H. Bicknell) £267 toward the expense of improving the corner at Keighley Road on the Bradford-Keighley road near Cullingworth. The improvement was authorised by the Bingley Tramway Order of 1913, and must be carried out before the Bingley tramways can be carried beyond the corner on the Bradford route. The total cost of the improvement is estimated at £800, and most of the remaining expenditure will be borne by the West Riding County Council.

Ilkley U.D.C. (January 28th. Mr. W. O. E. Meade-King.)—£800 supplemental expenditure in connection with the erection of the Winter Gardens adjoining the King's Hall. The original estimate of the cost was £3,000, £1,000 of which was for public conveniences. The Local Government Board sanctioned the borrowing of £3,000, but the purchase of more land and enlargement of the building has now necessitated the further sum of £2,800 being required.

Lytham U.D.C. (January 21st. Mr. R. C. Maxwell.) This was an inquiry into an application for the issue of a Provisional Order under the Public Health Act, 1875, to alter the Lytham Improvements Acts so as to grant powers to the council to construct a marine lake and open-air baths on the foreshore, and to acquire the baths and assembly rooms and site for the purposes of a new public hall. It was stated that the lord of the manor had consented to sell the baths and assembly rooms on advantageous terms for the purposes of a new hall, the price being £750, and the ground rent for the 17·20 sq. yds. 1s. 3½d. per yard. The council had also taken 25 acres of the foreshore, from Charlie's Mast to Woodville-street, and it was intended to construct a hall which would be surrounded by a boating lake, like that at Southport. There would be other attractions a paddling pool, and an open-air theatre for entertainments.

Shillelagh U.D.C. (January 29th. Mr. F. E. Sparrow). £2,486 for the completion of the erection of cottages in the district.—The inspector intimated that he would recommend the Local Government Board to sanction the loan, there being no opposition.

APPLICATIONS FOR LOANS.

Audley U.D.C. £1,500 for the purposes of the gas works and mains and £500 for automatic lighters.

Chester T.C. £765 for works of sewerage and £3,012 for tarking up streets.

Croydon T.C. £53 for an underground w.c. at Norbiton.

Edmonton U.D.C.—£1,514 for road improvement.

Holme Cultram U.D.C. £326 further loan for sea defence works.

Larne U.D.C. £15,000 for a sewerage scheme.

Linthwaite U.D.C. £20,100 for paving the main roads.

Louth R.D.C. £300 for works of drainage.

Lymm U.D.C. £300 for works of sewerage.

Malton R.D.C. £320 for works of water supply.

Sealby U.D.C.—£605 for road improvements.

Southgate U.D.C. £1,800 for the erection of a public convenience.

Staines R.D.C. £1,007 for road widening and re-surfacing.

Stoke-on-Trent T.C.—£3,066 for road improvement, and £1,62[illegible] for laying out a park.

Tadcaster R.D.C. £9,000 for works of water supply.

Wallsend T.C. £3,470 for hospital extension.

Walthamstow U.D.C.—£2,000 for the purchase of land for a housing scheme, and £300 for road widening.

LOANS SANCTIONED.

Barnoldswick U.D.C.—£1,500 for an additional lift for the gasholder.

Beckenham U.D.C.—£3,715 for road improvement and silvering.

Bilston U.D.C.—£13,773 for road strengthening and improvement.

Bowland R.D.C.—£2,180 for sewerage works.

Broadstairs U.D.C. £2,650 for the erection of a town depot.

East Ham T.C.—£7,387 for additional tanks and contact bed at the sewage disposal works.

Enfield U.D.C.—£2,810 for keeper's lodges and public conveniences in the public parks.

Finchley U.D.C. £325 for a public swimming bath and £750 for water filtration plant.

Foleshill R.D.C. £11,250 for the provision of workmen's houses.

Hendon U.D.C. £11,120 for sanitary purposes. Duties paving and kerbing and £9,092 for wood paving.

Holme Cultram U.D.C.—£1,224 for sea defence works.

Lurgan U.D.C.—£1,200, supplemental loan for the erection of cottages.

Luton R.D.C. £1,150 for a sewerage scheme.

Rawmarsh U.D.C. £2,000 for a scheme of sanitary improvement.

Rotherham U.D.C.—£2,000 for sewerage works in the South Ward.

Withernsea U.D.C.—£2,720 for road works, and £400 for sewerage works.

Worcester T.C. £450 for the provision of public conveniences.

Garden City for Government Workers.—Following [illegible] Woolwich Borough Council to the Local Government Board drawing attention to the dearth of housing accommodation at Woolwich, owing to the influx of workmen at the Arsenal, the Government have purchased 90 acres of land between Woolwich and Eltham, and the estate is to be laid out as a garden city for Government workmen. The plans provide for blocks of four and six houses [illegible] to the road by gates 200 ft. deep, leaving ample garden space.' About 1,000 houses are to be built, and a portion of the estate is to be preserved as an open space.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making this feature as complete and accurate as possible.*

The following are among the more important projected works on which particular appeal is lacking: Bath Rural D.C. housing and beach protection; Aberystwyth Corporation sheet, refuse disposal; Bridlington road and materials; Cork Corporation, Glyncorrwg Local Sanitary Authority, Stirling Corporation, sewerage and sewage disposal; Portobello, Rochdale, sewerage and electricity; Arnold U.D.C., Nottingham, Pontefract and other projected works will be found in our Local Government Board Inquiries page.

BUILDINGS.

Bath T.C.—An estimate of £7,150 has been passed for slope protection at the Bathing Establishment.

Bridlington T.C.—The council are considering a proposal to erect [illegible] for the Electricity Department.

Exeter T.C.—The city surveyor, Mr. J. Maddock, has received instructions to prepare plans for [illegible] fronting Bonhay-road and Queen-street.

Glyncorrwg U.D.C.—The surveyor, Mr. W. P. [illegible], has received instructions to obtain tenders for the purchase of land at the rear of the Council Offices, Caerau.

Huddersfield T.C.—The Highways Committee has requested the Parliamentary Committee to apply for powers in the next Parliamentary Bill to provide for the erection of all back-to-back houses within the borough.

Leyton U.D.C.—It is proposed to provide a public convenience at the corner of Church-road and Lea Bridge-road, at a cost, including the purchase of the land, of £2,110.

Lincoln T.C.—Having provided open-air bathing north, south and west of the city, the corporation are now considering the best means of providing for the provision of a bathing station on the banks of the river Witham on the town side of Pyewipe Inclosure. It is announced that they were now in a position to obtain a [illegible] of attaining their object at a cost of about £100. Baths would be provided at low Stamp End Lock, and people living on the south side of the city would be conveyed to the corporation workmen.

Loughborough T.C.—The council on Tuesday approved the expenditure of £300 on land, [illegible] purchase and [illegible] in connection with the housing undertaking.

Luton T.C.—Amended plans have been prepared for the extension of the infectious diseases hospital.

North Riding C.C.—The council have accepted the contributions of the Road Board [illegible] and Guisborough Urban and Rural District Councils (£100) towards the cost of rebuilding Dunsdale bridge and improving the approaches thereto.

Nuneaton T.C.—A tender, at £583, has been accepted for the erection of a mortuary.

Rochdale T.C.—The Tramway Committee recommend the provision of an additional car shed and workshop at an estimated cost of £11,000.

HOUSING AND TOWN PLANNING.

Aberystwyth T.C.—The council have under consideration an extensive scheme for the provision of working-class dwellings.

Cleator Moor U.D.C.—The Housing Committee have adopted a housing scheme estimated to cost £7,000.

Evesham R.D.C.—It was reported that the council's housing scheme had been completed at £15 or £20 below the estimated cost, after £100 had been spent on extras. The surveyor, Mr. E. Holloway, stated that, as far as he could see, there would be a saving on all the schemes.

Market Bosworth R.D.C.—A scheme has been approved for the erection of twenty-five workmen's houses.

Wednesbury T.C.—Plans have been approved for twenty-four artisans' dwellings. Each house will have 287 sq. yd. of ground, either paved or as garden, while on the opposite side of a new intended road is a large mound with an area of 19,481 sq. yds. The slope of this has been planted with trees, so that the aspect will be an exceptionally pleasant one.

PARKS AND OPEN SPACES.

Hereford T.C.—[illegible] the Ecclesiastical Commissioners and the Bishop of Hereford [illegible] the purchase of a large [illegible] proposed to be laid out as an open space.

REFUSE COLLECTION AND DISPOSAL.

Bridlington T.C.—A [illegible] has been passed to [illegible] the Council's best [illegible] is at present charged 10s. 2½d. per load.

Dover T.C.—A committee has been formed to consider the desirability of the council undertaking the work of refuse disposal.

ROADS AND MATERIALS.

Armagh R.D.C.—The county council have forwarded [illegible] approving the new scheme for the maintenance of the [illegible] No. 2 rural district by a system of direct labour, under the charge of the county surveyor. It is provided, however, that the foremen and surface men under the scheme shall be appointed by the [illegible] Council.

Barking U.D.C.—[illegible] Mr. D. L. Jackson, Parliamentary [illegible] has been appointed to the borough of Coppetts.

Brierley Hill U.D.C.—The council have agreed to the proposal of the surveyor, Mr. J. L. Harpur, that application should be made to the Road Board for [illegible] the improvement of a number of roads.

Chelmsford T.C.—The borough surveyor, Mr. P. T. Harrison, has received instructions to prepare plans for making up Swiss-avenue.

Cork T.C.—A letter has been received from the Road Board stating that they were prepared to give favourable consideration to an application by the council for the grant of £1,000, previously indicated to be allocated to works of road improvement, estimated to cost £5,000.

Derbyshire C.C.—The council have approved the scheme of the county surveyor, Mr. J. W. Horton, for the diversion of the main road at Allestree, at an estimated cost of £[illegible].

Durham C.C.—The council have agreed to the proposals of the Works Committee to pave the carriageway of Elvet Bridge, Durham, at an estimated cost of £578, and the completion of the Darlington-Durham section of the Great North road, at an estimated cost of £12,000, application [illegible] Road Board for a grant of half the cost of the first-mentioned improvement, and a grant [illegible] towards the cost of the North road work. With reference to the proposed improvement of the Hart roads, it was reported that the estimate had been revised to £13,058, towards which the Road Board had conditionally agreed to contribute £9,200, and the Hartlepool Rural District Council £2,800, on the understanding that the county council would take over the roads as main roads. The Road Board have agreed to contribute half the estimated cost (£5,100) of the improvement of Crossgate-path, Durham, provided the Durham Corporation [illegible] £1,000, in lieu of [illegible] the land necessary for the work.

East Grinstead U.D.C.—The council have conditionally approved the plan of the surveyor, Mr. W. E. Woolton, for a proposed widening in the Lewes-road, at an estimated cost of £350, subject to the county council contributing a reasonable proportion of the expense.

Glyncorrwg U.D.C.—It has been resolved to carry out works of street improvement at an estimated cost of £10,000.

Holywell R.D.C.—The council have rescinded a resolution passed last July to contribute not more than £50 a year towards the cost of the proposed new road from Gronant to Rhyl.

Kildare C.C.—Approval has been given to a scheme for the construction of a new road in Ballyna and [illegible] the Edenderry No. 2 rural district.

HIGHWORTH. February 22nd.—For the repair of roads and hauling materials, for the rural district council.—Mr. O. Kimber, surveyor, Kite Hill, Wanborough, Wilts.

EPSOM.—February 22nd.—For the supply of road materials, for the rural district council.—Mr. T. E. Ware, surveyor.

SOUTHALL-NORWOOD.—February 23rd.—For the supply of 3,000 tons of tarred slag macadam, and repairing road surface, for the urban district council.—Mr. Reginald Brown, engineer and surveyor.

SURREY.—February 23rd.—For the supply of steam rollers and water carts, for the county council.—Mr. A. Dryland, county surveyor, County Hall, Kingston-upon-Thames.

MUTFORD.—February 24th.—For making up two roads, for the rural district council. The Surveyor.

RICHMOND.—February 24th.—For making up certain roads, for the corporation.—Mr. J. H. Brierley, borough surveyor.

SHEPTON MALLET. February 25th. For road maintenance and the supply of materials, for the rural district council.—Mr. J. Neish, surveyor.

BRIDGNORTH.—February 25th.—For the supply of granite, basalt, and slag, for the rural district council.—The Surveyor, Oldbury, Bridgnorth.

Sanitary.

COTTINGHAM.—February 8th.—For reconstructing brick outfall sewer and manholes, for the urban district council.—Mr. J. H. Hanson, surveyor.

ALNWICK.—February 8th.—For supplying and laying earthenware pipes, for the rural district council.—Mr. F. Wade, Embleton.

LEEDS.—February 8th.—For the supply of cement, earthenware drain pipes, sewer ironwork, galvanised dirt boxes, and sewer ventilating columns, for the corporation.—Mr. W. T. Lancashire, city engineer, Municipal Buildings.

BLAYDON. February 9th.—For scavenging work, for the urban district council.—Mr. R. Biggins, Council Offices.

ORSETT.—February 10th.—For the construction of a sewer, manholes, and disposal works, for the rural district council.—Mr. J. Beck, clerk, 2 Orsett-road, Grays.

HOUGHTON-LE-SPRING.—February 10th.—For work of scavenging, for the rural district council.—Mr. W. Morley, sanitary inspector, Sunderland-street.

PENYBONT.—February 12th.—For scavenging work in certain parishes, for the rural district council.—Mr. E. W. Davies, sanitary inspector, Bryn-road, Tondu.

WIRRAL.—February 12th.—For the construction of stoneware pipe sewers and other works, for the rural district council.—Mr. W. W. Shennan, 9 Hamilton-square, Birkenhead.

RADCLIFFE—BURY.—February 13th.—For the extension of the sewerage systems, for the Radcliffe Urban District Council and the Bury Rural District Council.—Mr. W. L. Rothwell, engineer, Radcliffe.

HAMBLEDON.—February 13th.—For the removal of refuse, for the rural district council.—Mr. F. Smallpeice, clerk, 138 High-street, Guildford.

MANCHESTER.—February 13th—27th.—For sewage disposal works extension, for the Rivers Department.—The Secretary, Rivers Department, Town Hall.

BLEAN.—February 15th.—For the construction of stoneware pipe sewers, manholes, and other works, for the rural district council.—Mr. F. A. Ward, engineer, Rosencath, Eddington.

KEYNSHAM.—February 15th.—For the construction of sewers and manholes, for the rural district council.—Mr. H. M. Bennett, surveyor, 36 Corn-street, Bristol.

LANCHESTER.—February 15th.—For scavenging No. 2 district, for the rural district council.—Mr. J. R. Lupton, surveyor.

THIRSK.—February 15th.—For the removal of house refuse, for the rural district council.—Mr. A. Green, Holmefield-terrace, Sowerby.

CROYDON.—February 15th.—For the supply of 4,000 tons of clinker filling for the new percolating filters at South Norwood farm, for the corporation.—Borough Engineer.

EAST GRINSTEAD.—February 17th.—For the construction of storm-water drains, for the rural district council.—Mr. C. Turton, surveyor.

LANCASTER.—February 18th.—For emptying cesspools, for the rural district council.—Mr. Littlefair, sanitary inspector, 5 Dalton-square, Lancaster.

CHERITON.—February 22nd.—For the removal of house refuse, for the urban district council.—Mr. A. Atkinson, acting clerk.

WOKING.—February 22nd.—For the construction of three screening chambers and detritus tanks, three sedimentation tanks, fifteen circular bacteria beds, provided with automatic distributors, six humus tanks, various lengths of effluent carriers, engine-house, sludge pump and press-house, and engine-houses for driving screens and pumping humus, and other works, for the urban district council.—Mr. G. Midgley Taylor, Caxton House, Westminster, S.W.

Stores.

CLEETHORPES.—February 8th.—For the supply of chalk, granite, concrete flags, bottoming macadam, topping macadam, straight York kerb, straight York channel, granite radius kerb, granite radius channel, ordinary pipes, new gullies, standard pipes, and ordinary pipes, for the urban district council.—Mr. C. H. Waithman, Council House, Cleethorpes.

WOOLWICH.—February 13th.—For the supply of ballast, sand, broom [illegible], drain pipes, forage, granite kerb, harness, ironmongery, road material, sewer ironwork, and timber, for the borough council.—Mr. J. Rush Dixon, borough [illegible], Town Hall, Woolwich.

RICHMOND.—[illegible] supply of uniform clothing, ironfounders' work, tools, ironmongery, bass brooms, brushes, granite, granite siftings, broken chalk, brown pit flints, crushed shells, granite kerb, channel, setts, York kerb, flagging, Portland cement, grey lime, artificial stone paving, harness, stable requisites, tar, tarred macadam, wood blocks, oils and paints, for the corporation.—Mr. J. H. Brierley, borough surveyor.

HALIFAX.—February 13th.—For the supply of paving setts, flags, kerb, granite, limestone chippings, lime, Portland cement, gravel, sand, earthenware pipes, granite paving setts, artificial flags, horse provender, coal, castings (manhole covers, gullies, and name plates), wrought iron, shovels, picks, ironmongery, oils, paints, candles, gunpowder, cotton waste, gaskin, brooms, brushes, timber, precipitants for sewage, filter cloths for sludge pressing, and team labour, for the corporation.—Mr. James Lord, borough engineer.

ECCLES.—February 15th.—For the supply of setts, flags, kerbs, broken rubble, broken slag, granite macadam and chippings, prepared tar slag, prepared tar limestone, limestone cube chippings, gravel, cinders, castings, pitch, creosote, tar, Simpson's patent street gullies, stoneware passage gullies, stoneware pipes, bends and junctions, mortar, and channel stones, for the corporation.—Mr. Thomas S. Picton, borough surveyor, Eccles.

SURBITON.—February 15th.—For the supply of team labour, broken Guernsey granite, concrete paving flags, general stores, repairing burst and damaged water pipes, cast-iron goods, tools, smiths' work, Derbyshire limestone, tar-paving materials, house refuse removal, Norway granite kerbing, Norway granite paving setts, Kent flints, gravel, Thames ballast, scavenging, slag tarred macadam, scavengers' brooms, horse sweeping brooms, machine brooms, lubricating oils, and sludge press cloth, for the urban district council.—The Surveyor, Council Offices, Ewell-road, Surbiton.

RAWTENSTALL.—[illegible] of road metal, earthenware pipes, gullies, timber, pitch, creosote oil, disinfectants, Portland cement, iron castings, local stone, workmen's tools, scavenging brushes, horse-shoeing, coal and coke, for the corporation.—Borough Surveyor.

STOKE-ON-TRENT.—February 20th.—For the supply of Portland cement, blue paving bricks, common bricks, sanitary pipes, gullies, macadam, chippings, pitch, creosote oil, cast ironwork, picks, shovels, general ironware, paints, oils, brooms, brushes, bath towels, dusters, ironmongery, general stores and disinfectants, for the corporation.—Borough Surveyor.

MANSFIELD.—February 22nd.—[illegible] granite, slag, tar-macadam, natural flags, kerbing, channelling, concrete flags, Portland cement, stoneware pipes, junctions, bends, timber, sewer ironwork, castings, coal, ironmongery, general stores, paints, oils, varnish, brooms, brushes, disinfectants, and harness, for the corporation.—Mr. Thos. P. Collinge, borough engineer and surveyor.

SOUTHALL-NORWOOD.—February 23rd.—For the supply of granite, lime, cement, oil, alumino-ferric, waste, press cloth, disinfectants, tools, picks, shafts, dust-bins, Kentish pit flint, hoggin, gravel, horse hire, steam rolling and scarifying, forage, coal, and coke, for the urban district council.—Mr. Reginald Brown, engineer and surveyor, Town Hall, Southall.

SOUTHEND-ON-SEA.—February 24th.—For the supply of stoneware pipes, bends, flints, bricks, gravel, sand, timber, ironmongery, paints, oils, colours, cement, lime, chalk, team labour, forage, tar-paving, tar-macadam, iron castings, granite kerb, channel, broken Guernsey granite, broken granite, pitch, creosote oil, harness supplies, sundries, brooms, brushes, steel, iron, and disinfectants, for the corporation.—Mr. Ernest J. Elford, borough engineer.

SOUTH SHIELDS.—February 27th.—For the supply of Northumberland whinstone, Fifeshire whinstone, Aberdeen and Norwegian granite, slag, granite chippings, Caithness flags, Portland cement, cement-concrete flags, cast ironwork, shovels, scavengers' brooms, machine brooms, coal, coke, disinfectants, leather hose, sewer boots, jackets, sanitary pipes, paints, paint oils, glass, timber, iron, horseshoe nails, cart axles, springs, tar, pitch, oils, and general stores, for the corporation.—Mr. Leslie Roseveare, borough engineer and surveyor.

MARYLEBONE.—March 1st.—For the supply of road materials, horses, harness and drivers, Portland cement, oils, stoneware sewers, ironwork for sewers, and slopping, for the borough council.—Mr. J. Paget Waddington, borough surveyor.

EPSOM.—March 9th.—For the supply of sewerage ironwork, gully gratings, shovels, picks, brooms, forks, dust skeps, disinfectants, Portland cement, stoneware pipes and gullies, kerbing and channelling, setts, broken granite, chippings and limestone dust, tar-paving and tar-macadam, coal and coke, hay, corn, bran, straw, bricks, paraffin, artificial stone paving, Thames ballast, Thames sand, veterinary surgeon's services, tar, pitch, and team labour, for the urban district council.—Mr. Edward R. Capon, surveyor, Bromley Hurst, Church-street, Epsom.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

COUNTY COUNCIL OF NOTTS.
APPOINTMENT OF COUNTY SURVEYOR

The County Council of Notts are desirous of receiving applications for the office of County Surveyor. The person appointed will be required to reside in or near to the Town of Nottingham, and to devote the whole of his time to the discharge of the duties of the office. He will not be allowed to engage in any private practice.

The salary will be £750 per annum, and in addition, travelling expenses will be paid.

Applications, marked "County Surveyor," with copies of not more than three recent testimonials, must be made upon Form, which will be forwarded by me upon receipt of an addressed foolscap envelope.

The application must reach me not later than midday on Saturday, the 27th day of February, 1915.

Canvassing is strictly prohibited, and will be deemed a disqualification.

(By order)

H. HAMPTON COPNALL,
Clerk of the County Council.

Shire Hall,
Nottingham.
February, 1915. (2,306)

BOROUGH OF HERTFORD.
APPOINTMENT OF ROAD FOREMAN

The Corporation of Hertford invite applications from persons with Macadam experience, from 30 to 40 years of age, for the appointment of Road Foreman.

Applicants must be thoroughly practical in the construction and maintenance, paving, steam rolling, tarring, [illegible] and capable of taking charge of and superintending a staff of men, horses, plant, &c.

The person appointed will have charge of the indoor staff and horses of the Corporation, and will work under the direction and instructions of the Borough Surveyor. He will be required to work the [illegible] and [illegible] Wages 32s. per week. Use of house at the Corporation Depot, rates, taxes, and water free.

Further particulars and [illegible]

[illegible] stating age, experience, and [illegible] to the Borough Surveyor, The Castle, Hertford.

Applications, in candidate's own handwriting, must be accompanied by three recent testimonials (originals to be produced if required), to be sent addressed to the undersigned, and endorsed "Road Foreman," not later than the 16th February, 1915.

Canvassing will be a disqualification.

ALFRED BAKER,
Town Clerk.

The Castle, Hertford.
January 28, 1915. (2,319)

Vol. XLVII. FEBRUARY 12, 1915. No. 1,204.

Minutes of Proceedings.

By-laws and an Appeal Court.

At the Royal Sanitary Institute Congress in 1913 a resolution was passed asking the council to urge upon the Local Government Board the desirability of establishing a tribunal to which appeals might be brought from decisions of local authorities on points relating to practice in the working of building by-laws. Up to the present the passing of this resolution has produced the desired result, and the matter was again ventilated at a meeting of the Institution of Municipal and County Engineers held on Friday last. The subject was introduced in a paper by Mr. H. D. Searles-Wood, F.R.I.B.A., on "Building By-laws and a Court of Appeal," which, together with a report of the discussion that followed, will be found in another column. The suggestion as outlined in the paper was that, in the event of a difference of opinion arising between the authority and the building owner as to the suitability of his design and the construction of the by-laws, the building owner should forward his drawings to the Local Government Board, with a statement of the comments put forward by the local authority should pass them, and the local authority should state their reason for objecting; and that the decision of the Local Government Board should be binding on all parties. The discussion, however, appears to have proceeded on rather different lines, and to have developed into a consideration of the question whether a tribunal should be constituted with power to modify or dispense with by-laws in particular cases. One of the speakers, Mr. Turner, after analysing the various classes of questions which can arise in the administration of by-laws, expressed the opinion that only if there were no by-laws, or if the by-laws could be dispensed with if it were thought desirable to do so in any individual case, would there be any work for the proposed court of appeal to do. In regard to the desirability of a dispensing power, there was practical unanimity. As Mr. Collins said, most surveyors desire to be reasonable, but so long as by-laws have to be administered rigidly, sometimes they are compelled to enforce requirements which they themselves regard as unreasonable in the circumstances of the case under their consideration.

The real difficulty lies in determining in what person or authority the power of dispensation should be reposed. To this question there are four possible answers. In the first place, it might be placed in the hands of the surveyor to the local authority. The objections to this course are so obvious as hardly to require statement. We need only mention here the great responsibility involved and the probability of conflict between the surveyor on the one hand and the builder, the architect, or the member of the local authority on the other hand. Next, the local authority themselves might be endowed with some discretionary power of dispensation. This appears to be hardly less objectionable. If the local authority acted on the advice of their surveyor, that official would be in almost the same position as if the ultimate decision rested with him alone. If they acted without consulting their surveyor, the power of dispensation would be exercised by a non-technical and possibly interested body. Then, it was suggested that the appeal might lie from the local authority to the county council. If we are to accept the word of Mr. Wakelam—and surely he is entitled to speak with authority—the county councils simply do [illegible] Mr. Collins, too, put it very strongly when he said that the county councils throughout the country would be the worst possible court of appeal.

Apart from the Metropolis, where all the circumstances are peculiar, the county councils have nothing to do with buildings, and we agree that, if any tribunal is set up, it should consist of a small number of persons, chosen on account of their expert knowledge of the matters they would have to consider, and having jurisdiction over as wide an area as practicable. The view of the meeting clearly was that, so far as local authorities and their surveyors are concerned, they must have an absolutely rigid code of by-laws to which they must adhere in all cases. We are inclined to agree with one speaker who said that the very difficult question of dispensation might be solved by the creation of an independent [illegible] which, in exceptional cases, some kind of appeal might be made.

*

Mr. Cole's Retirement.

The meeting of the Institution of Municipal and County Engineers which was held at headquarters last Friday evening was made the occasion of the presentation to Mr. Thomas Cole, formerly secretary, and now consulting secretary to the institution, of a handsome testimonial, to which upwards of 800 members had subscribed. The speech made by the president in handing the gifts to Mr. Cole was in every way worthy of the occasion. Referring to the identification of the late secretary with every stage of the growth and progress of the institution for the past thirty-three years, Mr. Pickering reminded the members that during that time the membership had increased no less than eightfold. There was general agreement, too, with the statement that during his long career Mr. Cole had had the entire confidence of each succeeding council, and the esteem of every single member of the institution with whom he had come into contact. The gifts, which took the form of a gold watch and chain and a cheque, together with a gold bracelet watch for Miss Cole, were handed to the recipient at the conclusion of the president's speech, and Mr.

Cole was very warmly received on rising to acknowledge them. In the course of his remarks he gave some account of the history and work of the institution during his long term of office. The development of the institution has resulted both from an extension of geographical boundaries and a broadening of the basis of membership. Originally the Association of Municipal and Sanitary Engineers and Surveyors under which name the institution commenced its existence—was only open to chief surveyors to local authorities in England and Wales. Now, however, the activities of the institution are commensurate with the boundaries of the British Empire, while classes of membership have been formed so as to enable deputy and chief assistant surveyors, as well as the younger members of the profession, to be included in its ranks. That part of the speech which dealt with the question of security of tenure was of peculiar interest. Mr. Cole recalled that interviews had been secured with no fewer than three Presidents of the Local Government Board, the last being with Mr. John Burns in 1914, to whom was handed a great mass of evidence of cases of hardship which had been collected by the institution. Mr. Cole paid a generous and well-merited tribute to the assistance he had always received from Mr. Giles, the assistant secretary, and other members of his staff, and congratulated the council on having secured the services of a thoroughly competent man in the person of Mr. Robinson as the new secretary. Finally, Mr. Cole spoke briefly of the future of the institution, to which he looked forward with every confidence. The whole speech was very eloquently delivered, and was listened to with the greatest attention, and were it not for the necessarily widely scattered nature of the membership of the institution, we are confident that a much larger room would have been required to contain those who would have been present. As it was, the proceedings were marked with great cordiality, and the general feeling was that the institution was to be congratulated on retaining the services of Mr. Cole as consultant and honorary secretary and member of the council.

* * *

Slag Concrete. The American Society for Testing Materials recently had under consideration a most interesting paper in which was discussed the suitability of slag as an aggregate in concrete. The question is one of considerable commercial importance both in the United States and this country, for if it can once be established that furnace slag may be freely used for this purpose a great outlet will have been found for a waste product, the handling and disposal of which entail considerable expense. Mr. W. A. Aiken, who read the paper in question, was able to report the result of extended experiments which he had carried out for the purpose of comparing the strengths of coarse aggregates consisting of limestone, Trap-blue trap rock, and slag respectively. The original tests were made on specimens which had been allowed to set for twenty-eight days, and it was in consequence of the very favourable way in which slag compared with the other materials used that more extended experiments were made later on. For this purpose no fewer than 500 6-in. cubes were manufactured, the intention being to test some of them at periods of one, three, six, nine, and twelve months respectively. As regards the test conditions, Mr. Aiken stated that the materials used were all commercially procured in Philadelphia, and that the work of making the specimens was no better than that under ordinary field conditions of concrete construction—no attempt having been made to enter into any elaboration. The main object of the investigation was to determine whether the compressive strength values developed were sufficiently great to warrant the employment of slag as an aggregate, in competition with broken stone or gravel, and this question Mr. Aiken answers in the affirmative. He concludes that from the actual strength of the concrete developed in these tests—its weight per cubic foot (which is less than that of most materials used similarly); the recognised solubility of slag, which permits it to act as a puzzolanic material; its alkaline nature, which is especially conducive to rust-prevention in the case of reinforced concrete construction; and from the relatively high combined percentages of silica, alumina, and iron, which make for permaneney of the resulting concrete—slag of similar constitution to that experimented upon is in every way satisfactory for use as aggregate in concrete.

* * *

The Cleaning of Water Mains. It is interesting to note the slow and gradual development of methods for cleaning water mains. The development has been slow, but the adoption has been slower. However, the number of water authorities who are making use of the method is increasing, and the method itself is being perfected. The chief reason why the scraping of mains has not been more generally adopted is that it has been considered too expensive for application. When this is the case the chief reason is to be found in the fact that mains have not been laid with hatch-boxes or facilities for cleaning, and the cost and trouble of inserting the scraper therefore becomes a serious matter. Where, however, the mains have once been scraped and provision made for subsequent cleaning, the cost of the periodical scraping is not great. Where the alternative is to lay a new system of pipes it is sufficiently evident that the outlay on cleaning must, under most conditions, be well worth while, and that it is ignorance of the merits of the process rather than its cost or difficulty which is the chief reason why it is not more readily adopted—for the cost of cleaning must be great indeed if it is comparable to that of laying a new main.

Without quoting figures available from the many cases of which records have been kept, it is certain that the cost of severing a main in a few places and of employing a few workmen with the necessary appliances for a few days cannot possibly equal the cost of a new pipe line. On the contrary, the cost of cleaning can be only a fraction of the cost of the pipe. Machines used for the purpose are of several kinds. First there is the scraper which is pulled through the pipe, generally used for small mains; then there is the machine which is driven forward through the main by the pressure of the water; and recently the turbine machine has been used. In the last-mentioned case the water pressure forces the machine through the pipe, and causes cutters in front of the machine to revolve. The efficiency of such a machine depends to a great extent upon the water pressure. The possibilities of useful working, especially at the top end of a main near the reservoir, might possibly be increased by the use of a pump. The improvement in principle is clear, and is an interesting step in the development of methods of main cleaning.

* * *

Fire Precautions and the War Emergency. The British Fire Prevention Committee's special organisation to meet the war emergency completed its first half year's work this week. The work comprised mainly an extensive issue of fire warnings; the formation of a technical enquiry office to deal with all manner of technical enquiries; the formation of a special fire survey force of eighty honorary fire surveyors entrusted with special duties; and the formation of a special fire service force of 300

fire brigade officers and men available for mobilisation at short notice. No fewer than 105,000 "fire warnings" in the form of small posters have been issued by the committee and distributed either directly or through the Government departments and other public authorities concerned. Such "warnings" were specially prepared for military hospitals and refugee hostels, translations in French and Flemish also having been made available for Belgian wounded and Belgian refugees. There were "fire warnings" for farmers as to grain storage, for troops billeted and for factories engaged on Government supplies. In many cases trade associations were afforded facilities for reproducing the warnings for use among their own members and subscribers, while some 400 daily newspapers and technical journals have reproduced the warnings in part or whole. The technical enquiry office has dealt with many hundreds of cases, some of considerable complication. The fire survey force has dealt with some 200 surveys, and these surveys have occasionally required the inspection of as many as fifty individual buildings. Several patrols have already been requisitioned from the fire service force. The whole of the services provided by the committee, as far as the professional men assisting are concerned, have been rendered gratuitously, the paid staff being limited to a small clerical staff at the headquarters in London. Over 200,000 postal items have had to be dealt with, and the districts covered include not only Great Britain and Ireland, but the various stations in the Mediterranean and Egyptian Protectorate.

The High-speed Gas Engine.

The advantages which the high-speed gas engine possesses for direct coupling to centrifugal pumps, particularly in connection with works of sewerage or drainage, renders a consideration of its merits of special interest to municipal engineers. The subject was very ably dealt with in a paper read by Mr. F. Embleton, of Manchester, at the last meeting of the Junior Institution of Engineers. Mr. Embleton pointed out that the ease and rapidity with which these engines can be started up is of great advantage, particularly in installations for the prevention of floods, or in sewage works, where, in the event of a sudden downpour of rain, they can be started up immediately to deal with the flood water and relieve the main sewers. Several large installations have been put down for this purpose by the London County Council, consisting of vertical gas engines coupled to centrifugal pumps, and using town's gas, which is always ready on tap; and as their use is only occasional, and for relatively short periods, the cost of gas does not much matter. Generally speaking, the high-speed gas engine may be said to be reliable, regular in speed, and economical in running. Neither boiler nor chimney-stack are required, while the absence of vibration is an additional advantage. The initial cost of this type of engine is rather higher per rated horse-power than that of the slow-speed type, although some allowance should be made on account of its compactness and the consequent saving in space and housing. The running cost, however, is comparatively low, although the actual saving will vary with the size of plant, type of engine and boilers, and last, but not least, the price of coal. We commend to the attention of our readers the full extracts from Mr. Embleton's paper, which will be found in another column in this issue.

Cast Iron or Steel Pipes.

The controversy which has raged as to the relative merits of cast iron or steel pipes has been chiefly between manufacturers. It would probably have received little attention but for the fact that the Local Government Board clearly regards the life of the steel pipe as being considerably less than that of the cast-iron pipe. Notwithstanding this, the use of the steel pipe in this country has increased enormously, and the road last year was exceptionally good, even under the present particularly difficult conditions. The lake in St. James's Park has a concrete bottom, on which a long line of coated steel water pipes were laid some years ago. This lake has been empty of water for some time past, and the pipes are exposed for their whole length, and it is possible for the observer to see the extent to which the coating has preserved the outside of the pipes—which are generally covered by the water.

Experience certainly points to the fact that the corrosion of pipes, whether of iron or of steel, depends upon the quality of the water. There are very many instances of the serious corrosion and failure of cast-iron pipes and of the corrosion and failure of steel pipes. The use of either pipes must depend upon a number of conditions which the engineer must take into account, and before he can come to a right decision he may need the assistance of the chemist and possibly even that of the bacteriologist. The saving in cost is evident with the steel pipe, and its life is dependent entirely upon the quality of the water passing through it and in a lesser degree upon its coating. It is also dependent to some extent upon the character of the ground in which it is laid, but the outer coating, being thicker and open to inspection, may be made in such a manner as to afford efficient protection. Whether the use of cast-iron pipes is sometimes justified by habit rather than by expediency should be considered. A considerable saving of expense is not to be ignored. If the cast-iron pipes were made twice as heavy they might last longer, but the expense would not be justified. It may be asked whether the cost of the heavy cast-iron main in place of the steel pipe is justified either.

Snow Removal.

A discussion as to the methods to be adopted in dealing with a fall of snow cannot yet be considered as unreasonable, and so we venture to direct the attention of our readers to the conclusions of a special committee which was appointed to submit a report on the subject at a recent conference of street-cleaning officials at Philadelphia. These conclusions are seven in number, and may be stated quite shortly. First of all, the plan of organisation and the system to be employed should be worked out in advance of the snowy season. Next, the work of removal should commence as soon as the snow has covered the pavements, and, the indications pointing to the storm continuing, the operations should be carried on continuously. Further, it is recommended that the carrying capacity of the sewer system should be utilised as far as possible to get the snow away from the streets. This at once reduces both the handling and haulage of the material. As regards the class of labour to be employed, the committee state that, when practicable, where there is only a small area to be cleaned, the work should be performed directly by the local authority by day labour. This method is not only flexible and capable of easy administration, and it avoids the necessity for the checking and measurement which are required in the event of the employment of contractors. The committee also call attention to the desirability of co-operation with haulage contractors and the police force, and of securing, as far as possible, the assistance of householders. These general principles, having been determined by a committee of experts, are worthy of the careful consideration of those responsible for the work of snow removal in this country.

Foundations—the Main Factor in all Road Work.*

By J. A. JOHNSTON, Division Engineer, Massachusetts Highway Commission.

What to use for foundation, where, how and when to use materials, and in what quantity, is the science of road building. Many men have attained enviable reputations as road builders, based mainly on the fact that their work was all done in a locality which was blessed by Nature with favourable soil conditions.

In our earlier work in Massachusetts it was our practice to use foundations only in such locations as were unquestionably bad, and to take a chance on places regarding which we were in doubt. We believed it was cheaper later to strengthen the weak places than to use extra material that might not be necessary. Under conditions then existing, with comparatively light horse-drawn traffic, and with mainly gravel and water-bound macadam surfaces, this "take-a-chance" policy seemed a reasonable one, but no one could predict the future developments, and I doubt if we have actually saved any money by such attempts at economy.

Many road materials have been unjustly condemned when the real fault lay in the foundation, and not in the surface material. There are many companies advertising their road materials as the final solution of the road problem, when, as a matter of fact, their specialities are merely surfacing propositions, many of which would give excellent results if used over a proper base, but are far from being the whole road, as one might infer from their claims.

WATERPROOF SURFACES.

The statement has many times been made that a waterproof surface requires little or no foundation, because no water can get through it to the soil beneath, and so the base is kept dry. Many cases might be cited to show the fallacy of this belief. A little consideration of the capillary action of the soil which draws water from the sides of the road and underground sources (as well as the water that will seep through the soil from higher points) will show that a waterproof surface is not built well without a proper base. It must be understood that each road is a problem in itself, and no standard treatment can be devised that will fit all conditions. There are many factors entering into the problem—soil, drainage, traffic, available material—all should be considered.

In some localities good gravel can be had at a low cost, but there are many places where good gravel would have to be hauled many miles, and the cost would be prohibitive. In other places stone is abundant and cheap, while in others there seems to be no material fit for foundation purposes.

It is true that if you can obtain the right kind of gravel it makes an excellent foundation, but to give the best results it should be absolutely free from clay, loam or silt, and rather sandy. For instance, on such a base we have built macadam roads with only 3 in. of broken stone. There were a few soft spots in the spring where pockets of loamy gravel were found, but these were taken out when the road developed, and one such road, which carried a considerable traffic on the edge of a thickly settled town, was kept in excellent condition at a low cost for maintenance for twelve years before it was resurfaced. In another place we built a section of road over a very soft bottom (practically quicksand) by first placing a bed of gravel 18 in. deep, and over that 6 in. of macadam. This road has been built sixteen years and has given no trouble. On the other hand, we have many miles of road built on gravel bases 6, 12 and 15 in. in some cases 18 in. deep, that soften up and are badly broken up in the spring when the frost is coming out. It is our practice carefully to locate all soft spots in the spring, so that when funds are available for improving such roads we may intelligently do so without guesswork.

Most gravel contains enough silt, loam, or clay so to draw moisture by capillary attraction that the frost will work in it, and, of course, when the frost crystals thaw, it leaves the particles spongy and wet. This condition is aggravated by the rolling which packs only the surface and the pounding action of horses' hoofs, which all tend to puddle it, just as a [illegible] puddles the soil.

* Paper presented at the annual meeting of the American Road Builders' Association held in Chicago recently.

time from below. Such a result, unless extreme, may not be serious if your road surface is of gravel or even water-bound macadam, for such surfaces are easily and cheaply repaired, but if the road surface is a high-cost bituminous mixture it may be ruined, and you cannot afford to take such chances. It should, however, be borne in mind that a road may stand two or three years over a poor bottom with little apparent trouble, but almost entirely go to pieces the third or fourth year. This fact has caused a great deal of trouble, for the inexperienced man, finding that a road stands all right the first year, and assuming that it will continue to do so, proceeds with the same type of construction under similar conditions until the first fails and the whole road is ruined.

Gravel alone cannot always be trusted for foundation, and should never be used under a high-cost surface except as a substitute under some foundation or concrete.

SUBSOIL DRAINAGE.

In our earlier work we depended largely on side drains built 3·5 ft. deep at the edges of the macadam. A 5-in. pipe was placed in the lower part of the trench, and the drain filled with small stone fragments. Our theory was that these drains would dry out the sub-grade and keep the road surface firm. We built miles of these drains, but they did not accomplish the desired results unless they were supplemented by a stone base under the macadam, and subsequent experience has shown that, except in rare cases, if the road is built over a proper stone foundation, the side drain is unnecessary.

One of John Macadam's theories was that no stone larger than you could hold in your mouth should be used in a road. Now I have a large mouth, but it won't hold as large a stone as experience has proven to give satisfactory results for foundations in Massachusetts.

In the last twenty years we have tried many methods of subsoil drainage and many different forms of foundation. On some of our macadam roads with crushed stone 6 in. thick the road has, after one or two years, softened up badly in the spring. We tried the experiment of adding more crushed stone, without breaking up the old surface. In some cases we added 12 in. of new stone, making a total of 18 in. of stone fragments not exceeding 2½ in. in their largest diameter, and also built ground water drains each side of the macadam, and cross drains at 50-ft. intervals. The result was a failure; after two or three years the road broke up as badly as ever. As these results were obtained in several places, I think we have proven that crushed stone of small size is not satisfactory for foundation, and is suitable only for surfacing. My theory is that the units are so small they have little bearing, and, having no cohesion, when wet they sink readily into the mud. Regardless of theory, the fact remains; and some of these stone particles have been found 1 ft. or more below the original sub-grade. It should also be borne in mind that the cost of the crushed stone is nearly three times that of the larger fragments.

When we first began building our roads, if we found a place which seemed to need a stone foundation we used a telford paving 8 in. deep over 6 in. of gravel. The telford stones were set up on edge, the tops broken off to a true cross-section, and the joints wedged up and chinked. French drains, 3·5 ft. deep, were built at each edge of the road. A year or two later the specification was changed, and the telford was only 6 in. thick over 2 in. of gravel, with the continued use of the side drain. Later we [illegible] the standard roll to [illegible] adopted the V drain, so called because it was roughly the shape of a broad V, about 18 in. deep in the centre and 4 in. at the sides, with stones not over 8 in. in their largest diameter. This V drain is a combination of foundation and drain. The water flows in a channel in the centre of the road, and is led off by bleeders to proper outlets. We built many miles of these drains on foundations only 10 ft. wide under macadam 15 ft. wide. This gave satisfaction in the earlier days, as the traffic did not spread over more than 10 ft. except when passing another vehicle.

While this practice was satisfactory under the old

conditions, it has now been decided that [illegible] is found that, at the high speed now at present being run in passing, the whole width of the road is used. In fact, on our main roads we have now arranged to increase the width of the hardened surface from [illegible] to 18 ft.

One objection to the V drain is the fact that, owing to the extra depth of stone at the centre of the road, the frost action is greatest at that point and the edges where the drain is shallowest and the [illegible] able distortion is occasioned in the road surface. When the frost enters the ground the edges of the road are raised more than the centre, with a resulting convex surface. [illegible] the frost is melting and the water drains out [illegible] an exaggerated camber. The [illegible] damage to a surface [illegible] bituminous matrix, but the more rigid forms of surfacing would be [illegible]

Because of these inherent defects in the V drain, we have for several years been building stone foundations with a flat [illegible] clay or silty material which would work up into the voids of the stone foundation. We first place over the a bed of sandy gravel (when such material can be obtained, varying in the [illegible] may require—in some places 6 in., in others 12 in.—and over this stone fragments not exceeding 8 in. in their largest diameter. The depth of this stone foundation is never less than [illegible] on the edges; under extreme conditions we have used 18 in. in the centre and [illegible] No attempt is made to place these stones as a paving, though some care is taken to lay the bottom stones on their broadest face to ensure a substantial bearing. This, I am aware, is contrary to the theory that a stone laid flat will tilt and cause trouble, and that the usual practice is to place telford stone on edge; but, without discussing the matter further at this time, I can assure you we have built many miles in this manner without trouble. Small stones are thrown on top to close the surface crevices, and the whole is then rolled with a steam roller until hard and firm. This thorough rolling we believe to be one reason for freedom from trouble due to tilting stone. If a bituminised surface is to be placed on the road the voids of the sub-base are filled with clean, sharp [illegible] This is rolled without wetting, and any surplus that remains on top of the base is swept off. This sand filling, however, is not an essential part of the base, but is used only to prevent the loss of bitumen. Bleeders are used to drain the water from this foundation at [illegible] build these outlets as to avoid future clogging.

Foundations of this description have a fairly uniform frost action, appear to be preferable to the V drain, and have been satisfactory.

CONCRETE FOUNDATIONS.

In a district of wood [illegible] expensive types of surface are to be used a concrete base is accepted as the best practice.

There is some difference of opinion as to whether it is better to build a fairly light base of strong concrete (mix of 1 2 4 in [illegible] or heavier mix 5 or 6 inches, or a leaner mix 1 3 6, 1 4 8 [illegible] smaller proportion of cement. Conditions should decide this. In a mixed soil better results might be obtained by the [illegible] there would be less frost action at the greater depth, and the increased depth of the concrete slab should more than offset the loss in tensile strength of the material.

Of course, if it is planned to build a concrete road surface with the ultimate idea of surfacing it at some later time with bitumen or other material, there is no room for argument as to the use of a rich mixture, as it is then necessary so to mix your concrete that it will withstand the abrasion of the traffic. If the bituminous surface is to be only a light one, it is still advisable to use the rich mixture, as the shock of the passing traffic many cause enough surface disintegration to destroy the bond of the bitumen to the concrete.

Illuminating Engineering Society.—A meeting will be held at the Royal Society of Arts, John-street, Adelphi, London, on Tuesday next, the 16th inst., at 8 p.m., when a discussion on "The Development and Design of Lighting Fixtures in Relation to Architecture and Interior Decorations" will be opened by Mr. F. W. Thorpe.

SWANSEA EXTENSION AND SEWERAGE SCHEMES.

Major C. E. Norton last week held an inquiry on behalf of the Local Government Board into applications by the corporation of Swansea to extend the borough boundaries, and to carry out a new scheme of main sewerage with an outfall off the Mumbles Head into the Bristol Channel, at a cost of about £350,000. Major Norton was assisted by Mr. Fryer, inspector of the Board of Trade.

It was stated by Mr. Honorata Lloyd, [illegible] report appearing in the *South Wales Daily News*), who appeared on behalf of the corporation, that the sewerage scheme was considered to be absolutely necessary in the interests of public health. Everyone, he said, agreed that the present state of affairs was one that could not be tolerated, and must be remedied. Counsel proceeded to describe the present scheme, and to compare it with that which was rejected by Parliament in 1912. By means of a cartoon he described the districts it was proposed to deal with, and showed how it was proposed to bring the drainage of an area computed eventually to have 250,000 inhabitants along the Mumbles road to an outfall in the Bristol Channel at the Mumbles Head. He said he would show that the people concerned had not only considered it, but looked on it with favour.

Mr. Midgley Taylor, of Westminster, consulting engineer to the corporation, then gave evidence in support of the scheme. He said that Swansea was one of the finest points of discharge for crude sewage so long as a proper outlet could be got. It was, indeed, infinitely superior to any single outfall at any other resort on the South Coast, including such places as Bournemouth and Brighton. The true tide of the Bristol Channel swept round the Mumbles Head, and the sewage was going to be discharged into the true tide, which was the finest discharge one could have. The tide flowed longer westerly than easterly, which was a distinct advantage to Swansea, enabling the saving of money in the size of the storage tank. He had not, he said, arrived at his present recommendations without exhausting every other conceivable scheme.

Mr. Taylor dealt with the various areas outside the borough it was proposed to drain, showing that the bulk are at present undrained. In regard to the storage and discharge, he had tried in every way to meet every legitimate fear of the inhabitants of the Mumbles and those interested in the oyster fishery, and consequently he had provided for the storage of the sewage in chambers excavated in the solid rock during such hours as it was not advisable to send it into the tide. He had made generous allowances to meet the susceptibilities of the most fastidious—quite beyond what was necessary—and he was confident that the people in the districts affected would be infinitely better off than now.

Cross-examined by Mr. Balfour Browne, witness said he proposed to discharge for four hours and close for eight and a-half hours.

In the course of the proceedings Mr. Morley Samson, who appeared for the Gower Rural District Council, stated that the parties he represented had arranged terms with the corporation, who had given an undertaking that if the proposed sewerage scheme proved unsatisfactory or a nuisance, it would carry out such further necessary works as the Local Government Board might direct.

The inspector said if the Local Government Board considered the proposed outfall would in any way be a risk to the oysters the interests of the district council would be amply protected.

Stockport Water Supply.—The new covered service reservoir of the Stockport Corporation at Alderley Edge was inspected by the Waterworks Committee recently, and afterwards the chairman (Alderman A. Johnson) opened the inlet valves and allowed the water to flow into the reservoir. This reservoir, which has been designed by the water engineer, Mr. T. Molyneux, who has also superintended the carrying out of the work, is the last of the constructional work necessary to utilise fully the Kinder reservoir. Its purpose is to supply the southern portion of the Stockport water area, which includes the districts of Alderley Edge, Wilmslow, Styal and Handforth, and it has been so arranged as to avoid all pumping. The water flows by gravitation into the new reservoir along a pipe line 10½ miles in length, and the work has taken two years to carry out.

Institution of Municipal and County Engineers.

MEETING IN METROPOLITAN DISTRICT.

An animated discussion followed the reading by Mr. H. D. Searles-Wood, F.R.I.B.A., of a paper on "Building By-laws and a Court of Appeal" at last Friday's meeting of the Institution of Municipal and County Engineers. The meeting was held in the institution offices, 92 Victoria-street, Westminster, the chair being occupied by the president, Mr. J. S. Pickering (Cheltenham), and those present including Messrs. W. N. Blair (St. Pancras), J. S. Brodie (Blackpool), Chas. Brownridge (Birkenhead), O. Cattlin (Holborn), A. E. Collins (Norwich), A. P. I. Cotterell (Westminster), W. H. A. Court (Leicester), H. Cubitt (London), R. E. David (Llantrisant), W. R. Davidge (Lewisham), A. Dryland (Surrey), W. Fairley (Westminster), C. F. Gettings (Worcester), S. S. Gettings (Tring), A. Gladwell (Eton), H. S. Graves (Chelsea), W. H. Grieves (Sutton), O. Hilton (Houn-low), Chas. J. Jenkin (Finchley), J. H. Jevons (Hertford), G. Kershaw (Islington), P. G. Killick (Finsbury), H. J. Marten (London), E. B. B. Newton (Paddington), Frank Roberts (Worthing), Norman Scorgie (Hackney), T. Reader Smith (Kettering), W. Stubbs (Blackburn), R. J. Thomas (Buckinghamshire), S. G. Turner (Richmond), H. T. Wakelam (Middlesex), J. A. Webb (Hendon), F. Wilkinson (Wimbledon), E. Willis (Chiswick), and O. E. Winter (Hampstead), members; and W. Douglas (Southampton), O. C. Hills (London), H. D. Searles-Wood (London), H. Shepherd (London), and H. J. Tingle (London), visitors; and the consultant secretary and secretary. Apologies for non-attendance were read from Messrs. H. Percy Boulnois (Westminster), A. D. Greatorex (West Bromwich), and T. W. A. Hayward (Battersea). The paper on "By-laws and the Housing Question," presented at Hinckley on October 3rd last [see The Surveyor, October 16th], also came under the consideration of the members.

BUILDING BY-LAWS AND A COURT OF APPEAL.

By H. D. Searles Wood, F.R.I.B.A.

The resolution that was passed at the Royal Sanitary Institute Congress in 1913 was: "That the council of the Royal Sanitary Institute be requested to urge on the Local Government Board the desirability of the establishment by the board of a tribunal of appeal from the decisions of local authorities on points relating to practices in the working of the building by-laws, and, should they consider that Parliamentary sanction is necessary for the formation of such a tribunal, to take steps to obtain such sanction."

I have been asked to read a paper on this tribunal of appeal, and I gladly avail myself of the opportunity, as I think that there is in some minds a misapprehension of the purpose for which this tribunal is to be appointed. The suggestion was that, in the event of a difference of opinion arising between the authority and the building owner as to the suitability of his design and the construction of the by-laws, the building owner should forward his drawings to the Local Government Board, with a statement of the argument he put forward why the local authority should pass them, and the local authority should state their reason for objecting; the decision of the Local Government Board should be binding on all parties, and there should be no reason why the matter should not be dealt with promptly and with little trouble. I am aware that the Local Government Board always decline to give a legal interpretation, as that is a matter that the courts must settle, but this reference that I suggest would in most cases be as to the reasonableness of the objections, and would not necessarily involve the legal construction of the by-laws, but simply the usual reading of it, with which the Local Government Board would be familiar.

It appears to me that such a tribunal would be more impartial than any local court, and, being a technical body, the decisions would carry more weight, and in course of time these decisions would form a series of precedents which would be of great assistance to both local authorities and building owners.

There has been a tribunal of appeal in the London Building Acts for many years, and it is constituted in the 1894 Act as follows: "One member shall be appointed by a Secretary of State. One member shall be appointed by the council of the Royal Institute of British Architects. One member shall be appointed by the council of the Surveyors' Institution. No member or officer of the council (*i.e.*, London County Council) shall be a member of the tribunal of appeal. Members of the tribunal of appeal shall be appointed for a term of five years, and any such member shall be eligible for reappointment. It shall be lawful for the Lord Chancellor, if he think fit, to remove for inability or misbehaviour, or other good and sufficient cause, any member of the tribunal of appeal.

"Upon the occurrence of any vacancy on the tribunal of appeal, or during the temporary absence through illness or other unavoidable cause of any member thereof, a Secretary of State, the council of the Royal Institute of British Architects, or the Council of the Surveyors' Institution (as the case may be), whichever of them shall have appointed the member of the tribunal whose place shall be vacated, shall appoint forthwith a fit person to be a member (either temporary or permanent) of the tribunal, in lieu of the member whose place is vacated, or who is temporarily absent as aforesaid.

"Each member of the tribunal of appeal shall be entitled to such remuneration, either by way of annual salary or by way of fees, or partly in one way and partly in the other, as a Secretary of State may from time to time fix.

"It shall be lawful for the tribunal of appeal to appoint such clerks, officers and servants as they may find necessary, who shall be paid such salaries as shall be determined by the council, and to provide offices and to obtain such professional advice and assistance as they may find necessary.

"It shall be lawful for the council (*i.e.*, London County Council) to defray the expenses of supporting any decision of the council or of the superintending architect, or of their engineer, or of a district surveyor by counsel and witnesses before the tribunal.

"It shall be lawful for the tribunal at any time to state, and the tribunal shall, if ordered by the High Court, or a judge thereof, on an application in a summary manner of the High Court on any question of law involved in any appeal submitted to them. The High Court shall hear and determine the question or questions of law arising on any case stated by the tribunal of appeal, and shall thereupon reverse, affirm, or amend the determination (if any) in respect of which the case has been stated, or remit the matter to the tribunal of appeal with the opinion of the Court on the case stated, or may make such other order in relation to the matter as the circumstances of the case require, and may make such order as to the costs of the case and in the High Court as to the Court may seem fit.

"The tribunal of appeal shall, subject to the provisions of this Act, have jurisdiction and power to hear and determine appeals referred to them under this Act.

"For all the purposes of and incidental to the hearing and determinations of any appeal, the tribunal shall, subject to any rules of procedure duly made, have power to hear the council (London County Council) and the parties interested either in person or by counsel, solicitor, or agent, as they may think fit, and to require the production of any documents or books, and to confirm, or reverse, or vary any decision, and make any such order as they may think fit, and the costs of any of the parties to the appeal, including the council, shall be in the discretion of the tribunal.

"The tribunal of appeal may, from time to time, subject to the approval of the Lord Chancellor, make regulations consistent with the provisions of this Act as to the procedure to be followed in cases of appeal to the tribunal, including the time and notice of appeal, and as to fees to be paid by appellants and other parties.

"Any order of the tribunal of appeal may be enforced by the High Court as if it had been an order of that Court.

"All fees and sums of money paid to the tribunal of appeal shall be paid over to the council and carried to the county fund, and the salaries or fees payable to members of the tribunal, and the other and establishment expenses of the tribunal, and ex-

[illegible] to be [illegible] and the [illegible] to [illegible] to be determined out of the [illegible] mind.

I have set out these reasons in full so as to give some idea of the way the tribunal of appeal under the London Building Acts is constituted. I do not suggest that it should be a precedent for the tribunal of appeal for the Model By-laws, but it has been found to work well in London.

One of the points for discussion might well be as to the way in which the tribunal should be constituted.

With regard to the arguments in favour of such a tribunal, it seems to me, judging by many of the suggestions that are made in papers on the amendment of the by-laws, that there is a wrong impression of the principle upon which by-laws are founded. We are a free people, and there is a common law right for every man to build as he likes on his own land.

The very interesting *Liber Albus* of the City of London, a collection made during the [illegible] of Sir Richard Whittington of documents [illegible] ancient, contains FitzAlwyne's "Assize of Buildings," written in 1189. It has the following [illegible] obstruction of the view from windows: "If any person shall have windows looking upon his neighbour's land, although he may have been a long time in possession of the view to such windows," it is said, nevertheless his neighbour may lawfully obstruct the view from such windows by building opposite the same, or by placing anything there on his own lands in such manner as may be [illegible] most expedient, unless the person who has such windows can show any writing by reason whereof his neighbour may not obstruct the view from those windows." This shows that the right to build as the owner liked existed in those days.

The by-laws are only concerned with the safety of the public, and not of the owner. This is shown by the exempt building clauses, which to some extent are wider in the Metropolitan Building Acts than in the Model By-laws. Before 1875 the by-laws only regarded the safety of the public from two standpoints—that is, fire and stability. After the Public Health Act it was recognised that the sickness of the occupier might be a menace to the public, and the sanitary aspect was added to the other two. The Amended Rural By-laws, recently issued, which were based largely on suggestions made by the Royal Institute of British Architects, clearly show the three points of view of the safety of the public. As I read the suggestions made in the various papers to amend the by-laws, this is not the idea of their authors, but they want to make the building by-laws a complete code of building construction, which is impossible. The Local Government Board have at present before them the London County Council By-laws for Reinforced Concrete Construction, which, when approved, will, I think, be largely used all over the country for reinforced concrete regulations. Anyone who makes a careful study of these rules will at once see that they require very expert knowledge to construe them, and that it would be hopeless to take a dispute as to whether the design objected to was properly designed before the local courts. And it is with this in view that I strongly urge the formation of an expert tribunal that could give an unbiassed opinion that would carry weight in such disputes as are certain to arise. I am quite ready to admit that the knowledge of the stresses and strain in buildings has improved very much of late years, and the ability to calculate these reactions is possessed by a great many officials; but as this form of construction is rapidly coming more and more to the front, and ingenious forms of its application are constantly being designed, it is difficult for those officials who have so many other duties besides building surveying, to keep abreast with the times. Experience in the carrying out of this form of construction is very essential to the appreciation of new forms of design.

Some people are of the opinion that the time has come when there should be a general Building Act for the whole country. Let us hope if this comes to pass that it may be so drawn as not to stereotype existing methods of construction, but stimulate new and better methods than at present. It might be a good thing to encourage architects to work out the strains and stresses in their structures by making a law that the methods of calculating the designs should be submitted to the district surveyor, and if found correct the construction should be allowed. [illegible] and [illegible] with all these [illegible] and [illegible] to [illegible] party [illegible]

The rules laid down in the Metropolitan Building Act of 1854 for dealing with the rights of the building and adjoining owners of a party wall have worked so well that it is surprising no other city or town has adopted the same system, which is briefly as follows:

When a building [illegible] party wall is to be rebuilt, the building owner serves on the adjoining owner of the party wall notices, which describe the work that is to be done to the party walls, and in this notice the building owner appoints a surveyor to represent him. If the adjoining owner does not agree within fourteen days of the service of the notice, a difference is said to have arisen, and the adjoining owner appoints a surveyor to represent his interest, and these two surveyors meet and appoint a third surveyor.

The first two surveyors then examine the party structure and draw up an award, in which is set out the work that has to be done, and when this [illegible] and the matter is settled. Should the two surveyors [illegible] to agree [illegible] the third surveyor is called in, and within seven days he has to appoint a day for a hearing, and the three surveyors [illegible] which, when signed by the two, is published and becomes a binding document, only to be upset on appeal before a magistrate. The position of the third surveyor is not quite that of an arbitrator; he is only equal in rank to the other two surveyors; but it has been found to work well, and many awards are made by means of the third surveyor which could not be made between the two surveyors in the first instance.

The third surveyor, being quite impartial, can complete the award which one of the interested surveyors would not care to sign. This method of dealing with a difficult situation is really a great help to architecture, and some such system should be part of the statute law. At present the law on the subject is that the party structure is common with the two parties, the building and the adjoining owner; it cannot be touched without the assent of both parties, and there is no means of compelling this consent. It is in this respect that the London practice has such great advantages.

The term "party wall," though often used merely with the signification of a wall separating adjacent buildings, means in its general sense and is properly applicable to any wall which parts or divides adjoining lands, whether built upon or not, held by different owners with regard to ownership and rights of user. The term may be used in four different senses. It may mean:

(1) A wall of which the adjoining owners are tenants in common.

(2) A wall divided longitudinally into two strips, one belonging to each of the neighbouring owners.

(3) A wall which belongs entirely to one of the adjoining owners, but is subject to an easement or right in the other to have it maintained as a dividing wall between the two tenements.

(4) A wall divided longitudinally into two moieties, each moiety being subject to a cross easement in favour of the owner of the other moiety.

But the most ordinary and primary meaning of the term is a wall of which two adjoining owners are tenants in common.

The common user of a wall separating adjoining lands belonging to different owners is *primâ facie* evidence that the wall and the land on which it stands belong to the owners of the adjoining lands in equal moieties as tenants in common; and when a wall has been erected at the joint expense of adjoining owners, and held and used by them in common, it seems clear that, in the absence of evidence to the contrary, a jury would be directed to find that the wall and the land on which it stands are held by the two owners as tenants in common. In the first case the defects of the law as it stands are that nothing can be done to the wall without the consent of the adjoining owner, and there is no power to compel him to give his consent. If the wall be out of repair and one owner repair it, he cannot compel the other owner to contribute. In the second case, where the wall is divided into two strips, either strip can be removed without the consent of the owner of the other strip, and without regard to the efficiency as a party wall of the other portion;

but there may be a right to lateral support. The right of one house to lateral support from an adjoining house generally has its origin in two or more houses having been built by the same owner at the same time. The right of lateral support may also be derived from an express grant, or it may be claimed by prescription.

When a wall is a party wall in the third sense—a wall which belongs entirely to one of the adjoining owners but is subject to an easement or right in the other to have it maintained as a dividing wall—or where a wall is a party wall in the fourth sense—viz., a wall divided longitudinally into two moieties, each moiety being subject to a cross easement—the owner of the servient tenement is not, unless the duty is cast upon him by express stipulation, bound to repair; the easement being for the benefit of the owner of the dominant tenement, it is for him to do the necessary repairs, and it is considered that he will have the right to enter upon the servient tenement for that purpose. But in the fourth case, if either party took down his own moiety he would be liable to an action in respect of any damage which might thereby result to his neighbour.

When one of two adjoining owners builds a house so that one of its external walls stands upon the ground of his neighbour, the owner so building will in due time acquire a title to such wall under the Statute of Limitations, for possession of the house is possession of the wall, which is but a part of the house; but in such a case the owner of the land can at any time before the statutory period has elapsed bring ejectment and recover possession of such site with the wall thereon; but when a man erects a building against his neighbour's wall, utilising it for the purpose of support, and has a covering for one side of such building, he will not by lapse of time obtain a statutory title to the wall, for it does not form part of the building so erected, but is merely an abuttal thereof, and cannot be considered as in his exclusive occupation or possession. But he would, after the lapse of twenty years, become entitled at least to an easement of support from his neighbour's wall for his roof and other analogous rights. A wall may be in part of its length a party wall, and in part of its length an external wall, and there is no distinction between height and length, and the wall may be a party wall up to part of its height, and may be an external wall for the rest of its height.

DISCUSSION.

Mr. E. Willis (Chiswick) proposed a vote of thanks to Mr. Searles-Wood for his paper. He thought a similar compliment had already been paid to Mr. Court. Mr. Searles-Wood was not a municipal engineer, and he was sure they all appreciated members of the allied profession coming to their meetings and giving them the benefit of their experiences. There was one point he would like to mention. He was not aware that the law was such that where a man put up a wall that abutted on his neighbour's wall he acquired a prescriptive right to support after twenty years. He never realised that, although they all studied the law of easements to a certain extent. They had a barrister present among them that evening, and he should like to hear him on that, because it was not fair or reasonable that that should be so. A large part of the paper was simply a description of the London Building Acts, so far as the tribunal of appeal. This was extremely useful for London, but he was not sure that it was quite so useful for the country, where the circumstances were so totally different. In the country they had not got the county councils as the supreme authority, and he was not so sure that they wanted them. He appreciated the county councils and their engineers, and the work they did, but he doubted whether they wanted to throw any more work on them, and to have a tribunal of appeal in the way suggested or outlined by Mr. Searles-Wood. His experience, both in London and the provinces, was probably great; but the problem was—Ought they to have discretionary powers in by-laws? And they must settle that point before they got on to the question of tribunals. The old *Liber Albus* mentioned by Mr. Searles-Wood was extremely interesting, but he noticed there was an entire absence of any mention of the rights of light in the clause he had quoted. The author had said that the by-laws were only concerned with the safety of the public, and not of the owner. He was glad of that, but he thought they very largely covered the safety of the occupier. It was that that the district councils had to consider, and they did occasionally come across youthful architects who were not so brilliant in their qualities as the reader of the paper, and sometimes he had had to have the stresses of girders and columns increased. They would have been absolutely unsafe if he had allowed them to be put in in the form proposed, and the reputation of the architect would have been impaired. He had actually been thanked for pointing out slips of that kind. So he thought they had the safety of the occupier in their hands when examining plans. Then Mr. Searles-Wood had mentioned some of the points with regard to reinforced concrete. He agreed that the time had come when they must have some by-laws, but he thought it was better to sit on the fence until they received the thorough discussion they were receiving in connection with the London by-laws. He did not agree with Mr. Searles-Wood in his statement that it was impossible to make the building by-laws a complete code of building construction; he (Mr. Willis) thought the by-laws should be a complete code. Then there was the suggestion for a general Building Act for the whole country. That would be useful, but he did not think they could get over the fact that what was suitable for one district was not suitable for another—and that was the object of the Local Government Board in revising by-laws for each district. Therefore, if they had a general Building Act for the whole country, there would have to be special regulations governing many of the districts. There was just the question as to the constitution of the proposed tribunal. The first point was to settle whether it was desirable, but he would not discuss that. The constitution of the London authority was very excellent, and its work admirable, and if ever it was considered to be desirable, something on those lines might meet the difficulty. In substance, he thought he was in sympathy with Mr. Court in not cutting down working-class dwellings too much in the matters of the height of ceilings; he would rather increase the sanitary facilities of the cheaper description of houses, and not economise at the expense of health.

Mr. A. E. Collins (Norwich) remarked that Mr. Searles-Wood's paper, with its suggestion of a Court of Appeal on by-laws, was very interesting to anyone who knew what the difficulties were. One wanted to be reasonable, and sometimes they had got to stop things which they regarded as reasonable, because the by-laws had to be administered. He was afraid it was impossible to have by-laws and not carry them out when they thought they ought not to be carried out. If there were a properly constituted Court of Appeal they would be able to insist upon an actual compliance with the by-laws, knowing that they were not inflicting hardship upon anyone, because if the building owner thought the surveyor's construction of the meaning of the by-law was wrong he would have a Court of Appeal to decide the matter. He could not agree with Mr. Searles-Wood as to his proposed tribunal. The county councils throughout the country would be the worst possible Court of Appeal. In the country the county councils had nothing to do with buildings, and it appeared to him the Courts of Appeal should consist of selected persons in the area. In England there might be sixty Courts of Appeal, each dealing with a certain area. He thought the general line of the tribunal of appeal for London would be the sort of thing they wanted for the country generally. The leading men in the parties [illegible] in the paper for London would be elected by the local authorities to form the court. With regard to the by-laws, these would have to vary with the character of the district and the building. That was to say, if they were building a house that stood by itself, with no risk of fire, the by-laws for the construction of walls might be very different to a house built in close proximity to other houses. He thought the latest by-laws of the Local Government Board provided for that kind of thing. There was a different code for rural districts other than that for urban districts. He did not see why one code should not apply to all districts, with different clauses to suit the requirements of each district. The aim of the local authorities should not be to make building impossible by adding largely to the cost of building. The sanitation and the stability of the building should be completely provided for; but with regard to by-laws to prevent the spread of fire, they should depend upon the locality. With regard to the reinforced concrete by-laws, he thought the code the London County Council were working out was the best to adopt, but whether local authorities would adopt such a complicated [illegible] was another matter. They were now

getting [illegible] that the tribunal of appeal in London. Both Mr. Willis and Mr. Collins had spoken as to the tribunal of appeal [illegible] do with the construction of buildings. The right of appeal was as to any powers they had as to the prescribed distance from the centre of the road, any buildings proposed to be erected beyond the general line of buildings and the certificate of the superintending architect as regarded what was the general line of that building, and the certificate of the engineer as to whether the land should be built on or not if it came within the definition of low-lying land. The building by-laws were dealt with by the district surveyors of the several districts, and the London County Council and the tribunal of appeal had nothing whatever to do with that building. If the district surveyor made any requirement upon a building owner, and that building owner did not choose to comply with that request, then the proper course would be for the district surveyor to serve a notice of irregularity, and if the owner did not comply with that then it was the business of the district surveyor to take him before a stipendiary magistrate and not the county council at all. It was not made very clear in the paper, but those of them who had to deal with the tribunal of appeal rightly understood that its province was limited, and it was only such actions [illegible] council or the building owner might be the aggrieved party, that were taken to the tribunal of appeal as the independent authority. While dealing with that tribunal of appeal might he make a remark on Mr. Searles-Wood's statement that "the rules laid down in the Metropolitan Building Act of 1854 for dealing with the rights of the building and adjoining owners [illegible] prising no other city or town has adopted the same system," and, further on in this paper, "that some such system should be part of the statute law"? He should like to ask was 1854 a misprint for 1894?

Mr. Searles-Wood: No, sir; this is the first Building Act—a private Act, not a statute.

Mr. Scorgie said he agreed that the whole of the Building Acts were consolidated by the London Building Act of 1894, and the laws were statute laws, and these dealt with party structures. If there was [illegible] party [illegible] a notice on the adjoining owner. He had a case in which he had to serve notice, as his foundation was going lower, and had to describe the work he was going to carry out.

Mr. Searles-Wood: It only applies to the Metropolis. It is a private Act, and not a statute law.

Mr. J. S. Brodie (Blackpool): It applies to a district.

Mr. Scorgie said it applied to the Metropolis. He agreed with Mr. Willis as regarded the discretionary power in by-laws. He thought that would be a very unwise thing. They knew very well that this country was at present locally governed in small areas, and those of them who had had experience in those small areas knew what influences would be brought to bear upon officials if any discretionary power was given under the by-laws. If they could say "those are the by-laws," they could require them to be carried out, and everything went on smoothly; but if there was power was given, even to the council, they knew what wheels there were within wheels in small areas. He felt it would not conduce to the better government of this country, or better sanitation, or more healthy dwellings, or the health of the people. Regarding reinforced-concrete structures, he, like Mr. Collins, hoped something would be done soon. The Local Government Board had had these present rules of the county council under consideration for some time, but even when they did come back he doubted whether they would conduce to building in reinforced concrete, for he had the authority of architects with experience of these rules for saying that if the rules as forwarded by the London County Council to the Local Government Board were adopted, it would be cheaper for persons to build with brick or stone than with [illegible] be effected under the Metropolitan rules.

Mr. W. R. Davidge (Lewisham) said that as a district surveyor in London he would like to serve Mr. Scorgie with a notice of irregularity with regard to one or two of his remarks. The tribunal of appeal in London has very considerable powers as regarded the construction of buildings. These were not often used, but nevertheless they had the powers, and, as they knew, district surveyors in London were the persons who, in the first instance, prescribed what buildings should be; but, apart from that, the tribunal of appeal have full power. It said much for the architects of London that that power was very rarely used. But the fact that there was that provision was a reason why the law was wisely administered. He thought the paper hardly conveyed what was at the back of Mr. Searles-Wood's mind. But the remarks of Mr. Willis and Mr. Collins had brought out of that proposal something that was more workable for the whole country. As he read the proposal of the author, it was simply a tribunal that would interpret the by-laws, and as he understood Mr. Willis and Mr. Collins, it was to twist that proposal round, so that that tribunal would have some power of revising and altering the by-laws in par[illegible] ward by them, that of Mr. Collins was the more important. If they had power to alter or revise in a particular case, it must not in fairness be left to the local authority; it could only be workable if left to some independent tribunal, as suggested by Mr. Searles-Wood, and very much improved by Mr. Collins' remarks. Something of the kind was workable; but to leave it to the discretion of the smaller authorities was unthinkable and impossible in working. The great distinction and the principle he thought they ought to keep in view was to discuss the possibility of varying the by-laws in any particular case, and the best means of bringing that about. It was, he thought, agreed that the local authority ought to have definite rules to work on, but these should be relaxed to meet the circumstances of certain districts. On the Continent and in the Colonies it was customary to divide the districts up into zones, instead of having a cast-iron system of by-laws. A tribunal was undoubtedly what they ought to aim at. The point that ensures the smooth working of the London Building Act was the presence of this tribunal of appeal. The tribunal was talked about very much, but did very little work, for the number of cases in twelve months could be counted easily on the fingers of one hand—two or three cases was well within the average. When they considered that the number of buildings and alterations dealt with by the district surveyors every year was somewhere about 40,000, they would, he thought, see the great advantages of having the tribunal. [Mr. Scorgie: How many of those 40,000 would it be possible to take to the tribunal of appeal?] He thought it fair to say that the powers of the tribunal were limited, but not so limited as Mr. Scorgie suggested in his original remarks. But the discretionary powers Mr. Scorgie regarded as better vested in the tribunal, and not the county council, which, after all, outside London was not the building authority. They had in London practically a composite system. The county council were the court of appeal, and could allow modifications, and the tribunal of appeal to whom the public could appeal in the case of what they considered unjust treatment by the London County Council, or the district surveyors. They realised that London was different, and the Building Act of 1189, mentioned by Mr. Searles-Wood, was, after all, only one of a long series of Acts which had led steadily down 1,725 years. It might [illegible] provisions in the by-laws—such as that dealing with parapet walls through roofs—dated back to 1707, in the time of Queen Anne, when the only provision for dealing with fires was the village squirt, and it was time these provisions were overhauled. Another provision related to the setting back of window frames and reveals. They could learn a lot from the London practice, and also what to avoid, and he thought that meeting would do well to confine its discussion to the ideal set out by the author, and especially the ideal elaborated by Mr. Collins. If it was possible to vary by-laws, they were all agreed there were many cases in which they should like to see that done, but he did not see how they could allow small authorities the power of discretion. Something in the nature of a tribunal was, he felt sure, the eventual outcome they ought to aim at—not a tribunal to in-

terpret by-laws, but a tribunal to alter by-laws to suit particular cases.

Mr. T. READER SMITH (Kettering) said that, as a country member, he should like to have some tribunal to which disputes as to the interpretation of by-laws could be referred, but he should be sorry to see that body the county council. Members of county councils were mainly country gentlemen with no interest in or knowledge of building. They did not always get on with these councillors as smoothly as they might, and they would not like to have this further bone of contention introduced. He thought they would prefer the Local Government Board. With reference to Mr. Court's paper, he had been making visits to housing schemes, and it might be interesting to state that all those he had seen had been carried out under the ordinary by-laws, and no one thought they had been badly hit by them. He should be sorry to see the height of rooms reduced, or walls of less than 9 in. between himself and the weather; he should personally prefer it to be 11 in., with a 2-in. space between the bricks.

Mr. C. J. JENKIN (Finchley) stated, in regard to the question of discretionary by-laws, that at a meeting of the Town Planning Institute a short time ago it was unanimously agreed that, although in some cases these discretionary powers were advisable, it was fatal to put that power in the hands of local authorities. By the very virtue of their constitution they were not suitable to be a tribunal in their own district. There were cases in which it was very difficult to know what to do, especially in by-laws which were ambiguous. One could not build properly without good by-laws, and he had never seen one code which was good from beginning to end. On the question of discretionary powers he had heard many builders say that they would rather go into certain districts where the surveyors understood the by-laws, and carried them out, than they would build in districts where the by-laws were interpreted by the officials. He knew that every official tried to be fair, but he knew of cases of glaring unfairness, where the official had decided in one way in one case and differently in another. For that very reason the doubt that existed in people's minds would prevent building taking place in certain districts. If they had a tribunal in the hands of some impartial body like the Local Government Board it would be very helpful and useful, but to give discretionary powers to local authorities was highly undesirable.

Mr. S. G. TURNER (Richmond) said he was unable to appreciate the subtle distinction to be drawn between a private Act of Parliament and a statute. A private Act and a public Act were equally statutes, and a by-law, although not a statute, if properly made and confirmed, had just as much force as a statute. It was just as well, in discussing by-laws, that that point should be borne in mind. There was this distinction, however, between a by-law and an Act of the Legislature: No one could question the power of Parliament to pass any Act it liked; but in the case of a by-law, if it were not within the powers given by the statute under which it was made, it could be declared void by the courts. With regard to by-laws, three kinds of questions might arise: First, as to the validity of the by-law itself — that was a question of law; second, as to the interpretation of the by-law—that again was a question of law; third, as to whether, in any given case, the requirements of the by-law should be dispensed with. The questions which went before the tribunal of appeal in London were either questions relating to the building line or to the construction of public buildings, in regard to which there were no by-laws or statutory provisions, the matter being within the discretion of the district surveyor. Only if there were no by-laws, or if the by-laws could be dispensed with, would there be any work for the proposed by-laws appeal court to do. He doubted whether a discretionary dispensing power would be advantageous to the municipal engineer. It would cast a great responsibility upon him. It occurred to him also that there would be a considerable addition to the responsibilities of local authorities if they had powers to dispense with the by-laws; but there was room for some independent tribunal to which some power of dispensation might be given. With regard to by-laws and housing, one speaker had said that in most cases local authorities conformed with their by-laws. It was a more remarkable fact, however, that some authorities had not done so, thus acting quite illegally. Local authorities had no more power to dispense with the by-laws than the private builder. He was not at all sure that the very difficult question of dispensation could not be solved on lines something like those suggested that night by creating an independent tribunal covering a large area, to which, in exceptional cases, some kind of appeal might be made.

Mr. J. S. BRODIE (Blackpool) said throughout the discussion he had been much surprised to find a kind of tacit consent among members that there was no such thing as a tribunal of appeal outside London; but, seeing that he had on two separate occasions been hauled up before such a tribunal, he knew that it existed. In the course of his career he had twice appeared in a Court of Quarter Sessions to show good and just cause for the reason that was in him for saying that he could not allow the authority to pass the plans. In both cases, after a lengthy hearing and all manner of hard swearing, he was pleased to say that that Court of Appeal gave a decision in his favour, and he was very grateful to them. That much for existing practice. Further, he would like to say, with regard to a point Mr. Turner had touched upon, as to local authorities having to observe their own by-laws, he dared say everyone present knew that the public authorities, when they were allowed, were the worst sinners in the breaking of by-laws—worse even than the most disreputable of owners. He, on one occasion, advised his people they could not do what they were going to do unless they broke the by-laws, and he told them he would not be a party to breaking the by-laws. They put the case before the Local Government Board, and got a dispensation from the board to set aside the by-law. That was a distinct case of their own. Now, with regard to the discretion, all he could say was that those who were advisers of local authorities knew that quite enough discretion was taken without giving the authority. If they began giving them something no one knew where it would end. He would give no discretion at all, but would lay down a hard-and-fast rule; so far as he knew, no public authority could do anything of the kind. He heard the remarks of Mr. Searles-Wood with regard to party walls with the greatest pleasure. After all the question of party walls largely depended upon the conveyance of the land, and the landowner, if he was wise, put in his covenant a provision that cleared up the question of party walls for once and all. The law seemed very uncertain as to what they could do, but if the selling owner put it in his covenant how it was to be dealt with, then there was no further difficulty in the matter. There was the general question as to what by-laws were made for. He always thought by-laws were made, first of all, for the protection of the occupier, and he very frequently needed protection from certain builders; then there was the protection of the general public, and, of course, protection of the neighbours of the house in question. They had these three classes of persons to consider. They had to see that the occupier had not the roof falling about his ears; they had to see that the public did not get their heads cracked; and they had to see that the house did not fall upon the neighbour and kill him. These were all reasonable things. The general law of England was that a man must so carry on his business—whether it was building houses or anything else—so as not to be an injury to his neighbours. In regard to the complete code of building construction, he hoped they might be preserved from anything of that kind; that would be one of the greatest mistakes they could make. It would shut out all enterprise, make everything to a stereotyped pattern, and they would be in the position of the unhappy Germans if they attempted anything of the kind.

Mr. H. T. WAKELAM (Middlesex), speaking for representatives of county councils, said they were the last people who desired to have anything to do with building by-laws. He had had something to do with the construction of by-laws, and he knew the difficulties they had to contend with. It was not always a pleasant thing to construe them, and the manner in which the builders desired to construe was one with which he could rarely agree. He could assure them that the county councils did not want to be the authority for by-laws. In his work at Middlesex there were 600 buildings they had to license for stage plays, dancing and music. The condition he always made was that they should bring him the certificate of the local authority, and let them know that their by-laws were complied with, because if they were according to the by-laws Mr. Willis had to administer he was satisfied that they were in

[illegible]. With regard to the construction of the [illegible] he thought the Local Government Board were on the right lines. One speaker said that did not have many appeals to make, either to the [illegible] the courts, [illegible] the appeal authority, which he supposed he [illegible] would not have many appeals made to them. With regard to reinforced concrete buildings he thought something should be done with the class of building which was springing up on all sides in Middlesex. This should be done if it was only to satisfy the public that they [illegible]. At present the public were not satisfied and [illegible] of these buildings were [illegible]. Personally, he thought some regulation should be framed by the Local Government Board and experts brought together, and definite lines laid down with regard to these buildings, and the regulations with which they must comply. He was absolutely in agreement with Mr. Brodie that there should be no [illegible] with anything in the byelaws. He knew what the trouble was in regard to buildings. They had in Middlesex standing orders, and there were [illegible] and they were the bane of his life.

Mr. F. Wilkinson (Wembley) said he was [illegible] with a [illegible] and not concrete, with the byelaws. The [illegible] stated that under the Education Act it was necessary to comply with the by-laws if the Board of Education passed it. That was an [illegible] Department breaking the by-laws which they had in force. As regarded reinforced concrete, he thought generally that rules for calculating the stresses ought to be adopted all over the country. If one did adopt rules, and could enforce the architect to give the loads he proposed to carry, one could in a decade without [illegible] were suitable or not. Wimbledon being a residential district, the troubles they had had with architects had been solely with regard to the height of windows and as to what was a two-storied building. He had not experienced much trouble with the first, and had had a great deal with the other. A certain section of architects wanted very low windows indeed, and he did not agree with these at all. As to the tribunal of appeal, he did not think that would be very helpful to surveyors in the country. He agreed that by-laws should be harder even than at present, for when one had to deal with councillors—many of whom were not technical men—one had to press very hard sometimes for by-laws to be carried out. They had been revising their by-laws for some time past. The by-laws now in force were passed in 1881 by the Local Government Board. Recently he had sent to him the new by-laws of another district, and on looking up a certain question which would be very helpful to them, he found that their old by-laws were even more drastic than the new by-laws passed by the Local Government Board for a large town. Consequently they had not very much to improve if these particular by-laws were the most recent and best in the country.

Mr. Searles-Wood, in reply, said he was rather amused to be [illegible] though he was a member of another profession. He was for twenty-five years a district surveyor, a member of their own profession. He would like to point out to Mr. Turner that the Act of 1909 gives a considerable amount of waiving for certain things. They were all constructional points, in regard to steel framings, and the same thing with regard to reinforced concrete. In the skeleton iron framing they could always ascertain the strength of a building, but when the framing was covered with concrete it was very difficult to tell what the strength of the building was. That was why they wanted such careful regulations.

Mr. Corry also briefly thanked the members for the manner in which they had received his paper.

Montreal Water Supply.—The Canadian Bitumastic Enamels Company, Limited, Montreal, the agents for Wailes, Dove & Co.'s "Bitumastic" materials, have secured the contract to clean and apply "Bitumastic" enamel to the interior surfaces of the emergency intake water pipe for the city of Montreal. This pipe is, approximately, 1,400 ft. long by 8 ft. in diameter, and was built to prevent a water famine such as the city experienced in 1913. The American agents for the same materials secured contracts for the city of New York and the city of Baltimore.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

When will "the authorities" make an attempt to standardise the hand signals used by drivers of road vehicles? Would it not be simple, as suggested in the *Royal Automobile Club Journal*, to fix the signals somewhat as follows: (1) A turn to the right—the arm of the driver extended at a rigid right angle; (2) a turn to the left—the arm to wave the overtaking traffic past the driver who is signalling—*i.e.*, a sweep of the arm encouraging the vehicle behind to pass; (3) a stop to be indicated by the driver extending his arm with the forearm bent at the elbow, so that the hand is in a vertical position? Would not these simple signals very soon be acted upon, and thus avoid what is now nothing but confusion?

Will anything come of the recent horseshoe competition and the prizes awarded by the Roads Improvement Association? Or will custom and prejudice, as usual, stand in the way of improvement, and our roads still suffer from the cogs, or calkins, and toe pieces which are so detrimental both to the surface of the road and to the horses themselves?

Is it true, as was remarked by a learned man a short time ago, that the world is without an astronomer at the present moment? Was he correct when he asserted that of "star-gazers" there were plenty, but of discoverers in the great, and almost mystic, science of astronomy there were none? Is it not true of nearly all sciences that observers are required, but that there would be little progress without imagination?

Shall we not all agree with Mr. Oscar Kirby, after reading his excellent paper on "Extraordinary Traffic," set forth in the issue of The Surveyor of the 5th inst., that Parliament should, if possible, define the nature and quantity of traffic to permit of its being converted from "ordinary" to "extraordinary"? If this consummation could be reached, would it not tend to lessen the enormous amount of work which a surveyor now has to go through in order to prepare the necessary evidence and particulars for each case of this kind that comes before the courts? But then, how would solicitors and counsel like such simplicity?

Is not Mr. Norman Scorgie to be congratulated on his excellent presidential address to the Society of Engineers? Does not such an address tend to stimulate the municipal engineer to further exertions to make his work larger and more imperial, and "to make his advice to his council a source of strength and not a string of platitudes"? Would not the profession of the municipal engineer benefit considerably, and be more honoured if we could all take to heart the excellent advice contained in Mr. Scorgie's address?

Is it a fact, as stated in a recent letter to the *Times*, that the military authorities warned the civil authorities of certain East Coast towns some time ago that German air raids might be expected, and suggested that the diminution of light at night was desirable? Is it also true, as stated, that the civil authorities would not listen to this advice? And would it not be interesting to know if the borough surveyors were consulted on the question, and whether they were allowed to express an opinion on the subject?

Is there not a good deal to be said in favour of Mr. Searles-Wood's suggestion that, in case of dispute with regard to interpretation of building by-laws, the Local Government Board should form a court of tribunal whose decisions shall be final and binding? Would not such a tribunal of experts be more satisfactory than a court of summary jurisdiction, or even a law court, where the tribunal may or may not be expert in the law, but knows nothing of technicalities? In addition, would not the time of municipal officers be less frequently taken up in lengthy litigation, and more fully occupied in more useful work?

Town Planning Institute.—At a meeting to be held this (Friday) evening at 92 Victoria-street, Westminster, Mr. F. M. Elgood, F.R.I.B.A., F.S.I., will open a discussion on "The Land Unit." The chair will be taken at 8 o'clock.

THE HIGH-SPEED GAS ENGINE.

By R. Embleton, Manchester.

A paper descriptive of the construction, working and advantages of the high-speed gas engine, and defining the special fields in which its merits are particularly valuable, was read at a meeting of the Junior Institution of Engineers on Monday.

In his opening remarks the author endeavours to show that, as regards regularity of speed, this class of engine is especially suitable for generator driving. This, however, he pointed out, is not the only qualification necessary, for, particularly in central station work, the engine must be absolutely reliable and able to generate its rated power for long periods without breakdown.

The high-speed gas engine is designed to give its rated power with the comparatively low mean pressure of about 70 lb. per square inch and an initial explosion pressure of about 250 lb.—not much higher than that used in a modern steam engine. Consequently it is able to run for long periods without trouble from overheating or undue fatigue of the working parts, and, if necessary, is capable of dealing with overloads up to about 15 per cent for short periods.

These engines are fitted with a forced lubrication system to all working parts, so there is no reason why they should not run continuously with very little attention. As a matter of fact, there are a large number at work running continuously day and night, with only one short stop at the week-end. In case of breakdown—to which any machinery is liable through bad material or workmanship—all parts are easily accessible. Both pistons and valves can be withdrawn through the tops of the cylinders. If a light crane or runway is fitted overhead, and a few spare parts kept in stock, damaged or broken parts can be easily and quickly replaced, and time lost through this cause reduced to a minimum. The parts most liable to wear and breakage being the piston rings, valves, springs and ignition plugs, an assortment is usually supplied by the engine makers, but in any case they are not costly items to replace.

To maintain these engines in operation it is only necessary to keep them supplied with gas. For small powers this can be obtained from the town's supply, and even for the larger powers this source is preferable in districts where gas is supplied at a cheap rate for power purposes, the only accessory then required being a meter to register the quantity used.

Where town's gas is not available, or too expensive, producer gas is used and generated on the premises by means of suction or other gas plants, using anthracite coal, or coke.

In large installations ordinary bituminous coal is used in the Mond or other gas plants.

A supply of gas being available, high-speed gas engines can be started immediately by simply barring the engine to the starting position and then opening the compressed-air starting cock—no previous warming up being required, as in the case of the steam engine. This quick starting is of great value in certain cases.

SOME ADVANTAGES.

For direct coupling to centrifugal pumps for sewerage, drainage, irrigation or dock work, the ease and rapidity with which these engines can be started up is of great advantage, particularly in installations for the prevention of floods, or in sewage works where, on the extent of a storm, downpour of rain, they can be started up immediately to deal with the flood water and relieve the main sewers. Several large pumping plants have been put down for this purpose by the London County Council, consisting of vertical gas engines coupled to centrifugal pumps, and using town's gas, which is always ready on tap, and as their use is only occasional, and for relatively short periods, the cost of gas does not much matter. In this case the starting air is also used for the priming ejectors of the pumps.

The high-speed gas engine can also be used for almost any of the purposes that the slow-speed engine is used for, the only disadvantage being the matter of price, which is rather higher per rated horse power than is the slow-speed type. But even this fact is largely counterbalanced by the smaller space occupied by the engine and by the smaller buildings and foundations required.

To sum up generally, the advantages of the high-speed gas engine and the fields in which it can be fittingly used are as follows: It possesses all the qualifications of reliability, regularity of speed, and economy of running necessary for the driving of electric generators for lighting or power either in private works, large shops, or in central station work for the public authorities of small boroughs, urban or rural districts. No boiler is required, and no unsightly stack to emit black smoke and pollute the atmosphere. The absence of vibration enables it to be installed in towns or cities without damage to surrounding property, or in urban or rural districts without annoyance to the inhabitants, while it can be installed in neat and artistic buildings in keeping with the style of the districts. It is compact and neat in appearance, and, as it can be direct coupled to the generator, only a small floor space is required with buildings comparatively small for the power generated. Where town's gas is used, it is self-contained, and, with the exception of the starting apparatus and circulating pump, no auxiliaries are required, and the whole plant can be housed in one building. Where a gas plant is used, this can be covered by a cheap lean-to shed on one side of the engine-house. A very little coal goes a long way, an occasional feed with a bucket being all that is required—no laborious stoking, and no constant stream of coal carts that are a necessary adjunct in connection with some steam plants.

The consumption of town's gas is about 20 cub. ft. per b.h.p. hour of gas of a value of 500 B.T.U. per cubic foot, and, with gas at 1s. 8d. per 1,000, works out to ·4d. per b.h.p. hour, or ·6d. per Board of Trade unit. In some towns gas is very much cheaper than this, with a corresponding reduction in fuel cost. Where a gas plant is used, about 1 lb. of anthracite coal per b.h.p. hour is required, this amount covering stand-by losses during short periods when the engine is not working. With anthracite at 30s. a ton, this works out to ·16d. per b.h.p. hour, or ·24d. per unit. In some parts of the country anthracite can be obtained at a very much less figure than 30s.

All the foregoing figures are taken on a full-load basis; with an average of three-quarter load they would be increased by about 10 per cent.

COSTS.

The question of running costs as compared with steam sets depends, of course, to a great extent upon the size of plant, type of engine and boilers—ancient or modern—and the price of coal, which varies considerably in different districts. The first installation of high-speed gas engines with which the author was connected—installed about twelve years ago—is still running, and, he believes, giving satisfaction—will permit a fair comparison being made between the cost of gas and steam sets.

The engines in question were two 4-cylinder gas-electric sets of 180-kw. capacity each, served by two gas plants, and were installed in a station alongside of an existing steam station of exactly the same capacity, consisting of two 180-kw. triple-expansion steam sets with water-tube boilers and superheaters and mechanical stokers.

The total annual cost of the complete coal steam plant was £3,642, and the total annual cost of each set of gas plant was £3,200, a difference in favour of the gas plant of £442. In the steam station, with coal at 18s. 6d. per ton, the total works cost was ·875d. per unit generated. In the gas station, with coal at 18s. 6d. per ton, the total works cost was ·552d. per unit generated. Both sets worked with a load factor of 65 per cent. It will be seen that a difference in favour of the gas set of ·323d. per unit under practical working conditions was obtained in this particular instance with [illegible] plant as compared with coal-fired steam plant of the latest design.

Whitewashing Footpaths.—At the last meeting of the Urban District Council D. Randall moved that consideration should be given to the advisability of whitening street kerbing. Such a proceeding would, he thought, lessen the dangers at present existing, and be of particular advantage to strangers. If all the kerbing could not be done he would suggest that it be done for 25 ft. at each corner. It would help to prevent people stumbling over the kerbs. The matter was referred to the Works Committee, the surveyor in the meantime to bring up a report. The Chairman suggested that if people would walk on the footpaths and not on the roads it would be a great help.

Law Notes.

EDITED BY J. B. REGINIER CONDER, 57 Moorgate Street, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only, should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address. Correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction (i.e., without re-drawing or amendment). *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion queriers are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

CONNECTION OF DRAINS WITH SEWER—REGULATIONS.—"Rural" writes: Can the rural district council, to be bound by the following Regulation, which is one of a series of Regulations made by my council under the Public Health Act, 1875 (s. 21), be legally charged? "2. Any owner or occupier of premises within the above district who intends or is required to empty his drains into the sewers of the council shall give to the surveyor to the council at least fourteen days' previous written notice of his intention to commence the work, and such notice must be delivered in duplicate, with a plan of the case for the surveyor's superintendence, and on a form, copies of which may be obtained on application at the office of the surveyor to the council, between the hours of 10 a.m. and 12 o'clock noon. Every such notice and deposit thereof must be accompanied (1) by a ground plan in duplicate, showing (a) the premises proposed to be drained, drawn to a scale of 1 in. to every 8 ft., (b) the direction of the lines of the proposed drainage, (c) the sizes and construction of the proposed drains, (d) the course of all the surface and underground drains upon the premises; and (2) by a section, in duplicate, drawn to the same scale and showing (a) the proposed drains; (b) the gradients thereof. One copy of such plans and sections will be retained by and become the property of the council.

The section gives an owner or occupier a primâ facie absolute right to cause his drains to empty into the sewers on two conditions only, viz.: (1) Giving such notice as may be required by the local authority of his intention to do so, and (2) complying with the regulations of the authority as to the mode of doing the work. [illegible] subject to the control of some person who may be appointed by the authority to superintend the making of such communications. The regulations are at the entire discretion of the local authority, but they must relate to the matters mentioned in Bambley's Public Health Acts, 8th edition, p. 78). Obviously the above alleged "regulation" does not relate to the matters mentioned in the sections. It cannot therefore be regarded as one of the regulations referred to in the section, but merely as a statement of what kind of notice is required by the authority. There appears to be nothing in the section to authorise the demand of a fee with the notice, and in any opinion payment thereof could not be enforced.

FLOODING OF HIGHWAY.—"J. K. D." writes: A [illegible] has a hedge which during heavy rains [illegible] owing to the water not being able to find its way [illegible] at the gateway. [illegible] rather to the fact that the drains are not large enough to carry the water. I should be obliged if you would inform me whether my council has power to enforce the owners of the land to lay larger pipes or build larger stone drains, taking into consideration that the existing ones are in good condition. It will be necessary, when fresh drains are laid, to lower the watercourse.

It is the duty of the owner of lands adjoining a highway to cleanse and scour his own ditches to such an extent as to prevent nuisances or obstruction to passengers. Accordingly, in *Attorney-General v. Waring* (63 J.P., 789) an injunction was granted against a landowner to restrain him from causing a nuisance and obstruction to a highway by neglecting to cleanse his ditch, and so causing the highway to be flooded from time to time. Where a landowner, for his own purposes, pipes part of his ditch as at a gateway entrance), it would seem reasonable to infer that the pipes must be sufficiently large to prevent a nuisance or obstruction. I can find no authority, however, on this point, which must therefore be considered as doubtful.

CLASSIFICATION OF ROADS: FORM No. 2.—"G. E." writes: In the above form Question 12 is as follows: "Office and establishment expenses of the council (approximately), including surveyor's department—(a) chargeable to district highways and bridges account; (b) chargeable to main road account. (This item applies only to those councils which maintain main roads under sec. II (2) of the Local Government Act, 1888, and to those with whom the county council have contracted to maintain main roads.)" The [illegible] is expressed that under [illegible] the urban district council ought to charge to the main road account a portion of the surveyor's salary, clerk's salary, and of the office and establishment expenses. Will you please say whether the opinion is correct or not? And if so, what power has the council to make such charges? It may be stated that there is no contract between the county council and this council respecting the maintenance of the main roads in this district. The whole of the main roads in this district are maintained by this council, the whole of the expenditure on main roads being charged to the main road account, the county council making a contribution towards the cost.

The difficulty of the form evidently is that [illegible] the establishment charges, including surveyor's department, should be included under paragraph (b), and I think the opinion referred to in the query is correct. The council have power under sec. 2 of the Highways Act, 1878, to raise money for the repair of highways, and this includes everything ancillary to the carrying out of that object. See Pratt and Mackenzie's "Law of Highways," 15th edition, p. 170.

PRIVATE FOOTPATH LAMPS.—"W. I. H." writes: We [illegible] a private proposal to erect a lamp on a public footpath passing through privately owned land. I should be much obliged if you would kindly give me information on the following points: (1) Have the council power to light such footway? (2) Can the owner of the land object to the erection of a lamp, [illegible] any statement be claimed by him?

(1) In my opinion they have. Under sec. 161 of the Public Health Act, 1875, an urban authority may contract with any person for the supply of means for lighting the "streets" in their district, and may provide such lamps, lamp-posts, and other materials as they may think necessary for lighting the same. The expression "street" as used in the Act includes [illegible] any footway, whether a thoroughfare or not. (2) The owner cannot object, or claim compensation. The council have a discretion where to erect lamp-posts, and their discretion will not be interfered with at the suit of adjoining owners, even though [illegible] consequence of such lamps obstructing the access [illegible] premises [illegible] Ch. [illegible].

[illegible] EXPIRE THE HOUSING ACT NOT [illegible]. "J. A. I." writes: "Will you please give me your opinion if a notice served after an inspection under the Housing, Town Planning Act, 1909, is legal, seeing the officer was allowed to make an inspection without having had to serve the twenty-four hours' notice under the Act?

In my opinion a notice to execute works under subsec. (3) of sec. 15 of this Act is not invalid by reason of an inspection having taken place without notice. Under subsec. (3), "if it appears" to the authority that the undertaking implied by subsec. (1) is not complied with, they are bound, if a Closing Order is not made, to give a notice to execute works. An officer cannot inspect until after twenty-four hours' notice if the occupier chooses to stand on his rights. But if the occupier likes to allow inspection without notice, this does not, in my opinion, prevent the authority from acting upon the information so obtained.

DRAINS BY FLOODING.—"L. C." writes: Many thanks for your answer to my query *re* flooding by [illegible]. Do you not think that the fact that the hatch being left open constitutes negligence on [illegible] as he was quite aware that [illegible] would take place as it had happened before?

This is rather a difficult point. I do not think the owner was bound to construct the overflow drain, and if not the question is, Did he, by leaving the hatch open, cause a greater amount of flooding than would have occurred from natural causes before the construction of the drain? If not, I think it is doubtful whether he would be held liable.

HOUSING AND TOWN PLANNING ACT, 1909: PRE 1909 TENANCIES.—"Medical Officer of Health" writes: Is it a fact that, under sec. 14 of the Housing and Town Planning Act, 1909, a rural district council is unable to enforce owners to provide remedies for defects under 15 (3)?

No. In a rural sanitary district the rural sanitary authority is the local authority within the meaning of Part II. of the Housing of the Working Classes Act, 1890, and can therefore proceed under sec. 15 (3) of the Act of 1909.

PRESENTATION TO MR. THOMAS COLE.

The high esteem and affection in which the late secretary of the Institution of Municipal and County Engineers, Mr. Thomas Cole, Assoc.M.Inst.C.E., is held by the members of that body was once more demonstrated on Friday evening last, when at the commencement of the meeting which is reported on another page of this issue he was presented with a cheque for £40 and a gold watch and chain, a bracelet watch for Miss Cole, his daughter, being at the same time handed to him.

In making the presentation, the president, Mr. J. S. Pickering, said it was something like forty-two years ago that there was formed the Association of Municipal and Sanitary Engineers and Surveyors—a body which had advanced in numbers and influence year by year, until at the present time, under a somewhat more dignified title, it had become an institution comprising upwards of 1,700 members. One of the main reasons why the institution had made such progress was that it had been fortunate enough to have as its secretary one who had placed his devotion in the interests of the institution before every other consideration. When Mr. Cole became secretary some thirty-three years ago there were only 200 members, so that he had seen the membership increase eight times. During his long career as their official he had, of course, seen many changes. Many of his old friends had passed away, and there now remained very few of those who were connected with the society when he first took up office. But while the inexorable hand of death had removed many members whose memory they all greatly cherished, time had brought forth a host of new members whose esteem for their late secretary was no less sincere. He (the president) had learnt, as others had done, to regard him, not merely as an official, but as a friend in the highest sense of the word. During his long career he had had the entire confidence of each succeeding council, and he was sure it could be said that he had the esteem of every single member of the institution. That evening it was his privilege to ask Mr. Cole to accept from them a gift in token of their esteem, and with their good wishes for his future welfare and happiness. He hoped that the watch would ever be a reminder to him, and to generations to follow him, that time could not eradicate the good he had done for that institution, and that the chain might symbolise the bond of affection in which he was held by its members. The cheque for £40 was the balance of a limited subscription which had been contributed to by no fewer than 800 members of the institution. The bracelet watch was presented to Miss Cole with a hope that she might wear it as a token of their affection for her father and with sincere wishes that Mr. Cole and those near and dear to him might have a future of unalloyed happiness.

Mr. Cole, who was greeted with cheers on rising to respond, said the kind words the president had addressed to him, and the enthusiastic way all present had endorsed by their applause the latter's most kind and generous speech, filled his heart with such emotion as to make it really almost impossible, certainly very difficult, for him to find words adequate to express his heart's deep gratitude, not only to those present, but to that great concourse of his friends who had presented him with that exquisite memento of their kindly esteem, and for their very generous appreciation of his life's work and service to their beloved institution. Let him at least say that the president's words and the applause of that gathering were an indescribable joy to him, and that, however long he might be spared to live, the proud happiness of that evening, engendered by their appreciation, would brighten the rest of his days, as he felt that this expression of their esteem was not a farewell, but was the treasured testimony of hundreds of dear and valued friends. It was interesting to note that at the date of his joining the institution the number on the roll of membership was about 200. The number on their list now totalled 1,750. He had hoped, within his secretaryship, to see the numbers touch 2,000, but in view of their limited field, and having regard to the strict censorship that was exercised over applications for membership, the present numbers must be considered very satisfactory, especially so when it was remembered that this growth of membership was commensurate with the improvement in the status of the municipal engineer. He had been privileged to see no fewer than thirty-three presidents occupy the honoured chair of the institution, and each one of these had most unselfishly laboured to advance the honour and the prestige of the institution. On a previous occasion he referred with justifiable pride to the past-presidents who had gone before, and whose good work must ever adorn the roll and afford a tradition that would for all time enrich and ennoble the history of their institution. And of those living he might be allowed to mention at least one, Mr. J. A. Brodie, of Liverpool, who was chosen by the Government as the leading authority of the kingdom to advise and assist in the lay-out of the new city of Delhi. He was proud, and justly proud, that his connection with the institution had brought him into contact with such worthy men. There was just one other point he wanted to place on record on quitting his office—that was that the institution was quite well known in the great State departments of the country. Besides the Local Government Board there was the Foreign Office, the Colonial Office, and the Board of Trade. There was the India Office, the War Office, and last, but not least, the Road Board, whose advisory council consisted entirely of members of the institution.

INSTITUTION'S HISTORY AND WORK.

With their permission he wanted to take a rapid glance at the history of the institution. This might be divided under two heads: (1) History Proper—consisting of those changes in the constitution of the institution which had generally contributed to its development, its expansion, and its present important dimensions. (2) The Work of the Institution. Now, with regard to the first section, it must be remembered that when originally constituted the rules of the Association of Municipal and Sanitary Engineers and Surveyors, by which name they were then known, only admitted chief surveyors to authorities under the control of the Local Government Board, which meant England and Wales only. Although this principle was very strongly held and fought for, the party of progress ultimately prevailed, and they accordingly found the rules had become enlarged so as to take in not only the municipal engineers of Scotland and Ireland as well as the Metropolitan surveyors, but the municipal engineers of our Colonial Empire. Next they found that new classes were formed which enabled deputy and chief assistants to be brought in, and finally the aim and object now was to proffer the advantages and benefits of the institution to the whole staff of the municipal engineer. He had intended to take that opportunity of glancing at the events of interest in the history of the institution, but as they had something else to do than to listen to him he would confine the remarks he had to make as to the work of the institution to one or two items only.

SECURITY OF TENURE.

The first was as to protection or security of tenure. Some critics had gone so far as to think or say that nothing had been done in that direction; but, although perhaps little or nothing had been actually achieved, he would point out that the records showed that the institution was actually conceived in the endeavour to obtain protection, and no fewer than three Presidents of the Local Government Board had been petitioned and interviewed. At the initiation of the institution, Mr. Lewis Angell, with the early pioneers, petitioned and interviewed Mr. Stansfeld, the then President of the Local Government Board. Then in 1884 Mr. Angell and Mr. Ellice Clark, in able addresses, presented the case again very forcibly to Sir Charles Dilke, who, as President of the Board, took the chair at their meeting at the Healtheries Exhibition, and, lastly, a deputation of the council interviewed Mr. Burns in 1914. In 1872 Mr. Stansfeld admitted his astonishment at the facts submitted, but opposed the practical experience of the deputation by an academic view that the principles of local self-government, improved sanitary laws, greater public interest in sanitary progress, the spread of education, and an improved constitution of local authorities would in the end accomplish all that the petitioners desired. In 1884 Sir Charles Dilke in his speech, after referring to the case of the Poor-law Officers, sympathetically spoke of the suggestion made at the meeting that there should be something between Government control and purely local control. By changing the county government to the local government system it might be possible to introduce an appeal from one small elective body to another larger authority covering the same area.

The Surveyor
And Municipal and County Engineer.

Things One Would Like to Know	266

That would not have [illegible] object on to which a central London contribution [illegible] and "I have always thought," said Sir Charles, "that it would be possible to give a great number of powers on appeal against the action of small local authorities to a duly representative county authority which might be a proper court of appeal for such purposes." Last year, 1914, Mr. Burns warned his deputation that in seeking protection surveyors to local authorities might possibly be building up for themselves an authority that would cramp their [illegible] and place them in a position with much less liberty than they at present enjoyed. At all events there was brought to Mr. Burns a great mass of evidence of cases of hardship which the institution had collected, and they still went on hoping that some remedy would be found and adequate protection given to surveyors in carrying out the Public Health and other Acts which their really difficult position required. Besides that there was a very great deal of work quietly done by the council and its committees of which little was published or generally known, and which he could only just refer to. For instance, there was standardisation of all kinds—arterial roads, sanitary work, road technique, and questions such as the arbitration clause in contracts, corrugation of tramway rails, and many other matters. Lastly, he would refer to the financial position of the institution, which he regarded as most satisfactory from one item alone, and that was the small amount of arrears of subscriptions. That, he assured them, compared very favourably indeed with other societies, and manifested a very healthy interest by the members in the welfare and progress of the institution.

THANKS TO STAFF.

He must not, and would not, leave his subject without referring to the loyal assistance that had always been given to him by his staff. It was a pleasant duty publicly to tender to Mr. Giles his warmest acknowledgment of his faithful work and most useful assistance in his twenty years' service to the institution. He was only too well aware that much that he had credit for was due to him, and, as much that he did was unseen, he assured them that the institution had much to thank Mr. Giles for in the keen interest he took in all that pertained to the business of the institution. He sincerely trusted the institution might long have his services and his valued assistance. He should like to say that he heartily congratulated the council on their choice of his successor. In Mr. Robinson they had a most able and courteous gentleman, and one who was in every way fitted for the office which he now filled. Mr. Robinson had been most unfortunate, through the exigencies of the troublous times, in losing from the very outset the services and the assistance of Mr. Giles, and had thus been left alone to carry on the complicated work of the office. Mr. Robinson had, he knew, had a hard and anxious time, but he also knew that his ability, coupled with great courtesy, had enabled him to pull through a very difficult time. It was, indeed, he was sure—that the institution and the council would give him that warm sympathy they had always shown himself. Mr. Robinson was there with them that evening. He would see in that delightful function his predecessor's long services crowned with a host of precious friendships, while at the same time he would have the testimony of the institution's most generous treatment of long and loyal service.

FUTURE OF THE INSTITUTION.

Let him say, in conclusion, that he had always had the greatest pride and confidence in their institution. He had the strongest belief that there was a great future before it—that it was one of the most useful and valuable bodies that existed in this country, inasmuch as it had done a great work in improving the status of the municipal engineer, and thereby materially assisted in effecting the diminution of the death-rate of the country. In this alone it had rendered incalculable service to the public weal. Now he gave up his life-work, and, as they might suppose, he gave it up with a bit of a pang. He had done his best well and truly to serve the council and the institution, who had treated him in a most generous spirit—first, by pension, and then, as a special honour, by electing him consultant secretary and honorary secretary with a seat on the council, and for that very exceptional recognition he was and should be always most profoundly grateful. For all the kind things the president had said of him, or so much of them as he was entitled to, he was most sincerely thankful, and he could only hope that he might yet be spared awhile to assist in the useful work that lay ahead, the accomplishment of which should maintain the institution in the forefront of the technical societies of the kingdom. It was difficult for him to find words to express his earnest thanks and his gratefulness for the beautiful gifts they had presented him with that day. It was certainly a most delightful idea to associate his daughter with him in that charming presentation. She would, he well knew, treasure all her life that very beautiful memento, and on her behalf he tendered them her most sincere and heartfelt thanks and deepest gratitude. He could only say, "Thank you; thank you from the bottom of my heart," and that for the rest of his days he would look upon these gifts as the very precious testimony of their kind and most generous appreciation of his life's work.

Sanitation in the Hexham Rural District.—The county medical officer's report on sanitary matters came before the meeting of the Hexham Rural District Council. With regard to sewerage and sewage disposal, it was stated that, although many improvements had been effected in recent years, the rural district council were under many obligations which had not hitherto been met. The much-discussed schemes for North and South Wylam, Corbridge, Acomb and Allendale were still "on paper" only, and unless some early and definite steps were taken in the direction of fulfilling the council's obligations at these places, more drastic measures under the Rivers Pollution Acts would be necessary.

London County Council School Buildings.—Under a scheme initiated by the London County Council in agreement with the Board of Education for the reduction of the maximum accommodation of classrooms to forty in senior and forty-eight in infants' departments, it is proposed to provide sufficient new school accommodation to allow of the reduction of the accommodation of all classrooms to the new maxima within fifteen years from March 31, 1912. During this period the council propose to provide about 24,000 school places in each triennium, and to proceed with the modernising of the structures of old council schools. It is estimated that it will be necessary to provide during the fifteen years' period about 120,000 school places, inclusive of the accommodation required to meet increases of population and for other purposes. The total expenditure involved in the purchase of sites, the erection of new buildings, and the improvement of the structures of existing buildings, is estimated at £5,150,000. The progress made up to December, 1913, in the initiation of school provision in connection with the scheme is shown in the annual report of the council dealing with education, just published [price 2s. 6d.].

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

456. Strength of Materials. A rectangular beam is loaded by a weight at its centre. How will the deflection be changed by (*a*) doubling the span, (*b*) doubling the width, (*c*) doubling the depth, (*d*) doubling the load?

457. Hydraulics. A common formula for the mean velocity of flow in streams and artificial channels is $v = c\sqrt{mi}$. Explain carefully the meanings of the various factors on the right-hand side of the expression, and state how the values of *c* for various kinds of channels have been determined.

458. Fireproof Construction.—Give sketches of some good forms of fire-resisting floor construction for a warehouse.

459. Sewage Sprinkler.—Describe an efficient form of sewage sprinkler for percolating filters which requires very little head of sewage to work it. (J. R. H., *Ipswich.*)

460. Sewage Sea Outfall.—Are reinforced-concrete pipes better than cast-iron pipes for a sewage outfall into the sea, which is covered at high water? Compare them as regards initial expense and maintenance. (J. R. H., *Ipswich.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

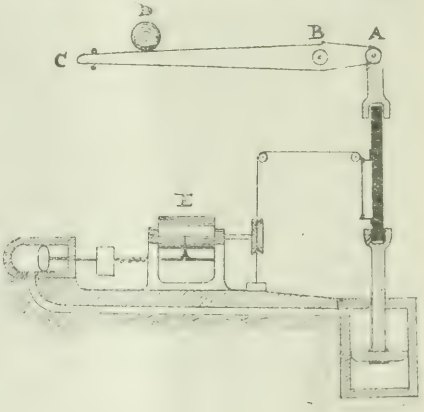
454. Foundations.—What should be the composition of concrete for the foundations of a factory chimney stack? Would lime concrete be suitable? (Ajax.)

The nature of the foundation for a chimney depends on the stability of the chimney site. Generally speaking, the foundation should be composed of Portland cement concrete in the proportion of 4 parts of stone (broken to pass a 2-in. ring, and retained on a ½-in. ring), 2 parts of clean sharp pit sand, and 1 part of Portland cement of standard quality. In cases where bad ground is met with the concrete should be reinforced, and, if necessary, placed on a raft. If the ground is exceptionally bad, reinforced-concrete piles should be driven, and the concrete foundation laid on top of and bonded into them. Lime concrete is very inferior to Portland cement concrete for work of this class. (J. R. H., *Ipswich.*)

For the construction of the foundation for a factory chimney, it would not be advisable to use lime concrete. In the event of lime being used, it should be hydraulic—such as blue lias lime—and should be allowed to set at least two months before the superstructure is commenced. For this class of work cement concrete is far superior, and after being allowed to set for two weeks the building could be safely started. The composition of the cement concrete should be 5 of broken brick or stone, and 1 of fine gravel to 1 of cement. It should be laid in beds not more than 18 in. in thickness, and care should be taken in tipping it into the trenches. If the trench be deep, a shoot should be used so as to prevent disintegration of the mixture. (F. J. M., *Luton.*)

455. Testing Materials.—Give an outline sketch of a testing machine for tension tests of steel. (Inquirer.)

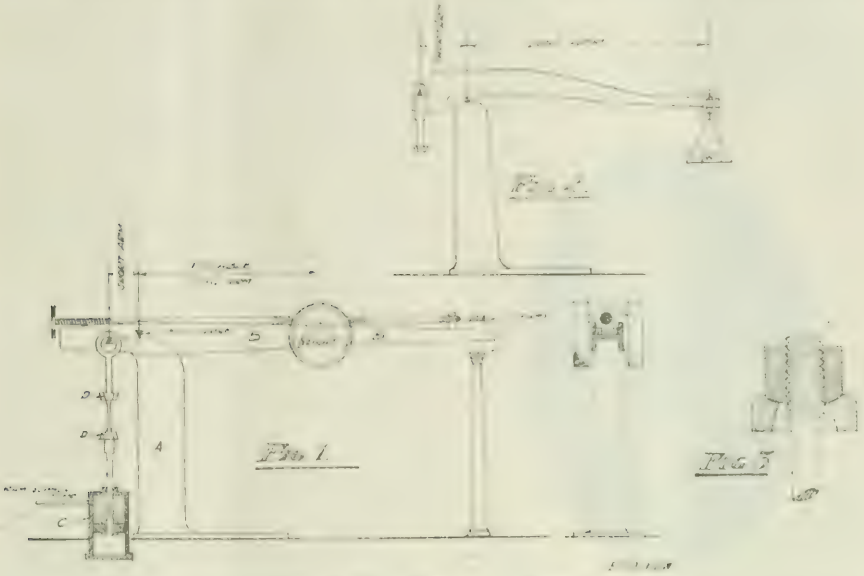
The tenacity of a metal is the [illegible] it offers to the separation of its molecules by force. The tenacity of various metals varies considerably according to their physical properties, but in all cases the tensile strength becomes reduced by a rise in temperature. The tensile strength of metals is determined on a straight bar 1 in. square, the strength being expressed per square inch according to the number of tons or pounds required to produce a rupture of the test bar. When the test bar is submitted to a tensile test, it is increased in length proportional to the weight applied until a certain limit is reached; then the strain increases very rapidly, and a permanent distortion is produced. The point at which this extra strain commences is known as the "elastic limit" of the metal, which is "the greatest strain that does not produce a permanent set in the material." If this limit is exceeded the structure rapidly fails. A machine for testing metals is shown in sketch. It is made with two pairs of jaws in which the test bar is held. One pair are connected with a hydraulic cylinder,



and the other pair with a lever carrying a weight, by which the stress exerted by the ram is measured. A simple lever carries a balance which measures the load, the pressure being applied by hydraulic ram. The ratio of AB to BC is 50 to 1, so that at C it balances 50 tons at A, the weight being 1 ton. E is a revolving drum worked by a wire attached to the test bar. The pencil is worked by pressure in hydraulic press, and has an axial motion proportional to stress, by which a stress diagram is obtained. The safe working load for mild steel is 6 tons per square inch in compression and tension, and the ultimate strength is 30 tons per square inch in compression and tension. (Sanitas.)

The chief features of any machine for efficiently testing the tensile strength of steel are: (1) That the machine should be sufficiently sensitive to record tests that will be more severe than the actual stress the material will have to withstand; (2) the method of applying the load must be as easy as possible, and no undue shocks must be given at each increase of load. In the earlier machines (Fig. 2) a long fixed arm formed the lever, and the stress was applied by variable loads (W) at its extreme end. This method was both laborious and inaccurate, as shocks were given at each increase of load. Fig. 1 shows an outline of the essential parts of a 50-ton Buckton testing machine. A is a rigid casting securely bolted to the foundations, and carrying the principal knife-edge or fulcrum of the lever B, to which is attached the jockey-weight. At the base of the standard is a hydraulic press (C) fed by a hydraulic ram, which takes up the deformation of the specimen, which is held between the shackles DD (details of which are shown by Fig. 3). The object of the press (C) is to take up the elongation

of the bar, thus keeping the lever in balance that is floating freely between the stops which limit its motion. The pocket weight is exactly 1 ton, and can be moved along either by hand or by rotating A vernier is attached to the pocket weight, which is set at zero on a scale running along the lever. The pocket weight is moved along the lever and sets 1 ton to the load for every 3 in. of movement, and the vernier reads on the scale to 1/100 ton, the press meanwhile keeping the lever horizontal. The Admiralty tests for steel tensile and extension tests are strips cut lengthwise or cross-



50-ton Buckton Testing Machine.

wise on the plate to give an ultimate tensile strength of not less than 26 tons per square inch, 30 tons per square inch of section with an elongation of 20 per cent in a length of 8 in. (E. J. M.)

WORKING-CLASS ACCOMMODATION IN LONDON.

With a view to the county council being kept informed as to the provision of working-class accommodation in London and the adjoining districts, a return is prepared each year showing the amount of new accommodation provided and old accommodation destroyed. The return which has been prepared for the years 1902 to 1912 inclusive, gives the number of working-class tenements and rooms provided in each borough or district, and the rents at which they are let or to be let, in addition to particulars of the demolitions which have taken place in each district during the year. The return for 1912, it is noted in Part III. of the annual report of the county council for 1913, shows that, for the first time since this record was taken, there has been a nett reduction for the year in the amount of working-class accommodation in the county, the number of rooms demolished (6,790) having exceeded the number provided (4,167) by 2,623. In extra-London—i.e., the area known as Greater London exclusive of the county of London—the number of rooms provided was 13,141, and the number demolished 807, or a nett addition of 12,334.

The average weekly rents at which the new dwellings were let, or to be let, were, during 1912, 3s. 5½d. a room in the central districts of London, 2s. 7d. in the outer districts of London, and 2s. 4½d. in the extra-London districts.

Institution of Mechanical Engineers.—The annual general meeting of this body will be held on Friday next, the 19th inst., when a paper on "Convertible Combustion Engines" will be read by Mr. Alan E. L. Chorlton, member. The chair will be taken at 8 o'clock.

LONDON MAIN DRAINAGE.

WORK AT BARKING AND CROSSNESS OUTFALLS.

Volume III. of the annual report of the London County Council has just been issued, and includes some interesting particulars with regard to the main drainage of the administrative county.

A table in the report shows the quantity of sewage treated, chemicals used in precipitation,

Sewage treated, 58,306,918,286 gallons and 45,733,395,400 gallons—a total of 104,040,313,686 gallons.

Sewage daily average, 159,744,981 gallons and [illegible] gallons.

Lime used, 13,343 tons and 9,775 tons—total, 23,118 tons.

Proto-sulphate of iron used, 3,075 tons and 2,794 tons total, 5,869 tons.

Sludge sent to sea, 1,683,000 tons and 946,000 tons—total, 2,629,000 tons.

[illegible] 32,400 tons and 18,192 tons—total 50,558 tons.

Refuse intercepted at gratings, 3,938 tons and 1,450 tons—total, 5,388 tons.

From the above figures it will be seen that at Barking outfall 1 ton of sludge was extracted from an average of 34,645 gallons of sewage treated—or slightly less than in the previous year. At Crossness outfall the average quantity of sewage treated to produce 1 ton of sludge was 48,344 gallons, which is also less than in the preceding year. The total quantity of sewage treated is shown as about 7·4 per cent less than in the preceding year. The quantity of sludge sent to sea was 1·4 per cent more than in 1912.

Nottingham Port Scheme.—Although there was slight opposition, the Nottingham Corporation have decided to proceed with the Bill for improving the Trent navigation and making Nottingham an inland port. The estimated cost of the scheme is £160,000.

London County Council Tramways Bill.—The London County Council Tramways and Improvements Bill came before the Examiners of Standing Order Proofs at the House of Commons recently, and was stopped, owing to representation of non-compliance with standing orders. The Bill will, therefore, have to come before the Standing Orders Committee, which, unless it sees fit to suspend the standing orders will have to reject it this Session.

NOTTS COUNTY SURVEYOR.

COUNTRY OR COUNTY?

Mr. E. Purnell Hooley, M.INST.C.E., the county surveyor of Notts, whose resignation of that office after twenty-five years' service (*i.e.*, the whole period during which Notts has possessed either a county council or a county surveyor) we had to chronicle recently, was for many years an officer in the reserve forces, holding a commission as Captain in the Robin Hood Rifles.

Upon the outbreak of the present war it was almost a foregone conclusion among those who know him intimately that his high sense of patriotic duty and keen military ardour would impel him to offer his services to his country, and it was not long before we found him gazetted Captain in the Sherwood Foresters—otherwise the 8th Battalion of the Nottinghamshire and Derbyshire Regiment. Here his

CAPTAIN QUARTERMASTER HOOLEY.

well-known organising ability was quickly recognised, and he undertook the onerous duties of Captain Quartermaster to the battalion. By the fortunate circumstance that the battalion's headquarters and training centre are in the vicinity of Nottingham he has, with the loyal aid and ever-ready co-operation of his staff, been enabled to continue to perform his official duties. The training of the battalion is, however, approaching completion, and it is under orders to proceed to a more distant station preparatory to going to the Front.

In this contingency, and with the desire that, upon Captain Hooley's return to civil life, the council should continue to have the advantage of his unique experience, a suggestion was made that the work of his department should, for the time being, be entrusted to the present staff, outside advice being called in when deemed necessary—or, alternatively, that a *locum tenens* should be appointed; but, with an inconsistency that is not a little surprising, prominent members of the council who at recruiting meetings had been especially conspicuous in exhorting men to make great sacrifices in their country's cause seemed in this instance to act upon the view that the officials of the council were on a plane that precluded them from responding to their country's call, the convenience of the council being of even more moment than the nation's vital need.

In passing we can hardly refrain from observing that when men elected to high positions in the public service act in this way it is not to be wondered at that the Government find it necessary to advertise special appeals to employers to give facilities to their employees to enlist.

As a result Mr. Hooley tendered his resignation, personal considerations and advantages being evidently in his view altogether outweighed by his obligations to his country; at the same time he acknowledged that he was deeply sensible of the kindly feelings evinced towards him and so warmly expressed by the chairman of the Highways Committee, Colonel Denison, C.B., under whom he has served for very many years, and by Mr. Chas. Mason, J.P., who will be remembered by many of our readers as the surveyor to the late Metropolitan Vestry of St. Martin-in-the-Fields.

What will be the county of Nottingham's loss will certainly be a gain to the country.

At the moment our sincere hope is that good fortune may attend Mr. Hooley throughout the period of his military service, and that he will retire therefrom in the enjoyment of the best of health, with the lustre of new honours to add to those he has so deservedly gained in his profession. We believe that upon his return to civil life he purposes establishing himself at Westminster as a consulting engineer, when his pre-eminent expert experience and high reputation in the special branch of the profession he adorns should certainly ensure him success. He has our most cordial wishes.

Captain Hooley's eldest son, George, is also a Captain in the Sherwood Foresters. He was trained as a pupil and assistant to his father, but (as is recalled by the *Nottingham Guardian*) as a result of the visit of the latter to the American Good Roads Congress held at Seattle in 1909—at which Mr. Hooley's presence and paper on "Tar and its Uses in Road Construction" were prominent features—some of the leading spirits in the "Good Roads" movement in the United States induced Mr. George Hooley to make his home in that country, so that it might reap practical benefit from the employment of methods propounded by Mr. Purnell Hooley, and the experience gained by his son in being associated with him in this work.

After some five years' service in the States Mr. Geo. Hooley recently returned to this country, and, inheriting the martial spirit of his father, at the outbreak of the war at once offered himself for active service.

Another member of Mr. Hooley's family—his brother-in-law, Dr. Stallard, ex-mayor of Newark—is medical officer of the same battalion, while another brother-in-law is Major Sidney Stallard, the county surveyor of Oxfordshire, who, it will be remembered, served in the South African Campaign, gaining special distinction by fighting a successful rearguard action against De Wet—a unique experience at that time—for which he was very warmly eulogised in a special article by the late Mr. Bennet Burleigh, the well-known war correspondent of the *Daily Telegraph*. Major Stallard served as an officer in the 17th County of London Battalion, of which Mr. W. B. Bryan, M.INST.C.E., chief engineer to the Metropolitan Water Board—whose death we had occasion to lament recently—was Colonel.

It came with something of a shock to us, when reading the report of the meeting of the Notts County Council at which the arrangements following upon Mr. Hooley's resignation were decided upon, not to find any mention of the granting of a suitable retiring allowance to one whose able and untiring service as their county surveyor for a quarter of a century surely deserves substantial recognition. We therefore trust we are not mistaken in believing that in due course this question will be dealt with in a just and even generous spirit, such, for instance, as actuated the London County Council in granting Sir Laurence Gomme, their clerk, a retiring allowance of £1,000 per annum, with, in addition, a douceur of £3,346.

ROTHERHAM BOROUGH SURVEYORSHIP.

THE SUCCESSFUL CANDIDATE.

Mr. W. Shackleton, ASSOC.M.INST.C.E., borough surveyor of Nelson, was on Wednesday appointed borough surveyor of Rotherham, in succession to Mr. E. B. Martin, M.INST.C.E., the new borough engineer of Salford.

Athlone Waterworks. The Local Government Board have refused sanction to a loan of £4,000 asked by the Athlone Urban District Council to extend and improve the waterworks plant in view of an increased demand for supplies. Recently the military authorities became customers of the council, and will take annually 7,000,000 gallons of water.

Novel Wood Curing. A French process of "electro-curing" timber is stated to give perfect seasoning in a single night, and at little cost. With lead-plate electrodes on each side, the timber is placed in a solution containing 10 per cent of borax, 5 per cent of resin, and a little soda; application of the current expels the sap and fills the wood cells with the borax and resin.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible

INQUIRIES HELD.

Leeds T.C. (February 5th. Mr. R. G. Hetherington). £1,600 for the provision of a pumping station for sewage at Shadwell.—The station is required in order to deal with the sewage of a portion of Shadwell, which lies outside the watershed of the river Aire, and the proposal is to run a rising main from the pumping station to the crest of the hill, whence the sewage will be gravitated into the Leeds sewers. This proposal marks the completion of the scheme of sewerage for Shadwell. The inspector afterwards held an inquiry into a further application of the corporation for sanction to borrow the sum of £1,200 for the provision of a new boiler-house at the Cookridge-street baths, and for sanction to borrow the sums of £100 and £150 respectively for the erection of a dressing-room for children in connection with the Kirkstall-road and Dewsbury-road baths.—The case on behalf of the corporation was submitted by Mr. Thomas Thornton, deputy town clerk, and Mr. W. T. Lancashire, city engineer.

Loughborough T.C. (February 8th. Mr. R. H. Bicknell). £5,500 for building a fire engine station and depot.—It was stated that the estimated cost of the fire engine station was £2,012, and that a larger depot was necessary, the present premises being quite inadequate for storage purposes.

Manchester T.C. (February 10th. Mr. P. M. Crosthwaite).—£60,000 for works of sewerage, and £1,775 for the purchase of property in the township of Flixton adjoining the Davyhulme sewage disposal works.—The deputy town clerk, Mr. P. M. Heath, submitted the case for the city council. No opposition was offered to the borrowing of the £60,000, but the proposed purchase of property in Flixton was resisted by certain property owners in the neighbourhood. As regards the sewerage scheme, the city surveyor, Mr. T. de Courcy Meade, stated that the money was needed for new sewers at East Didsbury, Parrswood, Mauldeth-road to Moseley-road, and for the drainage of Millgate-lane and Stenner-lane.

Newton Abbot R.D.C. (February 9th. Mr. W. O. E. Meade-King).—£3,100 for an additional water supply for Bovey Tracey.—Mr. S. C. Chapman, water engineer to the Torquay Town Council and engineer for the scheme, said the population to be supplied was 2,300, and provision was being made for supplying 3,000. The idea in obtaining additional water from Yarner was to supplement the existing supply, and to allow of water being carried to a higher point than could be done at present. It was proposed to take the additional water direct into the existing main, and if the supply became inadequate through the erection of additional houses it could be easily supplemented by a reservoir.

Sheffield T.C. (February 4th. Mr. M. K. North). £10,000 for the purchase and laying out of land at Tinsley Park Wood as a municipal golf course.—The town clerk said the city council had opened a course at Woodseats, and in eight months they had sold 30,847 tickets, at 3d. each, which had brought them in over £385. Sir William Clegg, on behalf of the city council, said that the idea of having golf courses in public parks had been considered, but it was considered too dangerous. A nine-hole course at Abbey Lane had been very popular, in spite of it being indifferent and difficult of access. They thought they would be able to pay their way with the present scheme.—£6,365 for the erection of a chapel (to seat 150), an entrance lodge, and a registrar's residence and offices, in connection with the proposed new cemetery at Abbey-lane.—An inquiry was also held into a proposal to borrow £350 for additional bowling greens at Abbeyfield Park and Bole Hills recreation ground.

Warrington T.C. (February 4th. Mr. F. O. Stanford.—This was an inquiry into an application in connection with a scheme for widening and improving the Market-gate and Sankey-street, Warrington.—This is part of a scheme for the improvement of the centre of the town, and will involve the demolition of two hotels, the Blackburne Arms and the Pelican, the Market Hall, erected in 1855, and large business premises. A portion of the improvement has already been carried out. Mr. A. T. Hallaway, deputy town clerk, said it was the intention of the corporation to make provision as far as possible for the reinstatement of owners and tenants affected by the scheme.

APPLICATIONS FOR LOANS.

Bournemouth T.C.—£3,400 for the erection of public conveniences.

Burnley T.C.—£30,942 for the erection of two schools.

Darlington T.C.—£2,650 for school extension, and £18,500 for the extension of the electricity works.

Durham T.C.—£850 for road and other improvements.

Exeter T.C.—£7,724 for the extension of the waterworks.

Farnham U.D.C. £4,250 for drainage schemes.

Hastings T.C. £1,025 for the provision of a rate office.

Holywood U.D.C. £5,500 for a water supply scheme.

Kirkby U.D.C.—£2,190 for waterworks extensions.

Nelson T.C.—£3,000 for water mains.

Newport (Mon.) T.C. £11,820 for a drainage scheme.

Pontefract T.C.—£2,250 for public baths, and £2,500 for street improvements.

Wakefield T.C.—£4,000 for electricity mains, transformers and sub-stations.

LOANS SANCTIONED.

Axminster R.D.C. £1,515 for works of water supply.

Barking U.D.C.—£3,519 for the second portion of the St. Paul's-road scheme.

Barrow-in-Furness T.C.—£375 for a road improvement.

Batley T.C. £3,150 for street improvements.

Bournemouth T.C.—£7,800 for wood paving works.

Cheriton U.D.C. £2,000 for a street improvement.

Croydon T.C. £3,000 for sewage works extensions.

Doncaster R.D.C.—£1,150 for the erection of workmen's dwellings.

Horbury U.D.C.—£4,161 for a public hall and offices.

Leek U.D.C.—£1,030 for the purchase of land for extension of gasworks; £2,455 for the construction of new streets; £314 for the purchase of land for allotment purposes; and £3,660 for the laying out of Brough Park.

Nottingham T.C.—£34,536 for the Carter Gate improvement.

Porthcawl U.D.C.—£8,000 for laying an additional water main.

Reading T.C.—£14,500 for the extension of the sewage disposal works.

Wakefield T.C.—£1,300 for the purchase of land for hospital extension.

Wrexham R.D.C.—£11,000 for workmen's houses.

FORTHCOMING INQUIRIES.

	FEBRUARY.	£
15.—	**Brighton.** For the provision of public conveniences (Mr. R. H. Bicknell)	1,880

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Cambridge, East Riding, Finchley, Plymouth; housing and town planning—Chester-le-Street; roads and materials—East Sussex, Herts, Marylebone, Paddington; sewerage and sewage disposal—Doncaster, Penarth; water, gas and electricity—Exeter, Oswestry.—Particulars of other projected works will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Aldershot U.D.C.—The plan and estimate of the surveyor, Mr. F. C. Uren, for the erection of a public convenience in the Municipal Gardens has been approved.

Bournemouth T.C.—The borough engineer, Mr. F. W. Lacey, has received instructions to prepare plans of two new groynes, each about 200 ft. long, at an estimated cost of £2,000.

Brierley Hill U.D.C.—The council have approved the plan of the surveyor, Mr. J. L. Harpur, for an additional public convenience.

Cambridge T.C.—The Local Government Board have sanctioned the scheme for the extension of the Guildhall and the free library buildings, and granted the loan for the works.

East Ham T.C.—An extension of the office accommodation at the electricity generating station is to be effected, at an estimated cost of £300.

East Molesey U.D.C.—The Highway Committee recommend the erection of a new bridge for vehicular traffic over the water-splash in Summer-road. The present primitive ford is certainly one of two anachronisms in the road—the other being a railway level crossing.

East Riding C.C.—It is announced that the Local Government Board have approved the scheme for the provision of an isolation hospital at Great Driffield, at an estimated cost of £13,275.

East Sussex C.C.—The council on Tuesday last authorised the Roads and Bridges Committee to expend a sum not exceeding £5,000 upon sea-defence works.—The council approved a report by the county surveyor, Mr. F. J. Wood, recommending certain repairs and renovations at the county hall, Lewes.

Exeter T.C.—By direction of the Board of Education the plans of the proposed new school have been revised by adding a mechanical laboratory, at an extra cost of £742. The total estimated cost of the building is £3,142.

Finchley U.D.C.—A decision has been reached to erect a hospital for Finchley and Hendon patients, at an estimated cost of £50,000.

Lincoln T.C.—Public baths are to be provided at the East End at an estimated cost of £400.

Perth T.C.—The council are advised to carry out extensions at the electricity works, at an estimated cost of £4,000.

Plymouth T.C.—The council have approved the proposed extension of the borough lunatic asylum at Blackadon to accommodate 440 additional patients, and Messrs. Thornely, Rooke & Barron, architects, have been instructed to prepare plans. The cost of the extension is estimated by the borough treasurer at £100,000.

Salford T.C.—Amended plans of the proposed sanatorium at Marple have been forwarded to the Local Government Board. The estimated cost shows a reduction of upwards of £5,000.

Shropshire C.C.—The tender of Messrs. Hobrough, Gloucester, at £1,421, has been accepted for widening and improving Ercall Mill Bridge.

Southgate U.D.C.—It has been agreed to erect a public convenience at the Triangle, at an estimated cost of £1,800.

West Sussex C.C.—Mr. Howard Humphreys, as consulting engineer, has reported upon the condition of Norfolk Bridge—a structure of the suspension type—and as a result the council have resolved to make an order closing the bridge to all vehicles which, together with their load, exceed over 2 tons in weight. The question of strengthening the bridge is to be considered.

HOUSING AND TOWN PLANNING.

Chester-le-Street U.D.C.—In regard to the scheme for the provision of 196 houses, the council have accepted the tender of Mr. John Douglass, Newcastle-on-Tyne, at £10,360, for building the first fifty.

Settle R.D.C.—Four housing schemes have been prepared, and have been submitted to the several parishes concerned for their consideration.

Teddington U.D.C.—It was on Monday decided to inform the Local Government Board that the council are not at present disposed to proceed with a town planning scheme.

PARKS AND OPEN SPACES.

Blackpool T.C.—The borough surveyor, Mr. J. S. Brodie, has received instructions to obtain tenders for laying out a new recreation ground and bowling green at Highfield-road, South Shore.

ROADS AND MATERIALS.

Aldershot U.D.C.—It has been agreed to purchase a steam motor wagon from Fodens, Limited, estimated to cost £600, as per the following specification: 5-ton standard wagon, combination water cart (1,000-gallon tank), and tipping wagon. If the sanction for two is received, a second motor wagon can be purchased at a later date if deemed advisable.

Bristol T.C.—The consulting engineer, Mr. T. H. Yabbicom, has arranged terms for the purchase of 2,678 super. yds. of land in Parry's-lane for the purpose of an improvement. The total cost, including the re-erection of the boundary, is £902.

Darlington R.D.C.—A scheme for the improvement of Lingfield-lane, at an estimated cost of £2,300, is under consideration.

Carmarthenshire C.C.—In reply to applications made for grants in respect of the cost of road improvements, the Road Board wrote they could not depart from their decision to refuse the grant to Tro'rderlwyn, Brynamman, because the work was commenced prior to an application being made for a grant. As to other schemes, they would consider the applications when the necessity of providing employment arose, for so far they had no advice from the Local Government Board of unemployment in any part of Carmarthenshire. The council appointed a deputation to interview the Road Board on the subject.

East Ham T.C.—A letter having been received from the Road Board intimating that they could only consider a grant towards the cost of resurfacing various main roads in the event of considerable unemployment prevailing in the borough, the borough engineer, Mr. J. E. W. Birch, and the borough treasurer have been appointed to approach the board again on the subject.

East Sussex C.C.—The council on Tuesday last adopted a report by the Roads and Bridges Committee stating that the committee had had before them a report by Mr. Anthony A. I. Pelham, chief assistant to the county surveyor, dealing with the economy of tarred roads, compared with untarred roads; and on his recommendation the committee decided to ask the council to authorise the county surveyor to purchase twenty-five small tar boilers at a cost not exceeding £150. They also recommended that where the surfaces of main roads are being tarred, the tarring shall, if necessary, include the portions of such roads which it is proposed to break up in the following season.—The council authorised the Roads and Bridges Committee to expend a sum not exceeding £31,000 on the supply and haulage of road material for the year ending 31st March, 1916.

Egham U.D.C.—The council have approved the proposals of the county council to improve the dangerous corners at the Glanty (at an estimated cost, for road only, of £207) and at Shrubbs Hill (at an estimated cost, for road only, of £112).

Finsbury B.C.—It is proposed to widen Jerusalem-passage at an estimated cost of £550, and application

[illegible] been made to the London County Council for [illegible] consideration in and of the work.

Gainsborough R.D.C. The estimate of the surveyor, Mr. R. Maxwell, amounting to £9,462 for highway maintenance for the ensuing year, has been approved. It was stated that £2,400 was for wages, and that there was no increase in the estimate. Mr. Maxwell said he was glad to state that it was not necessary to increase the costs of the roads, notwithstanding that the traffic was very much heavier than in former years. He attributed the preservation to the policy of the council in being among the first authorities to adopt tarred rolling and to utilise the best material.

Haddington C.C.—The Western District Committee have resolved upon a road improvement scheme at Seton, the estimated cost of which is £3,000.

Henley T.C.—The borough surveyor, Mr. C. F. A. Pratt, has been instructed to give special attention to the sanding of the [illegible] road in the event of frost, and to [illegible] for the purpose.

Herts C.C.—A comprehensive scheme of road improvement, estimated to cost £140,449 has been adopted. The Road Board have made a grant of half the cost of the work.

Hull T.C.—A scheme for the improvement of Holderness-road is progressing, land to the value of £850 having been purchased for the purpose.

Lanarkshire C.C.—It has been resolved to promote a petition opposing the Caledonian Railway Provisional Order, 1915, in order to raise the question of the proposed [illegible] for the running of motor omnibuses.

Maesteg U.D.C.—The surveyor, Mr. J. Harpur, has been authorised to carry out improvements at four roads.

Marylebone B.C.—It has been decided to carry out works of [illegible] at an estimated cost of £9,163.

Middlesex C.C.—An estimate of £4,000 has been passed in connection with the acquisition of the land for the Great West Road.

Paddington B.C.—It has been resolved to proceed with wood paving renewals, at an estimated cost of £12,500.

Poole T.C.—Plans are being prepared for the widening of Fernside-road.

Shropshire C.C.—In order to provide employment consequent on the closing down of certain plant of the Lilleshall Company, it has been agreed to strengthen the Priorslee and Burlington road, at a cost of £2,860, and the Wellington and Newport road, at a cost of £2,730. Half the cost in each instance will be met by the Road Board, who will also advance, free of interest, the remainder of the cost, repayable by five annual instalments.

Sunbury U.D.C.—The Road Board have agreed to grant £922 towards the proposed [illegible] of Staines-road with Tarmac.

Uckfield U.D.C.—The council have approved the draft specification and plans of the proposed reconstruction of Ridgwood Hill, and tenders are being invited for the work.

Winchester R.D.C.—Improvements are to be carried out on roads in the vicinity of the military camps, at an estimated cost of £3,134, which will be met by the War Office and the Road Board.

SEWERAGE AND SEWAGE DISPOSAL.

Bradford T.C.—There have been negotiations for some time between the corporation and the Guiseley Urban District Council as to the disposal of the Guiseley sewage. Recently the Bradford Sewage Committee passed a resolution that an agreement be drawn up by the town clerk (Mr. Frederick Stevens) to treat the sewage of Guiseley for a period of thirty years, subject to the payment by the urban council of a sum equal to 1s. 2d. in the £ of the rateable value of the district, and of £95 received from the Yeadon Urban District Council for the treatment of sewage. The corporation are to take over all the council's freehold land and buildings now used for sewage disposal purposes, and loans not exceeding a total of £4,750.

Doncaster T.C.—It has been resolved to make the proposed scheme of sewage disposal the subject of competition, with prizes of £300, £200 and £100 for the three best designs.

East Ham T.C.—A letter has been received from the Local Government Board stating that they were prepared to sanction the council's application to borrow £4,028 and £3,359 for the provision of additional tanks and contact beds at the sewage disposal works.

Maidstone R.D.C.—The surveyor, Mr. W. T. A. Busbridge, has been instructed to prepare a scheme of sewerage for the Marden district.

Morley T.C.—Sewerage works are to be carried out in Albert-road, at an estimated cost of £1,600.

Oswestry R.D.C.—The sewerage scheme for Ifton Heath, prepared by Messrs. Berrington, has been referred to the parish council for their consideration.

Penarth U.D.C.—A sewage disposal scheme for the western part of the town is to be carried out, at an estimated cost of £15,000.

Teddington U.D.C.—At Monday's meeting it was decided to accept the tender of Mr. J. T. Moran—who is already the contractor for the first half of the sewerage extension scheme—for the remaining work, at £22,298. The proposed arrangement with Mr. Fairley, the engineer to the scheme (referred to in THE SURVEYOR of January 22nd) will not be proceeded with.

Uxbridge R.D.C.—The surveyor, Mr. J. W. Harrison, has been asked to include details of the ejector system in submitting a report on the Hare-[illegible] drainage [illegible].

WATER, GAS, AND ELECTRICITY.

Exeter T.C.—[illegible] has approved a [illegible] scheme for the development and extension of the waterworks at Pynes, at an estimated cost of £7,700.

Leeds T.C.—The [illegible] has passed a resolution directing the Gas and Tramways and Electricity Committees [illegible] sub-committee whose duties shall be to consider and report to the full committee from time to time on all questions relating to the [illegible] to consumers, with a view of preventing and avoiding overlapping and competition in the sale of [illegible].

Oswestry R.D.C.—The Local Government Board have sanctioned a scheme for the extension of the Western Rhyn waterworks.

Plympton R.D.C.—A new water [illegible] has been provided for a [illegible] at an estimated cost of £877.

St. Just R.D.C.—The water engineer, Mr. F. C. Uren, in a report, recommends the council to adopt a [illegible] supply from the Geevor [illegible]. The estimated cost of the project is £6,640.

Teddington U.D.C.—It has been decided to adopt the automatic system of lighting and extinguishing the public lanterns, the council undertaking the [illegible] and future [illegible] of the [illegible].

Warrington T.C.—It has been agreed to carry out a scheme for safeguarding the domestic water supply by drawing and filtering river Mersey water for manufacturing purposes.

Windsor T.C.—The borough surveyor, Mr. E. A. Stickland, has been instructed to prepare plans of foundations for five Dedor filters which the council propose to instal.

MISCELLANEOUS.

Edinburgh T.C.—The Streets and Buildings Committee have agreed to recommend an increase of 1s. a week to paviors and labourers in the roads department, which would add £91 to the yearly pay bill. They also agreed to recommend that the wages of the temporary men in the drainage department engaged in reconstructing the sewers, should be increased from 27s. 6d. to 30s., and that they should be put on the same footing as the permanent men.

Lowestoft T.C.—The borough surveyor, Mr. G. H. Hamby, has completed his survey of the groynes on the north and south beaches, and has submitted plans showing their present condition and the renewals necessary. His estimates of the cost of the renewals are as follows: For the north beach £4,885, and for the south beach £7,880, making a total of £12,765. The matter is to be considered by the Sea Defence Committee.

Yarmouth T.C.—The council have approved a plan submitted by the Town Planning Committee for the widening and diversion of certain roads; the provision of additional roads; the restriction of the num-

ber of buildings to the acre; the use of certain land for manufacturing and trade purposes: the provision of public and private open spaces; and the setting apart of ground for the extension of Gorleston cemetery. An instruction was given for the portion of Lowestoft-road within the area to be widened to 100 ft.

PERSONAL.

Mr. H. G. Warne has been appointed surveyor and inspector to the Kingswood Urban District Council.

Mr. Adam Simpson, assistant burgh surveyor of Kilmarnock, has been appointed burgh surveyor and water engineer of Troon.

Mr. Bertram C. Hammond, Shirehall, Worcester, has been elected an associate member of the Institution of Civil Engineers.

Mr. J. N. Stirling, burgh surveyor of Helensburgh, has received the appointment of sanitary inspector held by the late Mr. John Mowatt.

Mr. J. W. Stevens, surveyor and inspector to the North Walsham Urban District Council, has been granted an increase of salary of £20 a year.

Mr. J. A. Phillips, St. Mabyn, Cornwall, was on Wednesday appointed surveyor to the Newton Abbot Rural District Council in succession to Mr. W. Olver.

Mr. W. J. Cutbill, chairman of Claridge's Patent Asphalt Company, Limited, 3 Central Buildings, Westminster, S.W., died, we regret to state, on the 27th ult.

Mr. Michael Moyniham, a member of the borough surveyor's staff, was on Monday appointed deputy borough surveyor of Dublin. The appointment of deputy had been in abeyance for a number of years.

Mr. George Calvert, road surveyor of No. 1 District, County of Aberdeen, has been appointed by the Haddington Western District Committee road surveyor for the area in succession to the late Mr. Thomas Callen.

Mr. James Wallace, who had been surveyor to Panteg Urban District Council for twenty years, and was previously surveyor to Llanffrechfa Upper Urban District Council, passed away at Griffithstown on Wednesday.

Mr. T. A. Peace was on Tuesday last appointed docks engineer of Bristol, at a salary of £1,000 a year, rising to £1,200, in succession to the late Mr. W. W. Squire. Mr. Peace was a member of the docks engineering staff.

FOR OTHER ADVERTISEMENTS
See End of Paper.

RURAL DISTRICT OF WILLITON.
ASSISTANT HIGHWAY SURVEYOR.

The Williton Rural District Council invite applications for the post of Assistant Highway Surveyor for their District at a commencing salary of £90 per annum.

The person appointed will be required to work under the direction of the District Surveyor, and he must provide a motor bicycle for his own use.

Further particulars can be obtained on application to the undersigned.

Applications, stating age and qualifications, accompanied by copies of not more than three recent testimonials, must be received by me not later than noon on 22nd February, 1915.

FRANK RISDON,
Clerk.

Williton, Taunton.
February 10, 1915. (2,361)

ROMFORD RURAL DISTRICT COUNCIL.
Assistant required for the duration of the War. Must be a good surveyor, leveller and draughtsman, and accustomed to superintending building, sewerage, and street works.

Salary £120 per annum.

Preference will be given to applicants ineligible for military service.

Apply with full particulars and copies of testimonials to

W. J. GRANT.
Surveyor.

16A South-street.
Romford, Essex. (2,358)

A MUNICIPAL ENGINEER in Lancashire requires an experienced Temporary Engineering Assistant. Salary £3 per week. State age and qualifications, with copies of three recent testimonials, to Box 1,505, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,357)

THE SURVEYOR to a Rural District Council in the Midlands is prepared to take a Pupil in his office, where a good general experience—water supply, sewerage, and road construction—could be obtained. Moderate premium. Apply Box No. 1,501, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,359)

THE URBAN DISTRICT COUNCIL OF BARNES.
ANNUAL CONTRACTS.

The above Council is prepared to receive Tenders for the Supply of the following for the twelve months ending 31st March, 1916:

1. Broken Guernsey or Alderney Granite.
2. Broken Pit Flints and Thames Ballast.
3. Horses and Carts on Hire.
4. Disinfectants.
5. Ironmongery, &c.
7. Portland Cement.
8. Forage and Litter.
9. Granite Kerb and Channel.
11. Oils, Paints, &c.
12. Stoneware Pipes, &c.

Particulars and Forms of Tender may be obtained of the Engineer and Surveyor at the Council House, where Tenders, sealed and endorsed "Tender for ....," must be sent in not later than twelve o'clock noon on Monday, the 8th day of March, 1915. No Tender will be considered except on the prescribed Form.

The Council will not be bound to accept the lowest or any Tender.

(By order)

G. BRUCE TOMES, Assoc.M.Inst.C.E.,
Engineer and Surveyor.

The Council House,
High-street,
Mortlake, S.W. (2,362)

DESBOROUGH URBAN DISTRICT COUNCIL.

The above Council invite Tenders for the supply of :—

Broken Granite.
Slag.
Gravel.
Sanitary Pipes, &c.
Blue Bricks and Paviors.
Portland Cement.

Particulars and Forms of Tender may be obtained from T. F. Parker, Deputy Surveyor, Council Offices, Desborough.

Tenders, sealed and endorsed, must be delivered to the above not later than Wednesday, February 24, 1915.

Samples must accompany Tenders for Road Materials.

The Council do not bind themselves to accept the lowest or any Tender.

(By order of the Council)

EUSTACE R. LANE,
Clerk.

George-street, Kettering.
February 10, 1915. (2,360)

BOROUGH OF CHEPPING WYCOMBE
WATER DEPARTMENT.

The Corporation invites Tenders for the Supply of Galvanised Tubes, Bib and Stop Cocks, and Valve and Stopcock Boxes for the year April 1st, 1915, to March 31st, 1916.

Particulars and Form of Tender may be obtained at the Office of the undersigned, to whom Tenders, endorsed "Waterworks Stores," must be delivered by Saturday, March 6th, 1915.

T. J. RUSHBROOKE,
Waterworks Engineer.

Easton-street,
High Wycombe.
February 9, 1915. (2,353)

ENGINEERING JOTTINGS.*

7. THE CONTROL OF FLOODS.

By HERBERT G. COLLES, Assoc.M.Inst.C.E.

It is not within man's power to control rainfall or tidal waves, but it is possible to increase or control flood water and river pollution, although a good deal has been done. Why is this? Because the local authorities have given no general power to deal with pollution or to deal with floods, and even where powers were given they could be used only [illegible]. The municipal councillor, a very able watchdog of rates, on the other hand, compiled with every desire to do good, keep the several authorities up to their duties. The pressure of ratepayers' bills and their constant appeal for local economy [illegible] and control.

That unnecessary floods do very often occur to the loss of many interests in certain localities is not to be disputed, although the loss to ratepayers may be [illegible] forget the calamity when it is past. At the time of a drought people wish for rain, and plenty of it; floods seem very remote and not of sufficient moment to worry about. Thus even a flood inflicting [illegible] ords a few days' [illegible] long enough to compel the sustained attention of a majority of the inhabitants, but long enough to decide [illegible] learnedly to give out how many tons of rain per acre fell in an hour. Some of these tons of rainfall are badly wanted at times of drought; but, of course, all of them have been allowed to escape, or [illegible] or controlling having been carried out. In Egypt the Government acts differently, and the Nile is controlled to the immense benefit of that country. It does not seem a good excuse for inaction that here our waterways are insignificant compared to that great river. The fact is that the care of the waterways of our country, generally speaking, is absolutely neglected from want of someone strong in purpose and authority determined to inaugurate a system of control.

There was a Select Committee appointed by the House of Lords in 1877 to inquire into the operation of existing statutes in regard to the formation of, and proceedings by, Commissioners of Sewers, and Conservancy, Drainage and River Navigation Boards. The evidence was not only interesting, but most convincing of the necessity for dealing with floods; but no legislation has been passed, although Conservancy Bills were introduced into Parliament in 1881 and 1882.

The Royal Commission on Sewage Disposal, appointed in 1898, reported in favour of [illegible] River Boards with the widest [illegible] powers. That is something but no Act [illegible] been ground out of the legislative mill.

It is quite impossible for riparian owners, as individuals, to do what is necessary to the rivers to prevent flood. This is not to be wondered at [illegible] see of men [illegible] to agree upon what should be done, and still less upon what the individual apportionment of the cost of the work should be. These powers must be conferred upon bodies having authority to clean out, straighten, embank or divert rivers and streams as may appear to be most desirable to them.

Perhaps however the great stumbling block to the way of legislation has been the devising of an equitable rating scheme. The bills of 1881 and 1882 provided for the division of the country into three classes of lands, viz., lowlands, midlands and uplands, those lands subject, in fact, to ordinary floods, those to occasional floods, and those to exemption from floods. Whatever the rating scheme eventually decided upon, it can scarcely be more revolutionary than much of the ordinary non-party output of the times, everyone has moved since the 'eighties.

Here is a question for economists. How much capital expenditure on works might be spent to save a loss, say, of £5,000 once in every ten years? There are cases where an initial expenditure of £5,000 would prevent a disastrous flood in a town for a century. Yet, instead of the outlay of a penny in preventative measures, the recurring flood has to be submitted to because there is no power to move. Prehistoric man, doubtless, took the precaution of having his hut or cave above flood height; but we build our dwellings close to the ordinary flowing stream, assumed—but unconcerned that [illegible] time a [illegible] will be [illegible] a flood [illegible] will be trouble.

Prehistoric man, too, did not build obstructive bridges to dam back the flood water; nor did he throw all manner of rubbish into his river—at least we hope not. Think of the horror that would be caused in one of our county boroughs if someone tipped up a barrowful of garden refuse in the middle [illegible] kinds of rubbish because people generally think it [illegible]

What [illegible] the [illegible] flood water? Of course it is at present impounded in reservoirs for the feeding of canals, and the water supply of towns. Could [illegible] be [illegible] for [illegible] purposes?

As [illegible] may be flowing along above, that the underlying permeable strata is full to overflowing with water—[illegible] with advantage, and flood water poured into the penetrated receptive strata, so that the natural under- [illegible] property [illegible]. It is known that the tendency of modern land drainage [illegible] into the rivers and streams, and this naturally prevents the percolation of water into the strata so freely as formerly. Where it is known that a shortage in underground water exists, it would be well [illegible] be [illegible] to pay.

Powers granted to Rivers Boards for the control of floods would bring into prominence the question of the establishment and conservation of public water supplies, the use of any available water power, the regulation of boating and pleasure facilities, the consideration of navigation projects, the cultivation of fisheries, and a new outlet for the employment of [illegible]

For "Jottings" 1-6, see issues of April 24th, May 1st, May 8th, May 15th, June 5th, and July 10th, 1914.

ENGINEERING OPERATIONS FOR THE PREVENTION OF MALARIA.*

By Frank Dudley Evans, Assoc.M.Inst.C.E.

Anything which relates to the health of communities and labour forces is of importance to engineers, but the disease referred to in this paper—malaria—is of particular interest to them. The effects of malaria are often terrible, and may lead to very high death-rates. Its effect on works in new countries is greatly to increase their first cost and cost of maintenance, and it may lead to their abandonment.

Malaria occurs more or less in all warm climates, and is caused by parasites of the blood which are injected by anopheline mosquitoes. These mosquitoes first take the parasites from infected man when sucking blood; thus part of the life of the parasite is spent in man and part in the mosquito. Quinine is the remedy for malaria. No attempts to transmit malaria, except through the agency of mosquitoes, have been successful.

Mosquitoes are distinguished from other insects by various characteristics, but, like other insects, their life is divided into four stages—the egg, the larva, the pupa, and the imago. The egg is laid on water and develops into the imago, or adult winged insect, in about ten days. Mosquitoes are favoured by certain conditions and diminished by others.

The principal families of mosquitoes that concern man are those belonging to the groups *Culex*, *Stegomyia*, and *Anopheline*. Some *Culex* mosquitoes carry elephantiasis; some *Stegomyia* mosquitoes carry yellow fever; some anopheline mosquitoes carry malaria.

Anopheline larvæ and adults may easily be distinguished from *Culex* and *Stegomyia*. They are, as a rule, swamp breeders; hence the long-observed association of marshes with malaria.

The measures to combat and prevent malaria are: (1) Destruction of anopheline mosquitoes, either of adults or larvæ; (2) protection of man from the bites of infected mosquitoes; (3) Prevention of mosquito infection by suitable treatment of infected man.

Most malarious countries have applied, to some extent, one or all of these measures. Quinine may be used as a remedy and a preventive. Screening is effective in keeping mosquitoes away from man under certain conditions. Mosquito larvæ may be killed by oiling or poisoning their breeding-places, or breeding-places such as water vessels may be screened.

The most important method of reducing anophelines is by drying land by means of thorough drainage. In hill-land subject to heavy rainfall such work presents many novel problems, but has been successfully accomplished in the Federated Malay States at a reasonable cost.

Ravines in the Malay States, unless exceptional, can only be laid dry by a continuous drain running completely round the hill-foot, cut on a line at a little above the wet surface level. Open earth or masonry drains are useless for the purpose, and it has been found that the only way to construct permanent hill-foot drains is to use agricultural drain-pipes as subsoil drains, and to provide outlet drains of open masonry or subsoil pipes to carry off their discharge. The pipes are proportioned to run not more than one-quarter full in ordinary dry weather (one-fifth full for drains over 6 in. in diameter). The use of pipe drains less than 4 in. in diameter is not ordinarily advisable owing to the liability of their choking. The pipes are laid at a depth of 3 ft. to 4 ft. (or even deeper on steep slopes); they have been laid at the heads of ravines on slopes of 1 in 3 with satisfactory results.

Trees must be removed from the vicinity of pipe drains, as their roots may grow into and choke the pipes. Undergrowth and long grass should not be allowed to grow up for the same reason.

As economy is all-important in anti-malarial work, it is rarely possible to provide masonry drains large enough to carry all flood water, and these are, therefore, usually calculated to run one-sixth to one-fifth full in ordinary dry weather, and are surcharged during floods. An inexpensive and thoroughly efficient type of drain has been evolved to meet the conditions, this being formed of concrete blocks of half-egg shape laid close but unjointed. The blocks are laid without foundations, even on bad ground in flowing water. Should they move out of line or gradient, it is easy to reset them correctly when the surrounding ground has settled, after which they give no trouble; but resetting is rarely necessary.

The principal difficulty in draining hill-land lies in maintaining the drained surface undamaged. After some years' experience it has been found that the most economical method is the use of grass kept close cut. Small masonry dams are used in rock cuttings, and timber dams are used under certain circumstances. The method to be used depends on the quantity of silt carried by flood water. With proper care open drains may be connected to subsoil drains if necessary. Maintenance of drainage work is most important, as small faults, if neglected, may cause a whole system to be ineffective.

The co-operation of engineering, land and medical authorities is necessary to success in carrying out measures directed against malaria; but engineers can effect much on construction work by giving effect to a few simple rules. Two important problems in malarious hill countries are those connected with the enormous quantities of silt which are washed off agricultural estates and mine tailings, which, if not dealt with, may do immense damage, and ruin large tracts of country.

* Abstract of paper read at last Tuesday meeting of the Institution of Civil Engineers.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. W. H. Matthews Jones, City Engineer and Surveyor, Chester.

ANNUAL MEETING AND DINNER (NORTHERN DIVISION).

The general and annual meeting will be held at the Town Hall, Newcastle-upon-Tyne, at 2.30 p.m. to-morrow (Saturday), for the discussion of general business. The meeting will be followed by the annual dinner, to be held at the Royal Turk's Head Hotel, Grey-street, at 6 o'clock p.m.

John Robinson,
Darlington. *Hon. District Secretary.*

The next meeting of the council will be held in London on Friday, February 26th.

ROYAL SANITARY INSTITUTE.

MANCHESTER MEETING.

At a meeting of the Royal Sanitary Institute to be held at Manchester on Friday next, a discussion on "The Construction of Sewers," which will be illustrated by lantern slides, will be opened by Mr. S. S. Platt, M.Inst.C.E., borough engineer of Rochdale, and on "Housing from the Sanitary Inspector's Standpoint," by Mr. H. Dryland, of the Manchester Sanitary Department.

The chair will be taken at 7 p.m. by Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A.

On the following day the chairman of the Rivers Committee of the corporation, Alderman Frowde, has kindly consented to arrange for the members to inspect an interesting section of the Manchester main drainage scheme.
